# Babel, a multilingual package for use with LATEX's standard document classes\*

Johannes Braams Kersengaarde 33 2723 BP Zoetermeer The Netherlands babel@braams.xs4all.nl

Printed July 6, 2008

#### Abstract

The standard distribution of LATEX contains a number of document classes that are meant to be used, but also serve as examples for other users to create their own document classes. These document classes have become very popular among LATEX users. But it should be kept in mind that they were designed for American tastes and typography. At one time they contained a number of hard-wired texts. This report describes babel, a package that makes use of the new capabilities of TeX version 3 to provide an environment in which documents can be typeset in a language other than US English, or in more than one language.

# 1 The user interface

The user interface of this package is quite simple. It consists of a set of commands that switch from one language to another, and a set of commands that deal with shorthands. It is also possible to find out what the current language is.

\selectlanguage

When a user wants to switch from one language to another he can do so using the macro \selectlanguage. This macro takes the language, defined previously by a language definition file, as its argument. It calls several macros that should be defined in the language definition files to activate the special definitions for the language chosen.

otherlanguage

The environment otherlanguage does basically the same as \selectlanguage, except the language change is local to the environment. This environment is required for intermixing left-to-right typesetting with right-to-left typesetting. The language to switch to is specified as an argument to \begin{otherlanguage}.

\foreignlanguage

The command \foreignlanguage takes two arguments; the second argument is a phrase to be typeset according to the rules of the language named in its first argument. This command only switches the extra definitions and the hyphenation rules for the language, *not* the names and dates.

otherlanguage\*

In the environment otherlanguage\* only the typesetting is done according to the rules of the other language, but the text-strings such as 'figure', 'table', etc. are left as they were set outside this environment.

hyphenrules

The environment hyphenrules can be used to select *only* the hyphenation rules to be used. This can for instance be used to select 'nohyphenation', provided that in language.dat the 'language' nohyphenation is defined by loading serohyph.tex.

\languagename

The control sequence \languagename contains the name of the current language.

\iflanguage

If more than one language is used, it might be necessary to know which language is active at a specific time. This can be checked by a call to \iflanguage. This macro takes three arguments. The first argument is the name of a language; the second and third arguments are the actions to take if the result of the test is true or false respectively.

\useshorthands

The command \useshorthands initiates the definition of user-defined shorthand sequences. It has one argument, the character that starts these personal shorthands.

\defineshorthand

The command \defineshorthand takes two arguments: the first is a oneor two-character shorthand sequence, and the second is the code the shorthand should expand to.

\aliasshorthand

The command \aliasshorthand can be used to let another character perform the same functions as the default shorthand character. If one prefers for example to use the character / over " in typing polish texts, this can be achieved by entering \aliasshorthand{"}{}. Please note that the substitute shorthand character must have been declared in the preamble of your document, using a command such as \useshorthands{/} in this example.

\languageshorthands

The command \languageshorthands can be used to switch the shorthands on the language level. It takes one argument, the name of a language. Note that for this to work the language should have been specified as an option when loading the babel package.

\shorthandon \shorthandoff It is sometimes necessary to switch a shorthand character off temporarily, because it must be used in an entirely different way. For this purpose, the user commands \shorthandoff and \shorthandon are provided. They each take a list of characters as their arguments. The command \shorthandoff sets the \catcode for each of the characters in its argument to other (12); the command \shorthandon sets the \catcode to active (13). Both commands only work on 'known' shorthand characters. If a character is not known to be a shorthand character its category code will be left unchanged.

\languageattribute

This is a user-level command, to be used in the preamble of a document (after

\usepackage[...]{babel}), that declares which attributes are to be used for a given language. It takes two arguments: the first is the name of the language; the second, a (list of) attribute(s) to used. The command checks whether the language is known in this document and whether the attribute(s) are known for this language.

### 1.1 Languages supported by Babel

In the following table all the languages supported by Babel are listed, together with the names of the options with which you can load babel for each language.

Language	Option(s)
Afrikaans	afrikaans
Bahasa	bahasa, indonesian, indon, bahasai, bahasam, malay,
Danasa	meyalu
Basque	basque
Breton	breton
Bulgarian	bulgarian
Catalan	catalan
Croatian	croatian
Czech	czech
Danish	danish
Dutch	dutch
English	english, USenglish, american, UKenglish, british,
Liighan	canadian, australian, newzealand
Esperanto	esperanto
Estonian	estonian
Finnish	finnish
French	french, francais, canadien, acadian
Galician	galician
German	austrian, german, germanb, ngerman, naustrian
Greek	greek, polutonikogreek
Hebrew	hebrew
Hungarian	magyar, hungarian
Icelandic	icelandic
Interlingua	interlingua
Irish Gaelic	irish
Italian	italian
Latin	latin
Lower Sorbian	lowersorbian
North Sami	samin
Norwegian	norsk, nynorsk
Polish	polish
Portuguese	portuges, portuguese, brazilian, brazil
Romanian	romanian
Russian	russian
Scottish Gaelic	scottish

Language	$\operatorname{Option}(s)$
Spanish	spanish
Slovakian	slovak
Slovenian	slovene
Swedish	swedish
$\operatorname{Serbian}$	serbian
$\operatorname{Turkish}$	turkish
Ukrainian	ukrainian
Upper Sorbian	uppersorbian
Welsh	welsh

For some languages babel supports the options activeacute and activegrave; for typestting Russian texts, babel knows about the options LWN and LCY to specify the fontencoding of the cyrillic font used. Currently only LWN is supported.

#### 1.2 Workarounds

If you use the document class book and you use \ref inside the argument of \chapter, LATEX will keep complaining about an undefined label. The reason is that the argument of \ref is passed through \uppercase at some time during processing. To prevent such problems, you could revert to using uppercase labels, or you can use \lowercase{\ref{foo}} inside the argument of \chapter.

# 2 Changes for $\LaTeX 2_{\varepsilon}$

With the advent of  $\LaTeX$   $2\varepsilon$  the interface to babel in the preamble of the document has changed. With  $\LaTeX$   $2\varepsilon$  one used to call up the babel system with a line such as:

\documentstyle[dutch,english]{article}

which would tell LATEX that the document would be written in two languages, Dutch and English, and that English would be the first language in use.

The  $\LaTeX 2_{\varepsilon}$  way of providing the same information is:

```
\documentclass{article}
\usepackage[dutch,english]{babel}
```

or, making  $\mathsf{dutch}$  and  $\mathsf{english}$  global options in order to let other packages detect and use them:

```
\documentclass[dutch,english]{article}
\usepackage{babel}
\usepackage{varioref}
```

In this last example, the package varioref will also see the options and will be able to use them.

# 3 Changes in Babel version 3.7

In Babel version 3.7 a number of bugs that were found in version 3.6 are fixed. Also a number of changes and additions have occurred:

- Shorthands are expandable again. The disadvantage is that one has to type '{}a when the acute accent is used as a shorthand character. The advantage is that a number of other problems (such as the breaking of ligatures, etc.) have vanished.
- Two new commands, \shorthandon and \shorthandoff have been introduced to enable to temporarily switch off one or more shorthands.
- Support for typesetting Greek has been enhanced. Code from the kdgreek package (suggested by the author) was added and \greeknumeral has been added.
- Support for typesetting Basque is now available thanks to Juan Aguirregabiria.
- Support for typesetting Serbian with Latin script is now available thanks to Dejan Muhamedagić and Jankovic Slobodan.
- Support for typesetting Hebrew (and potential support for typesetting other right-to-left written languages) is now available thanks to Rama Porrat and Boris Lavva.
- Support for typesetting Bulgarian is now available thanks to Georgi Boshnakov.
- Support for typesetting Latin is now available, thanks to Claudio Beccari and Krzysztof Konrad Żelechowski.
- Support for typesetting North Sami is now available, thanks to Regnor Jernsletten.
- The options canadian, canadien and acadien have been added for Canadian English and French use.
- A language attribute has been added to the \mark... commands in order to make sure that a Greek header line comes out right on the last page before a language switch.
- Hyphenation pattern files are now read *inside a group*; therefore any changes a pattern file needs to make to lowercase codes, uppercase codes, and category codes are kept local to that group. If they are needed for the language, these changes will need to be repeated and stored in \extras...
- The concept of language attributes is introduced. It is intended to give the user some control over the features a language-definition file provides. Its first use is for the Greek language, where the user can choose the  $\pi o \lambda v \tau o \nu \kappa \acute{o}$  ("Polutoniko" or multi-accented) Greek way of typesetting texts. These attributes will possibly find wider use in future releases.
- The environment hyphenrules is introduced.

- The syntax of the file language.dat has been extended to allow (optionally) specifying the font encoding to be used while processing the patterns file.
- The command \providehyphenmins should now be used in language definition files in order to be able to keep any settings provided by the pattern file

# 4 Changes in Babel version 3.6

In Babel version 3.6 a number of bugs that were found in version 3.5 are fixed. Also a number of changes and additions have occurred:

- A new environment otherlanguage\* is introduced. it only switches the 'specials', but leaves the 'captions' untouched.
- The shorthands are no longer fully expandable. Some problems could only be solved by peeking at the token following an active character. The advantage is that '{}a works as expected for languages that have the 'active.
- Support for typesetting french texts is much enhanced; the file francais.ldf is now replaced by frenchb.ldf which is maintained by Daniel Flipo.
- Support for typesetting the russian language is again available. The language definition file was originally developed by Olga Lapko from CyrTUG. The fonts needed to typeset the russian language are now part of the babel distribution. The support is not yet up to the level which is needed according to Olga, but this is a start.
- Support for typesetting greek texts is now also available. What is offered in this release is a first attempt; it will be enhanced later on by Yannis Haralambous.
- in babel 3.6j some hooks have been added for the development of support for Hebrew typesetting.
- Support for typesetting texts in Afrikaans (a variant of Dutch, spoken in South Africa) has been added to dutch.ldf.
- Support for typesetting Welsh texts is now available.
- A new command \aliasshorthand is introduced. It seems that in Poland various conventions are used to type the necessary Polish letters. It is now possible to use the character / as a shorthand character instead of the character ", by issuing the command \aliasshorthand{"}{/}.
- The shorthand mechanism now deals correctly with characters that are already active.
- Shorthand characters are made active at \begin{document}, not earlier. This is to prevent problems with other packages.
- A preambleonly command \substitutefontfamily has been added to create .fd files on the fly when the font families of the Latin text differ from the families used for the Cyrillic or Greek parts of the text.

- Three new commands \LdfInit, \ldf@quit and \ldf@finish are introduced that perform a number of standard tasks.
- In babel 3.6k the language Ukrainian has been added and the support for Russian typesetting has been adapted to the package 'cyrillic' to be released with the December 1998 release of  $\text{IAT}_{\text{FX}} 2_{\mathcal{E}}$ .

## 5 Changes in Babel version 3.5

In Babel version 3.5 a lot of changes have been made when compared with the previous release. Here is a list of the most important ones:

- the selection of the language is delayed until \begin{document}, which means you must add appropriate \selectlanguage commands if you include \hyphenation lists in the preamble of your document.
- babel now has a language environment and a new command \foreignlanguage;
- the way active characters are dealt with is completely changed. They are called 'shorthands'; one can have three levels of shorthands: on the user level, the language level, and on 'system level'. A consequence of the new way of handling active characters is that they are now written to auxiliary files 'verbatim';
- A language change now also writes information in the .aux file, as the change might also affect typesetting the table of contents. The consequence is that an .aux file generated by a LaTeX format with babel preloaded gives errors when read with a LaTeX format without babel; but I think this probably doesn't occur;
- babel is now compatible with the inputenc and fontenc packages;
- the language definition files now have a new extension, ldf;
- the syntax of the file language.dat is extended to be compatible with the french package by Bernard Gaulle;
- each language definition file looks for a configuration file which has the same name, but the extension .cfg. It can contain any valid LATEX code.

# 6 The interface between the core of babel and the language definition files

In the core of the babel system, several macros are defined for use in language definition files. Their purpose is to make a new language known.

\addlanguage

The macro \addlanguage is a non-outer version of the macro \newlanguage, defined in plain.tex version 3.x. For older versions of plain.tex and lplain.tex a substitute definition is used.

\adddialect

The macro \addialect can be used when two languages can (or must) use the same hyphenation patterns. This can also be useful for languages for which no patterns are preloaded in the format. In such cases the default behaviour of the babel system is to define this language as a 'dialect' of the language for which the patterns were loaded as \language0.

The language definition files must conform to a number of conventions, because these files have to fill in the gaps left by the common code in babel.def, i.e., the definitions of the macros that produce texts. Also the language-switching possibility which has been built into the babel system has its implications.

The following assumptions are made:

- Some of the language-specific definitions might be used by plain TEX users, so the files have to be coded so that they can be read by both LATEX and plain TEX. The current format can be checked by looking at the value of the macro \fmtname.
- The common part of the babel system redefines a number of macros and environments (defined previously in the document style) to put in the names of macros that replace the previously hard-wired texts. These macros have to be defined in the language definition files.
- The language definition files define five macros, used to activate and deactivate the language-specific definitions. These macros are \\( (lang \) hyphenmins, \\captions \( (lang \), \\date \( (lang \), \\extras \( (lang \)) and \\noextras \( (lang \)); where \( (lang \)) is either the name of the language definition file or the name of the LATEX option that is to be used. These macros and their functions are discussed below.
- When a language definition file is loaded, it can define  $\log(lang)$  to be a dialect of  $\log(lang)$  is undefined.
- The language definition files can be read in the preamble of the document, but also in the middle of document processing. This means that they have to function independently of the current \catcode of the @ sign.

The macro \providehyphenmins should be used in the language definition files to set the \lefthyphenmin and \righthyphenmin. This macro will check whether these parameters were provided by the hyphenation file before it takes any action.

The macro  $\langle lang \rangle$  hyphenmins is used to store the values of the  $\$ lefthyphenmin and  $\$ righthyphenmin.

The macro  $\backslash \text{captions} \langle lang \rangle$  defines the macros that hold the texts to replace the original hard-wired texts.

The macro  $\langle lang \rangle$  defines  $\langle lang \rangle$  and

The macro  $\ensuremath{\mbox{\mbox{$\sim$}}} \langle lang \rangle$  contains all the extra definitions needed for a specific language.

Because we want to let the user switch between languages, but we do not know what state  $T_EX$  might be in after the execution of  $\langle x_EX \rangle$ , a macro that brings  $T_EX$  into a predefined state is needed. It will be no surprise that the name of this macro is  $\langle x_EX \rangle$ .

This is a command to be used in the language definition files for declaring a language attribute. It takes three arguments: the name of the language, the attribute to be defined, and the code to be executed when the attribute is to be used.

To postpone the activation of the definitions needed for a language until the beginning of a document, all language definition files should use \main@language

 $\verb|\providehyphenmins||$ 

\langhyphenmins

\captionslang

\datelang

\noextraslang

\bbl@declare@ttribute

\main@language

instead of \selectlanguage. This will just store the name of the language, and the proper language will be activated at the start of the document.

\ProvidesLanguage

The macro  $\ProvidesLanguage$  should be used to identify the language definition files. Its syntax is similar to the syntax of the  $\ProvidesPackage$ .

\LdfInit

The macro \LdfInit performs a couple of standard checks that must be made at the beginning of a language definition file, such as checking the category code of the @-sign, preventing the .ldf file from being processed twice, etc.

\ldf@quit

The macro \ldf@quit does work needed if a .ldf file was processed earlier. This includes resetting the category code of the @-sign, preparing the language to be activated at \begin{document} time, and ending the input stream.

\ldf@finish

The macro \ldf@finish does work needed at the end of each .ldf file. This includes resetting the category code of the @-sign, loading a local configuration file, and preparing the language to be activated at \begin{document} time.

\loadlocalcfg

After processing a language definition file, LaTeX can be instructed to load a local configuration file. This file can, for instance, be used to add strings to  $\langle captions \langle lang \rangle$  to support local document classes. The user will be informed that this configuration file has been loaded. This macro is called by  $\langle df@finish.$ 

\substitutefontfamily

This command takes three arguments, a font encoding and two font family names. It creates a font description file for the first font in the given encoding. This .fd file will instruct LATEX to use a font from the second family when a font from the first family in the given encoding seems to be needed.

#### 6.1 Support for active characters

In quite a number of language definition files, active characters are introduced. To facilitate this, some support macros are provided.

\initiate@active@char

The internal macro \initiate@active@char is used in language definition files to instruct LATEX to give a character the category code 'active'. When a character has been made active it will remain that way until the end of the document. Its definition may vary.

\bbl@activate

The command \bbl@activate is used to change the way an active character expands. \bbl@activate 'switches on' the active behaviour of the character. \bbl@deactivate lets the active character expand to its former (mostly) non-active self.

\declare@shorthand

The macro \declare@shorthand is used to define the various shorthands. It takes three arguments: the name for the collection of shorthands this definition belongs to; the character (sequence) that makes up the shorthand, i.e. ~ or "a; and the code to be executed when the shorthand is encountered.

\bbl@add@special \bbl@remove@special The TeXbook states: "Plain TeX includes a macro called \dospecials that is essentially a set macro, representing the set of all characters that have a special category code." [1, p. 380] It is used to set text 'verbatim'. To make this work if more characters get a special category code, you have to add this character to the macro \dospecial. IATEX adds another macro called \@sanitize representing the same character set, but without the curly braces. The macros \bbl@add@special $\langle char \rangle$  and \bbl@remove@special $\langle char \rangle$  add and remove the character  $\langle char \rangle$  to these two sets.

#### 6.2 Support for saving macro definitions

Language definition files may want to re define macros that already exist. Therefor a mechanism for saving (and restoring) the original definition of those macros is provided. We provide two macros for this<sup>1</sup>.

\babel@save

To save the current meaning of any control sequence, the macro \babel@save is provided. It takes one argument,  $\langle csname \rangle$ , the control sequence for which the meaning has to be saved.

\babel@savevariable

A second macro is provided to save the current value of a variable. In this context, anything that is allowed after the  $\$ the primitive is considered to be a variable. The macro takes one argument, the  $\langle variable \rangle$ .

The effect of the preceding macros is to append a piece of code to the current definition of \originalTeX. When \originalTeX is expanded, this code restores the previous definition of the control sequence or the previous value of the variable.

### 6.3 Support for extending macros

\addto

The macro  $\addto{\langle control\ sequence\rangle}{\langle TEX\ code\rangle}$  can be used to extend the definition of a macro. The macro need not be defined. This macro can, for instance, be used in adding instructions to a macro like \extrasenglish.

#### 6.4 Macros common to a number of languages

\allowhyphens

In a couple of European languages compound words are used. This means that when TEX has to hyphenate such a compound word, it only does so at the '-' that is used in such words. To allow hyphenation in the rest of such a compound word, the macro \allowhyphens can be used.

\set@low@box

For some languages, quotes need to be lowered to the baseline. For this purpose the macro \set@low@box is available. It takes one argument and puts that argument in an \hbox, at the baseline. The result is available in \box0 for further processing.

\save@sf@q

Sometimes it is necessary to preserve the \spacefactor. For this purpose the macro \save@sf@q is available. It takes one argument, saves the current spacefactor, executes the argument, and restores the spacefactor.

\bbl@frenchspacing \bbl@nonfrenchspacing

The commands \bbl@frenchspacing and \bbl@nonfrenchspacing can be used to properly switch French spacing on and off.

# 7 Compatibility with german.sty

The file <code>german.sty</code> has been one of the sources of inspiration for the babel system. Because of this I wanted to include <code>german.sty</code> in the babel system. To be able to do that I had to allow for one incompatibility: in the definition of the macro <code>\selectlanguage</code> in <code>german.sty</code> the argument is used as the  $\langle number \rangle$  for an <code>\ifcase</code>. So in this case a call to <code>\selectlanguage</code> might look like <code>\selectlanguage(\german)</code>.

In the definition of the macro \selectlanguage in babel.def the argument is used as a part of other macronames, so a call to \selectlanguage now looks

<sup>&</sup>lt;sup>1</sup>This mechanism was introduced by Bernd Raichle.

like \selectlanguage{german}. Notice the absence of the escape character. As of version 3.1a of babel both syntaxes are allowed.

All other features of the original german.sty have been copied into a new file, called germanb.sty<sup>2</sup>.

Although the babel system was developed to be used with LATEX, some of the features implemented in the language definition files might be needed by plain TEX users. Care has been taken that all files in the system can be processed by plain TEX.

## 8 Compatibility with ngerman.sty

When used with the options ngerman or naustrian, babel will provide all features of the package ngerman. There is however one exception: The commands for special hyphenation of double consonants ("ff etc.) and ck ("ck), which are no longer required with the new German orthography, are undefined. With the ngerman package, however, these commands will generate appropriate warning messages only.

# 9 Compatibility with the french package

It has been reported to me that the package french by Bernard Gaulle (gaulle@idris.fr) works together with babel. On the other hand, it seems not to work well together with a lot of other packages. Therefore I have decided to no longer load french.ldf by default. Instead, when you want to use the package by Bernard Gaulle, you will have to request it specifically, by passing either frenchle or frenchpro as an option to babel.

#### 10 Identification

The file babel.sty<sup>3</sup> is meant for  $\LaTeX 2_{\varepsilon}$ , therefor we make sure that the format file used is the right one.

\ProvidesLanguage

The identification code for each file is something that was introduced in  $\LaTeX 2_{\mathcal{E}}$ . When the command  $\ProvidesFile$  does not exist, a dummy definition is provided temporarily. For use in the language definition file the command  $\ProvidesLanguage$  is defined by babel.

```
10.1 \( *!package \)
10.2 \\ ifx\ProvidesFile\Qundefined
10.3 \\ def\ProvidesFile#1[#2 #3 #4]{%
10.4 \\ wlog{File: #1 #4 #3 <#2>}%
10.5 \( *kernel & patterns \)
10.6 \\ \toks8{Babel <#3> and hyphenation patterns for }%
10.7 \( /kernel & patterns \)
10.8 \\ \left\ProvidesFile\Qundefined
10.9 \\ \}
```

 $<sup>^2{\</sup>rm The}$  'b' is added to the name to distinguish the file from Partls' file.

 $<sup>^3</sup>$ The file described in this section is called babel.dtx, has version number v3.8l and was last revised on 2008/03/16.

As an alternative for \ProvidesFile we define \ProvidesLanguage here to be used in the language definition files.

```
10.10 (*kernel)
10.11 \def\ProvidesLanguage#1[#2 #3 #4] {%
10.12 \wlog{Language: #1 #4 #3 <#2>}%
10.13 }
10.14 \else
```

In this case we save the original definition of \ProvidesFile in \bbl@tempa and restore it after we have stored the version of the file in \toks8.

When \ProvidesFile is defined we give \ProvidesLanguage a similar definition.

```
\def\ProvidesLanguage#1{%
10.22
         \begingroup
10.23
           \catcode'\ 10 %
10.24
           \@makeother\/%
10.25
           \@ifnextchar[%]
10.26
10.27
             {\@provideslanguage{#1}}{\@provideslanguage{#1}[]}}
10.28
       \def\@provideslanguage#1[#2]{%
         \wlog{Language: #1 #2}%
         \expandafter\xdef\csname ver@#1.ldf\endcsname{#2}%
10.31
         \endgroup}
10.32 (/kernel)
10.33 \fi
10.34 (/!package)
```

Identify each file that is produced from this source file.

# 11 The Package File

In order to make use of the features of  $\LaTeX 2_{\mathcal{E}}$ , the babel system contains a package file, babel.sty. This file is loaded by the \usepackage command and defines all the language options known in the babel system. It also takes care of a number of compatibility issues with other packages.

### 11.1 Language options

```
11.1 (*package)
 11.2 \ifx\LdfInit\Qundefined\input babel.def\relax\fi
          For all the languages supported we need to declare an option.
 11.3 \DeclareOption{acadian}{\input{frenchb.ldf}}
 11.4 \DeclareOption{albanian}{\input{albanian.ldf}}
 11.5 \DeclareOption{afrikaans}{\input{dutch.ldf}}
 11.6 \DeclareOption{american}{\input{english.ldf}}
 11.7 \DeclareOption{australian}{\input{english.ldf}}
    Austrian is really a dialect of German.
 11.8 \DeclareOption{austrian}{\input{germanb.ldf}}
 11.9 \DeclareOption{bahasa}{\input{bahasai.ldf}}
11.10 \DeclareOption{indonesian}{\input{bahasai.ldf}}
11.11 \DeclareOption{indon}{\input{bahasai.ldf}}
11.12 \DeclareOption{bahasai}{\input{bahasai.ldf}}
11.13 \DeclareOption{malay}{\input{bahasam.ldf}}
11.14 \DeclareOption{meyalu} {\input{bahasam.ldf}}
11.15 \DeclareOption{bahasam}{\input{bahasam.ldf}}
11.16 \DeclareOption{basque}{\input{basque.ldf}}
11.17 \DeclareOption{brazil}{\input{portuges.ldf}}
11.18 \DeclareOption{brazilian}{\input{portuges.ldf}}
11.19 \DeclareOption{breton}{\input{breton.ldf}}
11.20 \label{lem:ldf} $$11.20 \end{thm} \hborder $$11.20 \end{thm} $$11.20 \end{th
11.21 \DeclareOption{bulgarian}{\input{bulgarian.ldf}}
11.22 \DeclareOption{canadian}{\input{english.ldf}}
11.23 \DeclareOption{canadien}{\input{frenchb.ldf}}
11.24 \DeclareOption{catalan}{\input{catalan.ldf}}
11.25 \DeclareOption{croatian}{\input{croatian.ldf}}
11.26 \DeclareOption{czech}{\input{czech.ldf}}
11.27 \DeclareOption{danish}{\input{danish.ldf}}
11.28 \DeclareOption{dutch}{\input{dutch.ldf}}
11.29 \verb|\DeclareOption{english}{ \langle input{english.ldf}}|
11.30 \DeclareOption{esperanto}{\input{esperanto.ldf}}
11.31 \DeclareOption{estonian}{\input{estonian.ldf}}
11.32 \DeclareOption{finnish}{\input{finnish.ldf}}
    The babel support or French used to be stored in francais.ldf; therefor the
    E<sup>A</sup>T<sub>E</sub>X2.09 option used to be francais. The hyphenation patterns may be loaded as
    either 'french' or as 'français'.
11.33 \DeclareOption{francais}{\input{frenchb.ldf}}
{\tt 11.34 \setminus DeclareOption\{frenchb\}\{\setminus input\{frenchb.ldf\}\}}
    With LATEX 2_{\mathcal{E}} we can now also use the option french and still call the file
    frenchb.ldf.
11.35 \DeclareOption{french}{\input{frenchb.ldf}}%
11.36 \DeclareOption{galician}{\input{galician.ldf}}
11.37 \DeclareOption{german}{\input{germanb.ldf}}
11.38 \DeclareOption{germanb}{\input{germanb.ldf}}
11.39 \DeclareOption{greek}{\input{greek.ldf}}
11.40 \DeclareOption{polutonikogreek}{%
11 41
           \input{greek.ldf}%
           \languageattribute{greek}{polutoniko}}
```

```
11.43 \DeclareOption{hebrew}{%
             \input{rlbabel.def}%
11.44
             \input{hebrew.ldf}}
11.45
    hungarian is just a synonym for magyar
11.46 \DeclareOption{hungarian}{\input{magyar.ldf}}
11.47 \DeclareOption{icelandic}{\input{icelandic.ldf}}
11.48 \DeclareOption{interlingua}{\input{interlingua.ldf}}
11.49 \DeclareOption{irish}{\input{irish.ldf}}
11.50 \DeclareOption{italian}{\input{italian.ldf}}
11.51 \DeclareOption{latin}{\input{latin.ldf}}
11.52 \DeclareOption{lowersorbian}{\input{lsorbian.ldf}}
11.53 %^^A\DeclareOption{kannada}{\input{kannada.ldf}}
11.54 \DeclareOption{magyar}{\input{magyar.ldf}}
11.55 %^^A\DeclareOption{nagari}{\input{nagari.ldf}}
    'New' German orthography, including Austrian variant:
11.56 \DeclareOption{naustrian}{\input{ngermanb.ldf}}
11.57 \DeclareOption{newzealand}{\input{english.ldf}}
11.58 \DeclareOption{ngerman}{\input{ngermanb.ldf}}
11.59 \DeclareOption{norsk}{\input{norsk.ldf}}
11.60 \DeclareOption{samin}{\input{samin.ldf}}
    For Norwegian two spelling variants are provided.
11.61 \DeclareOption{nynorsk}{\input{norsk.ldf}}
11.62 \DeclareOption{polish}{\input{polish.ldf}}
11.63 \DeclareOption{portuges}{\input{portuges.ldf}}
11.64 \DeclareOption{portuguese}{\input{portuges.ldf}}
11.65 \DeclareOption{romanian}{\input{romanian.ldf}}
11.66 \DeclareOption{russian}{\input{russianb.ldf}}
11.67 %^^A\DeclareOption{sanskrit}{\input{sanskrit.ldf}}
11.68 \DeclareOption{scottish}{\input{scottish.ldf}}
11.69 \DeclareOption{serbian}{\input{serbian.ldf}}
11.70 \DeclareOption{slovak}{\input{slovak.ldf}}
11.71 \DeclareOption{slovene}{\input{slovene.ldf}}
11.72 \DeclareOption{spanish}{\input{spanish.ldf}}
11.73 \DeclareOption{swedish}{\input{swedish.ldf}}
11.74 %^^A\DeclareOption{tamil}{\input{tamil.ldf}}
11.75 \DeclareOption{turkish}{\input{turkish.ldf}}
11.76 \DeclareOption{ukrainian}{\input{ukraineb.ldf}}
11.77 \DeclareOption{uppersorbian}{\input{usorbian.ldf}}
11.78 \label{lem:ldf} $$11.78 \end{equal} $$ \mathbb{C}_{n} \end{equal} $$ 11.78 \end{equal} $$ 1
11.79 \DeclareOption{UKenglish}{\input{english.ldf}}
11.80 \DeclareOption{USenglish}{\input{english.ldf}}
           For all those languages for which the option name is the same as the name of
    specified. If this doesn't succeed an error is signalled.
```

the language specific file we specify a default option, which tries to load the file

```
11.81 \DeclareOption*{%
      \InputIfFileExists{\CurrentOption.ldf}{}{%
11.82
11.83
         \PackageError{babel}{%
          Language definition file \CurrentOption.ldf not found}{%
11.84
11.85
           Maybe you misspelled the language option?}}%
11.86
```

Another way to extend the list of 'known' options for babel is to create the file bblopts.cfg in which one can add option declarations.

Apart from all the language options we also have a few options that influence the behaviour of language definition files.

The following options don't do anything themselves, they are just defined in order to make it possible for language definition files to check if one of them was specified by the user.

```
11.92 \DeclareOption{activeacute}{}
11.93 \DeclareOption{activegrave}{}
```

The next option tells babel to leave shorthand characters active at the end of processing the package. This is *not* the default as it can cause problems with other packages, but for those who want to use the shorthand characters in the preamble of their documents this can help.

11.94 \DeclareOption{KeepShorthandsActive}{}

The options have to be processed in the order in which the user specified them: 11.95 \ProcessOptions\*

In order to catch the case where the user forgot to specify a language we check whether \bbl@main@language, has become defined. If not, no language has been loaded and an error message is displayed.

```
11.96 \ifx\bbl@main@language\@undefined
11.97 \PackageError{babel}{%
```

```
You haven't specified a language option}{%
You need to specify a language, either as a global
11.100 option\MessageBreak
11.101 or as an optional argument to the \string\usepackage\space
11.102 command; \MessageBreak
11.103 You shouldn't try to proceed from here, type x to quit.}
```

To prevent undefined command errors when the user insists on continuing we load babel.def here. He should expect more errors though.

```
11.104 \quad \text{input{babel.def}} 
11.105 \quad \text{fi}
```

\substitutefontfamily The command \substitutefontfamily creates an .fd file on the fly. The first argument is an encoding mnemonic, the second and third arguments are font family names.

```
11.106 \def\substitutefontfamily#1#2#3{%
       \lowercase{\immediate\openout15=#1#2.fd\relax}%
11.107
       \immediate\write15{%
11.108
         \string\ProvidesFile{#1#2.fd}%
11.109
         [\the\year/\two@digits{\the\month}/\two@digits{\the\day}
11.110
          \space generated font description file]^^J
11.111
11.112
         \string\DeclareFontFamily{#1}{#2}{}^^J
11.113
         \string\DeclareFontShape{#1}{#2}{m}{n}{<->ssub * #3/m/n}{}^J
11.114
         \string\DeclareFontShape{#1}{#2}{m}{it}{<->ssub * #3/m/it}{}^^J
         \string\DeclareFontShape{#1}{#2}{m}{sl}{<->ssub * #3/m/sl}{}^^J
11.115
         \string\DeclareFontShape{#1}{#2}{m}{sc}{<->ssub * #3/m/sc}{}^^J
11.116
         \string\DeclareFontShape{#1}{#2}{b}{n}{<->ssub * #3/bx/n}{}^^J
11.117
11 118
         \string\DeclareFontShape{#1}{#2}{b}{it}{<->ssub * #3/bx/it}{}^^J
11.119
         \string\DeclareFontShape{#1}{#2}{b}{s1}{<->ssub * #3/bx/s1}{}^^J
```

```
11 120
      ጉ%
11.121
    \closeout15
11.122
11.123
    }
  This command should only be used in the preamble of a document.
```

11.124 \@onlypreamble\substitutefontfamily

11.125 (/package)

#### 12 The Kernel of Babel

The kernel of the babel system is stored in either hyphen.cfg or switch.def and babel.def. The file hyphen.cfg is a file that can be loaded into the format, which is necessary when you want to be able to switch hyphenation patterns. The file babel.def contains some TEX code that can be read in at run time. When babel.def is loaded it checks if hyphen.cfg is in the format; if not the file switch.def is loaded.

Because plain T<sub>F</sub>X users might want to use some of the features of the babel system too, care has to be taken that plain T<sub>F</sub>X can process the files. For this reason the current format will have to be checked in a number of places. Some of the code below is common to plain TEX and LATEX, some of it is for the LATEX case only.

When the command \AtBeginDocument doesn't exist we assume that we are dealing with a plain-based format. In that case the file plain.def is needed.

```
12.1 (*kernel | core)
12.2 \ \text{ifx} \ \text{AtBeginDocument} \ \text{Cundefined}
```

But we need to use the second part of plain.def (when we load it from switch.def) which we can do by defining \adddialect.

```
12.3 (kernel&!patterns) \def\adddialect{}
12.4 \input plain.def\relax
12.5 \fi
12.6 (/kernel | core)
```

Check the presence of the command \iflanguage, if it is undefined read the file switch.def.

```
12.7 (*core)
12.8 \ifx\iflanguage\@undefined
12.9 \input switch.def\relax
12.10 \fi
12.11 (/core)
```

#### Encoding issues (part 1) 12.1

The first thing we need to do is to determine, at \begin{document}, which latin fontencoding to use.

\latinencoding

When text is being typeset in an encoding other than 'latin' (OT1 or T1), it would be nice to still have Roman numerals come out in the Latin encoding. So we first assume that the current encoding at the end of processing the package is the Latin encoding.

```
\label{localization} \begin{split} &12.12 \; \big< *\texttt{core} \big> \\ &12.13 \; \big  \} \\ &\texttt{AtEndOfPackage} \big\{ \texttt{cfGencoding} \big\} \big\} \end{split}
```

But this might be overruled with a later loading of the package fontenc. Therefor we check at the execution of \begin{document} whether it was loaded with the T1 option. The normal way to do this (using \@ifpackageloaded) is disabled for this package. Now we have to revert to parsing the internal macro \@filelist which contains all the filenames loaded.

```
12.14 \AtBeginDocument{%

12.15 \gdef\latinencoding{OT1}%

12.16 \ifx\cf@encoding\bbl@t@one

12.17 \xdef\latinencoding{\bbl@t@one}%

12.18 \else

12.19 \@ifl@aded{\def}{t1enc}{\xdef\latinencoding{\bbl@t@one}}%

12.20 \fi

12.21 }
```

\latintext Then we can define the command \latintext which is a declarative switch to a latin font-encoding.

\textlatin This command takes an argument which is then typeset using the requested font encoding. In order to avoid many encoding switches it operates in a local scope.

We also need to redefine a number of commands to ensure that the right font encoding is used, but this can't be done before babel.def is loaded.

#### 12.2 Multiple languages

With TEX version 3.0 it has become possible to load hyphenation patterns for more than one language. This means that some extra administration has to be taken care of. The user has to know for which languages patterns have been loaded, and what values of \language have been used.

Some discussion has been going on in the TEX world about how to use \language. Some have suggested to set a fixed standard, i. e., patterns for each language should always be loaded in the same location. It has also been suggested to use the ISO list for this purpose. Others have pointed out that the ISO list contains more than 256 languages, which have not been numbered consecutively.

I think the best way to use \language, is to use it dynamically. This code implements an algorithm to do so. It uses an external file in which the person who maintains a TEX environment has to record for which languages he has hyphenation patterns and in which files these are stored<sup>4</sup>. When hyphenation exceptions

 $<sup>^4</sup>$  This is because different operating systems sometimes use  $\mathit{very}$  different file-naming conventions.

are stored in a separate file this can be indicated by naming that file after the file with the hyphenation patterns.

This "configuration file" can contain empty lines and comments, as well as lines which start with an equals (=) sign. Such a line will instruct LATEX that the hyphenation patterns just processed have to be known under an alternative name. Here is an example:

```
% File : language.dat
% Purpose : tell iniTeX what files with patterns to load.
english english.hyphenations
=british

dutch hyphen.dutch exceptions.dutch % Nederlands
german hyphen.ger
```

As the file switch.def needs to be read only once, we check whether it was read before. If it was, the command \iflanguage is already defined, so we can stop processing.

```
12.31 \ \langle *kernel \rangle \\ 12.32 \ \langle *!patterns \rangle \\ 12.33 \ \langle *pandafter \rangle \\ 12.34 \ \langle *pandafter \rangle \\ 12.35 \ \langle fi \\ 12.36 \ \langle /!patterns \rangle \\
```

\language Plain TEX version 3.0 provides the primitive \language that is used to store the current language. When used with a pre-3.0 version this function has to be implemented by allocating a counter.

```
12.37 \ifx\language\@undefined  
12.38 \csname newcount\endcsname\language  
12.39 \fi
```

\last@language Another counter is used to store the last language defined. For pre-3.0 formats an extra counter has to be allocated,

```
12.40 \ifx\newlanguage\@undefined
12.41 \csname newcount\endcsname\last@language
plain TEX version 3.0 uses \count 19 for this purpose.
12.42 \else
12.43 \countdef\last@language=19
12.44 \fi
```

\addlanguage

To add languages to TEX's memory plain TEX version 3.0 supplies \newlanguage, in a pre-3.0 environment a similar macro has to be provided. For both cases a new macro is defined here, because the original \newlanguage was defined to be \outer.

For a format based on plain version 2.x, the definition of \newlanguage can not be copied because \count 19 is used for other purposes in these formats. Therefor \addlanguage is defined using a definition based on the macros used to define \newlanguage in plain TEX version 3.0.

```
12.45 \ifx\newlanguage\@undefined
12.46 \def\addlanguage#1{%
```

```
12.47 \global\advance\last@language \@ne
12.48 \ifnum\last@language<\@cclvi
12.49 \else
12.50 \errmessage{No room for a new \string\language!}%
12.51 \fi
12.52 \global\chardef#1\last@language
12.53 \wlog{\string#1 = \string\language\the\last@language}}
```

For formats based on plain version 3.0 the definition of \newlanguage can be simply copied, removing \outer.

```
12.54 \else  
12.55 \def\addlanguage{\alloc@9\language\chardef\@cclvi}  
12.56 \fi
```

\adddialect The macro \adddialect can be used to add the name of a dialect or variant language, for which an already defined hyphenation table can be used.

```
12.57 \def\adddialect#1#2{%
12.58 \global\chardef#1#2\relax
12.59 \wlog{\string#1 = a dialect from \string\language#2}}
```

\ifflamguage Users might want to test (in a private package for instance) which language is currently active. For this we provide a test macro, \ifflamguage, that has three arguments. It checks whether the first argument is a known language. If so, it compares the first argument with the value of \language. Then, depending on the result of the comparison, it executes either the second or the third argument.

```
12.60 \def\iflanguage#1{%
12.61
       \expandafter\ifx\csname l@#1\endcsname\relax
12.62
         \@nolanerr{#1}%
12.63
       \else
12.64
         \bbl@afterfi{\ifnum\csname l@#1\endcsname=\language
12.65
           \expandafter\@firstoftwo
12.66
         \else
           \expandafter\@secondoftwo
12.67
         fi}%
12.68
12.69
       \fi}
```

\selectlanguage

The macro \selectlanguage checks whether the language is already defined before it performs its actual task, which is to update \language and activate language-specific definitions.

To allow the call of \selectlanguage either with a control sequence name or with a simple string as argument, we have to use a trick to delete the optional escape character.

To convert a control sequence to a string, we use the  $\string$  primitive. Next we have to look at the first character of this string and compare it with the escape character. Because this escape character can be changed by setting the internal integer  $\string$  to a character number, we have to compare this number with the character of the string. To do this we have to use  $T_E X$ 's backquote notation to specify the character as a number.

If the first character of the \string'ed argument is the current escape character, the comparison has stripped this character and the rest in the 'then' part consists of the rest of the control sequence name. Otherwise we know that either

the argument is not a control sequence or \escapechar is set to a value outside of the character range 0-255.

If the user gives an empty argument, we provide a default argument for \string. This argument should expand to nothing.

```
12.70 \edef\selectlanguage{%
12.71
      \noexpand\protect
      \expandafter\noexpand\csname selectlanguage \endcsname
12.72
12.73
```

Because the command \selectlanguage could be used in a moving argument it expands to \protect\selectlanguage<sub>□</sub>. Therefor, we have to make sure that a macro \protect exists. If it doesn't it is \let to \relax.

```
12.74 \ifx\@undefined\protect\let\protect\relax\fi
```

As  $\LaTeX 2.09$  writes to files expanded whereas  $\LaTeX 2_{\varepsilon}$  takes care not to expand the arguments of \write statements we need to be a bit clever about the way we add information to .aux files. Therefor we introduce the macro \xxtring which should expand to the right amount of \string's.

```
12.75 \ifx\documentclass\@undefined
     \def\xstring{\string\string\string}
12.77 \setminus else
12.78 \let\xstring\string
12.79 \fi
```

Since version 3.5 babel writes entries to the auxiliary files in order to typeset table of contents etc. in the correct language environment.

\bbl@pop@language

But when the language change happens inside a group the end of the group doesn't write anything to the auxiliary files. Therefor we need TEX's aftergroup mechanism to help us. The command \aftergroup stores the token immediately following it to be executed when the current group is closed. So we define a temporary control sequence \bbl@pop@language to be executed at the end of the group. It calls \bbl@set@language with the name of the current language as its argument.

\bbl@language@stack

The previous solution works for one level of nesting groups, but as soon as more levels are used it is no longer adequate. For that case we need to keep track of the nested languages using a stack mechanism. This stack is called \bbl@language@stack and initially empty.

```
12.80 \xdef\bbl@language@stack{}
```

When using a stack we need a mechanism to push an element on the stack and to retrieve the information afterwards.

\bbl@push@language

The stack is simply a list of languagenames, separated with a '+' sign; the push \bbl@pop@language function can be simple:

```
12.81 \def\bbl@push@language{%
12.82
     \xdef\bbl@language@stack{\languagename+\bbl@language@stack}%
```

Retrieving information from the stack is a little bit less simple, as we need to remove the element from the stack while storing it in the macro \languagename. For this we first define a helper function.

\bbl@pop@lang This macro stores its first element (which is delimited by the '+'-sign) in \languagename and stores the rest of the string (delimited by '-') in its third argument.

```
12.84 \def\bbl@pop@lang#1+#2-#3{%
12.85 \def\languagename{#1}\xdef#3{#2}%
12.86 }
```

The reason for the somewhat weird arrangement of arguments to the helper function is the fact it is called in the following way:

```
12.87 \def\bbl@pop@language{%
12.88 \expandafter\bbl@pop@lang\bbl@language@stack-\bbl@language@stack
```

This means that before \bbl@pop@lang is executed TeX first expands the stack, stored in \bbl@language@stack. The result of that is that the argument string of \bbl@pop@lang contains one or more language names, each followed by a '+'-sign (zero language names won't occur as this macro will only be called after something has been pushed on the stack) followed by the '-'-sign and finally the reference to the stack.

```
12.89 $$
12.90 \expandafter\bbl@set@language\expandafter{\languagename}%
12.91 }
```

Once the name of the previous language is retrieved from the stack, it is fed to \bbl@set@language to do the actual work of switching everything that needs switching.

```
12.92 \expandafter\def\csname selectlanguage \endcsname#1{%
12.93 \bbl@push@language
12.94 \aftergroup\bbl@pop@language
12.95 \bbl@set@language{#1}}
```

\bbl@set@language The macro \bbl@set@language takes care of switching the language environment and of writing entries on the auxiliary files.

```
12.96 \def\bbl@set@language#1{%
12.97 \edef\languagename{%
12.98 \ifnum\escapechar=\expandafter'\string#1\@empty
12.99 \else \string#1\@empty\fi}%
12.100 \select@language{\languagename}%
```

We also write a command to change the current language in the auxiliary files.

```
12.101 \ifOfilesw

12.102 \protectedOwrite\Oauxout{}{\string\selectOlanguage{\languagename}}%

12.103 \addtocontents{\toc}{\xstring\selectOlanguage{\languagename}}%

12.104 \addtocontents{\lof}{\xstring\selectOlanguage{\languagename}}%

12.105 \addtocontents{\lof}{\xstring\selectOlanguage{\languagename}}%

12.106 \fi}
```

First, check if the user asks for a known language. If so, update the value of language and call \originalTeX to bring TeX in a certain pre-defined state.

```
12.110 \else
12.111 \expandafter\ifx\csname date#1\endcsname\relax
12.112 \@noopterr{#1}%
12.113 \else
12.114 \bbl@patterns{\languagename}%
12.115 \originalTeX
```

The name of the language is stored in the control sequence \languagename. The contents of this control sequence could be tested in the following way:

```
\edef\tmp{\string english}
\ifx\languagename\tmp
...
\else
...
\fi
```

The construction with \string is necessary because \languagename returns the name with characters of category code 12 (other). Then we have to redefine \originalTeX to compensate for the things that have been activated. To save memory space for the macro definition of \originalTeX, we construct the control sequence name for the \noextras  $\langle lang \rangle$  command at definition time by expanding the \csname primitive.

```
12.116 \expandafter\def\expandafter\originalTeX

12.117 \expandafter{\csname noextras#1\endcsname

12.118 \left\originalTeX\@empty}%

12.119 \languageshorthands{none}%

12.120 \babel@beginsave
```

Now activate the language-specific definitions. This is done by constructing the names of three macros by concatenating three words with the argument of \selectlanguage, and calling these macros.

```
12.121 \csname captions#1\endcsname
12.122 \csname date#1\endcsname
12.123 \csname extras#1\endcsname\relax
```

The switching of the values of \lefthyphenmin and \righthyphenmin is somewhat different. First we save their current values, then we check if  $\langle lang \rangle$ hyphenmins is defined. If it is not, we set default values (2 and 3), otherwise the values in  $\langle lang \rangle$ hyphenmins will be used.

```
12.124
            \babel@savevariable\lefthyphenmin
12.125
            \babel@savevariable\righthyphenmin
12.126
            \expandafter\ifx\csname #1hyphenmins\endcsname\relax
              \set@hyphenmins\tw@\thr@@\relax
12.127
12.128
12.129
              \expandafter\expandafter\expandafter\set@hyphenmins
12.130
                \csname #1hyphenmins\endcsname\relax
12.131
            \fi
          \fi
12 132
       \fi}
12.133
```

otherlanguage The otherlanguage environment can be used as an alternative to using the \selectlanguage declarative command. When you are typesetting a document

which mixes left-to-right and right-to-left typesetting you have to use this environment in order to let things work as you expect them to.

The first thing this environment does is store the name of the language in \languagename; it then calls \selectlanguage\_\to switch on everything that is needed for this language The \ignorespaces command is necessary to hide the environment when it is entered in horizontal mode.

```
12.134 \long\def\otherlanguage#1{%
12.135 \csname selectlanguage \endcsname{#1}%
12.136 \ignorespaces
12.137 }
```

The \endotherlanguage part of the environment calls \originalTeX to restore (most of) the settings and tries to hide itself when it is called in horizontal mode.

```
12.138 \long\def\endotherlanguage{%
12.139 \originalTeX
12.140 \global\@ignoretrue\ignorespaces
12.141 }
```

otherlanguage\* The otherlanguage environment is meant to be used when a large part of text from a different language needs to be typeset, but without changing the translation of words such as 'figure'.

This environment makes use of \foreign@language.

```
12.142 \expandafter\def\csname otherlanguage*\endcsname#1{% 12.143 \foreign@language{#1}% 12.144 }
```

At the end of the environment we need to switch off the extra definitions. The grouping mechanism of the environment will take care of resetting the correct hyphenation rules.

```
12.145 \expandafter\def\csname endotherlanguage*\endcsname{% 12.146 \csname noextras\languagename\endcsname 12.147 }
```

\foreignlanguage

The \foreignlanguage command is another substitute for the \selectlanguage command. This command takes two arguments, the first argument is the name of the language to use for typesetting the text specified in the second argument.

Unlike \selectlanguage this command doesn't switch everything, it only switches the hyphenation rules and the extra definitions for the language specified. It does this within a group and assumes the \extras $\langle lang \rangle$  command doesn't make any \global changes. The coding is very similar to part of \selectlanguage.

```
12.148 \def\foreignlanguage{\protect\csname foreignlanguage \endcsname}

12.149 \expandafter\def\csname foreignlanguage \endcsname#1#2{%

12.150 \begingroup

12.151 \originalTeX

12.152 \foreign@language{#1}%

12.153 #2%

12.154 \csname noextras#1\endcsname

12.155 \endgroup

12.156 }
```

\foreign@language This macro does the work for \foreignlanguage and the otherlanguage\* environment.

```
12.157 \def\foreign@language#1{%
```

First we need to store the name of the language and check that it is a known language.

```
12.158 \def\languagename{#1}%
12.159 \expandafter\ifx\csname l@#1\endcsname\relax
12.160 \@nolanerr{#1}%
12.161 \else
```

If it is we can select the proper hyphenation table and switch on the extra definitions for this language.

```
12.162 \bbl@patterns{\languagename}%
12.163 \languageshorthands{none}%
```

Then we set the left- and right hyphenmin variables.

```
\csname extras#1\endcsname
12.164
12.165
          \expandafter\ifx\csname #1hyphenmins\endcsname\relax
            \set@hyphenmins\tw@\thr@@\relax
12.166
12.167
12.168
            \expandafter\expandafter\expandafter\set@hyphenmins
12 169
              \csname #1hyphenmins\endcsname\relax
          \fi
12 170
       \fi
12.171
       }
12 172
```

\bbl@patterns This macro selects the hyphenation patterns by changing the \language register. If special hyphenation patterns are available specifically for the current font encoding, use them instead of the default.

```
12.173 \def\bbl@patterns#1{%
12.174 \language=\expandafter\ifx\csname l@#1:\f@encoding\endcsname\relax
12.175 \csname l@#1\endcsname
12.176 \else
12.177 \csname l@#1:\f@encoding\endcsname
12.178 \fi\relax
12.179 }
```

hyphenrules The environment hyphenrules can be used to select *just* the hyphenation rules. This environment does *not* change \languagename and when the hyphenation rules specified were not loaded it has no effect.

```
12.180 \def\hyphenrules#1{%
       \expandafter\ifx\csname 10#1\endcsname\@undefined
12.181
         \0nolanerr{#1}%
12.182
12.183
        \else
          \bbl@patterns{#1}%
12.184
          \languageshorthands{none}%
12.185
             \expandafter\ifx\csname #1hyphenmins\endcsname\relax
12.186
               \set@hyphenmins\tw@\thr@@\relax
12.187
12.188
12.189
               \expandafter\expandafter\set@hyphenmins
12.190
               \csname #1hyphenmins\endcsname\relax
12.191
             \fi
       \fi
12.192
12.193
12.194 \def\endhyphenrules{}
```

\providehyphenmins

The macro \providehyphenmins should be used in the language definition files to provide a default setting for the hyphenation parameters \lefthyphenmin and \righthyphenmin. If the macro \ $\langle lang \rangle$ hyphenmins is already defined this command has no effect.

```
12.195 \def\providehyphenmins#1#2{%

12.196 \expandafter\ifx\csname #1hyphenmins\endcsname\relax

12.197 \Qnamedef{#1hyphenmins}{#2}%

12.198 \fi}
```

\set@hyphenmins This macro sets the values of \lefthyphenmin and \righthyphenmin. It expects two values as its argument.

'LdfInit This macro is defined in two versions. The first version is to be part of the 'kernel' of babel, ie. the part that is loaded in the format; the second version is defined in babel.def. The version in the format just checks the category code of the ampersand and then loads babel.def.

```
12.200 \def\LdfInit{%
12.201 \chardef\atcatcode=\catcode'\@
12.202 \catcode'\@=11\relax
12.203 \input babel.def\relax
```

The category code of the ampersand is restored and the macro calls itself again with the new definition from babel.def

```
12.204 \catcode'\@=\atcatcode \let\atcatcode\relax 12.205 \LdfInit}  
12.206 \langle \text{kernel} \rangle
```

The second version of this macro takes two arguments. The first argument is the name of the language that will be defined in the language definition file; the second argument is either a control sequence or a string from which a control sequence should be constructed. The existence of the control sequence indicates that the file has been processed before.

At the start of processing a language definition file we always check the category code of the ampersand. We make sure that it is a 'letter' during the processing of the file.

```
12.207 (*core)
12.208 \def\LdfInit#1#2{%
12.209 \chardef\atcatcode=\catcode'\@
12.210 \catcode'\@=11\relax
```

Another character that needs to have the correct category code during processing of language definition files is the equals sign, '=', because it is sometimes used in constructions with the \let primitive. Therefor we store its current catcode and restore it later on.

```
12.211 \chardef\eqcatcode=\catcode'\=
12.212 \catcode'\==12\relax
```

Now we check whether we should perhaps stop the processing of this file. To do this we first need to check whether the second argument that is passed to \LdfInit is a control sequence. We do that by looking at the first token after passing #2 through string. When it is equal to \Qbackslashchar we are dealing with a control sequence which we can compare with \Qundefined.

```
12.213 \let\bbl@tempa\relax
12.214 \expandafter\if\expandafter\@backslashchar
12.215 \expandafter\@car\string#2\@nil
12.216 \ifx#2\@undefined
12.217 \else
```

If so, we call \ldfQquit (but after the end of this \if construction) to set the main language, restore the category code of the @-sign and call \endinput.

```
12.218 \def\bbl@tempa{\ldf@quit{#1}}
12.219 \fi
12.220 \else
```

When #2 was not a control sequence we construct one and compare it with \relax.

```
12.221 \expandafter\ifx\csname#2\endcsname\relax
12.222 \else
12.223 \def\bbl@tempa{\ldf@quit{#1}}
12.224 \fi
12.225 \fi
12.226 \bbl@tempa
```

Finally we check \originalTeX.

```
12.227 \ifx\originalTeX\@undefined
12.228 \let\originalTeX\@empty
12.229 \else
12.230 \originalTeX
12.231 \fi}
```

\ldf@quit This macro interrupts the processing of a language definition file.

```
12.232 \def\ldf@quit#1{%

12.233 \expandafter\main@language\expandafter{#1}%

12.234 \catcode'\@=\atcatcode \let\atcatcode\relax

12.235 \catcode'\==\eqcatcode \let\eqcatcode\relax

12.236 \endinput

12.237 }
```

\ldf@finish This macro takes one argument. It is the name of the language that was defined in the language definition file.

We load the local configuration file if one is present, we set the main language (taking into account that the argument might be a control sequence that needs to be expanded) and reset the category code of the @-sign.

```
12.238 \def\ldf@finish#1{%

12.239 \loadlocalcfg{#1}%

12.240 \expandafter\main@language\expandafter{#1}%

12.241 \catcode'\@=\atcatcode \let\atcatcode\relax

12.242 \catcode'\==\eqcatcode \let\eqcatcode\relax

12.243 }
```

After the preamble of the document the commands \LdfInit, \ldfQquit and \ldfQfinish are no longer needed. Therefor they are turned into warning messages in LATEX.

```
\begin{array}{l} 12.244 \verb|\| @onlypreamble \\ 12.245 \verb|\| @onlypreamble \\ 12.246 \verb|\| @onlypreamble \\ 1df@finish \\ \end{array}
```

\main@language \bbl@main@language

This command should be used in the various language definition files. It stores its argument in \bbl@main@language; to be used to switch to the correct language at the beginning of the document.

```
12.247 \def\main@language#1{%

12.248 \def\bbl@main@language{#1}%

12.249 \let\languagename\bbl@main@language

12.250 \bbl@patterns{\languagename}%

12.251 }
```

The default is to use English as the main language.

```
12.252 \ifx\l@english\@undefined
12.253 \let\l@english\z@
12.254 \fi
12.255 \main@language{english}
```

We also have to make sure that some code gets executed at the beginning of the document.

\originalTeX The macro\originalTeX should be known to TeX at this moment. As it has to be expandable we \let it to \@empty instead of \relax.

```
12.259 (*kernel)
12.260 \ifx\originalTeX\@undefined\let\originalTeX\@empty\fi
```

Because this part of the code can be included in a format, we make sure that the macro which initialises the save mechanism, \babel@beginsave, is not considered to be undefined.

```
12.261\ \texttt{\label@beginsave} \\ \texttt{\label@beg
```

\@nolanerr \@nopatterns The babel package will signal an error when a documents tries to select a language that hasn't been defined earlier. When a user selects a language for which no hyphenation patterns were loaded into the format he will be given a warning about that fact. We revert to the patterns for \language=0 in that case. In most formats that will be (US)english, but it might also be empty.

\Onoopterr When the package was loaded without options not everything will work as expected. An error message is issued in that case.

When the format knows about  $\PackageError$  it must be  $\LaTeX Z_{\varepsilon}$ , so we can safely use its error handling interface. Otherwise we'll have to 'keep it simple'.

```
12.262 \ifx\PackageError\@undefined
       \def\@nolanerr#1{%
12.263
          \errhelp{Your command will be ignored, type <return> to proceed}%

When no languages have been loaded yet, the name following the = will be a synonym for hyphenation register 0.

```
\label{localize} $$ \sum_{z,306} \exp \operatorname{def} \csname 10#1\endcsname0\relax 12.307} \w\log \{string \10#1=string \language0\} $$
```

As no hyphenation patterns are read in yet, we can not yet set the hyphenmin parameters. Therefor a commands to do so is stored in a token register and executed when the first pattern file has been processed.

```
12.308 \toks@\expandafter{\the\toks@
```

```
12.309 \expandafter\let\csname #1hyphenmins\expandafter\endcsname
12.310 \csname\languagename hyphenmins\endcsname}%
12.311 \else

Otherwise the name will be a synonym for the language loaded last.

12.312 \expandafter\chardef\csname 10#1\endcsname\last@language
12.313 \wlog{\string\l0#1=\string\language\the\last@language}}

We also need to copy the hyphenmin parameters for the synonym.
```

```
12.314 \expandafter\let\csname #1hyphenmins\expandafter\endcsname
12.315 \csname\languagename hyphenmins\endcsname
12.316 \fi
12.317 }
```

\process@language

The macro \process@language is used to process a non-empty line from the 'configuration file'. It has three arguments, each delimited by white space. The third argument is optional, so a / character is expected to delimit the last argument. The first argument is the 'name' of a language; the second is the name of the file that contains the patterns. The optional third argument is the name of a file containing hyphenation exceptions.

The first thing to do is call \addlanguage to allocate a pattern register and to make that register 'active'.

```
12.318 \def\process@language#1 #2 #3/{%

12.319 \expandafter\addlanguage\csname l@#1\endcsname

12.320 \expandafter\language\csname l@#1\endcsname

12.321 \def\languagename{#1}%
```

Then the 'name' of the language that will be loaded now is added to the token register \toks8. and finally the pattern file is read.

```
12.322 \global\toks8\expandafter{\the\toks8#1, }%
```

For some hyphenation patterns it is needed to load them with a specific font encoding selected. This can be specified in the file language.dat by adding for instance ':T1' to the name of the language. The macro \bbl@get@enc extracts the font encoding from the language name and stores it in \bbl@hyph@enc.

```
12.323 \begingroup
12.324 \bbl@get@enc#1:\@@@
12.325 \ifx\bbl@hyph@enc\@empty
12.326 \else
12.327 \fontencoding{\bbl@hyph@enc}\selectfont
12.328 \fi
```

Some pattern files contain assignments to \lefthyphenmin and \righthyphenmin. TEX does not keep track of these assignments. Therefor we try to detect such assignments and store them in the  $\langle lang \rangle$ hyphenmins macro. When no assignments were made we provide a default setting.

```
12.329 \lefthyphenmin\m@ne
```

Some pattern files contain changes to the \lacksquare en \uccode arrays. Such changes should remain local to the language; therefor we process the pattern file in a group; the \patterns command acts globally so its effect will be remembered.

```
12.330 \input #2\relax
```

Now we globally store the settings of \lefthyphenmin and \righthyphenmin and close the group.

```
12.331 \ifnum\lefthyphenmin=\m@ne
12.332 \else
12.333 \expandafter\xdef\csname #1hyphenmins\endcsname{%}
12.334 \the\lefthyphenmin\the\righthyphenmin}%
12.335 \fi
12.336 \endgroup
```

If the counter \language is still equal to zero we set the hyphenmin parameters to the values for the language loaded on pattern register 0.

```
12.337 \ifnum\the\language=\z@

12.338 \expandafter\ifx\csname #1hyphenmins\endcsname\relax

12.339 \set@hyphenmins\tw@\thr@@\relax

12.340 \else

12.341 \expandafter\expandafter\expandafter\set@hyphenmins

12.342 \csname #1hyphenmins\endcsname

12.343 \fi
```

Now execute the contents of token register zero as it may contain commands which set the hyphenmin parameters for synonyms that were defined before the first pattern file is read in.

```
12.344 \the\toks@
12.345 \fi
```

Empty the token register after use.

```
12.346 \toks@{}%
```

When the hyphenation patterns have been processed we need to see if a file with hyphenation exceptions needs to be read. This is the case when the third argument is not empty and when it does not contain a space token.

```
\def \block \fi
12.347
12.348
          \ifx\bbl@tempa\@empty
12.349
          \else
12.350
            \int fx \block \end{tempa} space
12.351
             \else
               \input #3\relax
12.352
            \backslash fi
12.353
          \backslash fi
12.354
12.355
```

\bbl@get@enc The macro \bbl@get@enc extracts the font encoding from the language name and \bbl@hyph@enc stores it in \bbl@hyph@enc. It uses delimited arguments to achieve this.

```
12.356 \ \texttt{\def} \texttt{\bll@get@enc#1:#2} \texttt{\coloredget@enc#1:#2} \texttt{\coloredget@
```

First store both arguments in temporary macros,

```
12.357 \def\bbl@tempa{#1}%
12.358 \def\bbl@tempb{#2}%
```

then, if the second argument was empty, no font encoding was specified and we're done.

```
12.359 \ifx\bbl@tempb\@empty
12.360 \let\bbl@hyph@enc\@empty
12.361 \else
```

But if the second argument was *not* empty it will now have a superfluous colon attached to it which we need to remove. This done by feeding it to \bbl@get@enc. The string that we are after will then be in the first argument and be stored in \bbl@tempa.

```
12.362 \bbl@get@enc#2\@@@
12.363 \edef\bbl@hyph@enc{\bbl@tempa}%
12.364 \fi}
```

\readconfigfile The configuration file can now be opened for reading.

```
12.365 \openin1 = language.dat
```

See if the file exists, if not, use the default hyphenation file hyphen.tex. The user will be informed about this.

Pattern registers are allocated using count register \last@language. Its initial value is 0. The definition of the macro \newlanguage is such that it first increments the count register and then defines the language. In order to have the first patterns loaded in pattern register number 0 we initialize \last@language with the value -1.

```
12.371 \last@language\m@ne
```

We now read lines from the file until the end is found

```
12.372 \loop
```

While reading from the input, it is useful to switch off recognition of the endof-line character. This saves us stripping off spaces from the contents of the control sequence.

```
12.373 \endlinechar\m@ne
12.374 \read1 to \bbl@line
12.375 \endlinechar'\^^M
Empty lines are skipped.
12.376 \ifx\bbl@line\@empty
12.377 \else
```

Now we add a space and a / character to the end of **\bbl@line**. This is needed to be able to recognize the third, optional, argument of **\process@language** later on.

```
12.378 \edef\bbl@line{\bbl@line\space/}%
12.379 \expandafter\process@line\bbl@line
12.380 \fi
```

Check for the end of the file. To avoid a new if control sequence we create the necessary \iftrue or \iffalse with the help of \csname. But there is one complication with this approach: when skipping the loop...repeat TEX has to read \if/\fi pairs. So we have to insert a 'dummy' \iftrue.

```
12.381 \iftrue \csname fi\endcsname
12.382 \csname if\ifeof1 false\else true\fi\endcsname
12.383 \repeat
```

```
Reactivate the default patterns,

12.384 \language=0

12.385 \fi

and close the configuration file.

12.386 \closein1

Also remove some macros from memory

```

### 12.3 Support for active characters

\bbl@add@special

The macro \bbl@add@special is used to add a new character (or single character control sequence) to the macro \dospecials (and \@sanitize if LATEX is used).

To keep all changes local, we begin a new group. Then we redefine the macros \do and \@makeother to add themselves and the given character without expansion.

```
12.402 \ensuremath{\mbox{$\times$}} 12.403 \ensuremath{\mbox{$\setminus$}} 12.403 \ensuremath{\mbox{$\setminus$}} 12.404 \ensuremath{\mbox{$\setminus$}} 12.405 \ensuremath{\mbox{$\setminus$}
```

To add the character to the macros, we expand the original macros with the additional character inside the redefinition of the macros. Because \@sanitize can be undefined, we put the definition inside a conditional.

```
12.406 \edef\x{\endgroup}
12.407 \def\noexpand\dospecials{\dospecials\do#1}%
12.408 \expandafter\ifx\csname @sanitize\endcsname\relax \else
12.409 \def\noexpand\@sanitize{\@sanitize\@makeother#1}%
12.410 \fi}%
```

The macro \x contains at this moment the following:

 $\endgroup\def\dospecials{old contents \do\langle char\rangle}.$ 

If \@sanitize is defined, it contains an additional definition of this macro. The last thing we have to do, is the expansion of \x. Then \endgroup is executed,

which restores the old meaning of  $\x$ ,  $\do$  and  $\do$ makeother. After the group is closed, the new definition of  $\do$ specials (and  $\do$ sanitize) is assigned.

```
12.411 \x}
```

\bbl@remove@special

The companion of the former macro is \bbl@remove@special. It is used to remove a character from the set macros \dospecials and \@sanitize.

To keep all changes local, we begin a new group. Then we define a help macro  $\xspace \xspace \xspace \xspace$  which expands to empty if the characters match, otherwise it expands to its nonexpandable input. Because  $\xspace \xspace \xsp$ 

```
12.412 \def\bbl@remove@special#1{\begingroup
12.413
         \def\x##1##2{\ifnum'#1='##2\noexpand\empty}
12.414
                       \else\noexpand##1\noexpand##2\fi}%
   With the help of this macro we define \do and \make@other.
          \def\do{\x\do}
12.415
         \def\@makeother{\x\@makeother}%
12.416
   The rest of the work is similar to \bbl@add@special.
         \edef\x{\endgroup
12.417
            \def\noexpand\dospecials{\dospecials}%
12.418
12.419
            \expandafter\ifx\csname @sanitize\endcsname\relax \else
12.420
              \def\noexpand\@sanitize{\@sanitize}%
12 421
            fi}%
12.422
       \x}
```

### 12.4 Shorthands

\initiate@active@char

A language definition file can call this macro to make a character active. This macro takes one argument, the character that is to be made active. When the character was already active this macro does nothing. Otherwise, this macro defines the control sequence  $\normal@char(char)$  to expand to the character in its 'normal state' and it defines the active character to expand to  $\normal@char(char)$  by default  $(\char)$  being the character to be made active). Later its definition can be changed to expand to  $\active@char(char)$  by calling  $\below{below}$ .

For example, to make the double quote character active one could have the following line in a language definition file:

```
\initiate@active@char{"}
```

\bbl@afterelse \bbl@afterfi

Because the code that is used in the handling of active characters may need to look ahead, we take extra care to 'throw' it over the \else and \fi parts of an \if-statement<sup>5</sup>. These macros will break if another \if...\fi statement appears in one of the arguments.

```
12.423 \long\def\bbl@afterelse#1\else#2\fi{fi#1}\\ 12.424 \long\def\bbl@afterfi#1\fi{fi#1}
```

 $<sup>^5</sup>$ This code is based on code presented in TUGboat vol. 12, no2, June 1991 in "An expansion Power Lemma" by Sonja Maus.

To prevent error messages when a shorthand, which normally takes an argument, sees a \par, or }, or similar tokens, we need to be able to 'peek' at what is coming up next in the input stream. Depending on the category code of the token that is seen, we need to either continue the code for the active character, or insert the non-active version of that character in the output. The macro \peek@token therefore takes two arguments, with which it constructs the control sequence to expand next. It \let's \bbl@nexta and \bbl@nextb to the two possible macros. This is necessary for \bbl@test@token to take the right decision.

```
12.425 %\def\peek@token#1#2{%

12.426 % \expandafter\let\expandafter\bbl@nexta\csname #1\string#2\endcsname

12.427 % \expandafter\let\expandafter\bbl@nextb

12.428 % \csname system@active\string#2\endcsname

12.429 % \futurelet\bbl@token\bbl@test@token}
```

\bbl@test@token

When the result of peeking at the next token has yielded a token with category 'letter', 'other' or 'active' it is safe to proceed with evaluating the code for the shorthand. When a token is found with any other category code proceeding is unsafe and therefor the original shorthand character is inserted in the output. The macro that calls \bbl@test@token needs to setup \bbl@nexta and \bbl@nextb in order to achieve this.

```
12 430 %\def\bbl@test@token{%
12.431 % \let\bbl@next\bbl@nexta
         \ifcat\noexpand\bbl@token a%
12.432 %
12 433 %
         \else
12.434 %
           \if cat\noexpand\bbl@token=%
12.435 %
             \if cat\noexpand\bbl@token\noexpand\bbl@next
12.436 %
12.437 %
12.438 %
                \let\bbl@next\bbl@nextb
12.439 %
             \fi
12.440 %
           \fi
12 441 %
        \fi
12.442 % \bbl@next}
```

The macro \initiate@active@char takes all the necessary actions to make its argument a shorthand character. The real work is performed once for each character.

Note that the definition of \@initiate@active@char needs an active character, for this the ~ is used. Some of the changes we need, do not have to become available later on, so we do it inside a group.

```
12.447 \begingroup
12.448 \catcode'\^\active
12.449 \def\x{\endgroup}
12.450 \def\@initiate@active@char##1{%
```

If the character is already active we provide the default expansion under this shorthand mechanism.

```
12.451 \ifcat\noexpand##1\noexpand^\relax
```

```
\@ifundefined{normal@char\string##1}{%
12 452
                \expandafter\let\csname normal@char\string##1\endcsname##1%
12.453
                \expandafter\gdef
12.454
                  \expandafter##1%
12.455
                  \expandafter{%
12.456
                    \expandafter\active@prefix\expandafter##1%
12.457
                    \csname normal@char\string##1\endcsname}}{}%
12.458
            \else
12.459
```

Otherwise we write a message in the transcript file,

```
12.460 \@activated{##1}%
```

and define  $\operatorname{\mathtt{Normal@char}}(\operatorname{char})$  to expand to the character in its default state.

```
12.461 \Qnamedef{normal@char\string##1}{##1}%
```

If we are making the right quote active we need to change \pr@m@s as well.

```
12.462 \ifx##1'%
12.463 \let\prim@s\bbl@prim@s
```

Also, make sure that a single ' in math mode 'does the right thing'.

```
12.464 \Qnamedef{normal@char\string##1}{%

12.465 \textormath{##1}{^\bgroup\prim@s}}%

12.466 \fi
```

If we are using the caret as a shorthand character special care should be taken to make sure math still works. Therefor an extra level of expansion is introduced with a check for math mode on the upper level.

```
\ifx##1^%
12.467
                 \gdef\bbl@act@caret{%
12.468
12.469
                   \ifmmode
12.470
                     \csname normal@char\string^\endcsname
                   \else
12.471
12.472
                     \bbl@afterfi
                     {\if@safe@actives
12.473
12.474
                       \bbl@afterelse\csname normal@char\string##1\endcsname
12.475
12.476
                       \bbl@afterfi\csname user@active\string##1\endcsname
                      fi}%
12.477
12.478
                   \fi}
12.479
               \fi
```

To prevent problems with the loading of other packages after babel we reset the catcode of the character at the end of the package.

```
12.480 \@ifpackagewith{babel}{KeepShorthandsActive}{}{%
12.481 \edef\bbl@tempa{\catcode'\noexpand##1\the\catcode'##1}%
12.482 \expandafter\AtEndOfPackage\expandafter{\bbl@tempa}}%
```

Now we set the lowercase code of the ~ equal to that of the character to be made active and execute the rest of the code inside a \lowercase 'environment'.

```
12.483 \Qtempcnta=\lccode'\~

12.484 \lccode'~='##1%

12.485 \lowercase{%
```

Make the character active and add it to \dospecials and \@sanitize.

```
12.486 \catcode'~\active
12.487 \expandafter\bbl@add@special
12.488 \csname \string##1\endcsname
```

Also re-activate it again at \begin{document}.

```
12.489 \AtBeginDocument{\%}
12.490 \catcode '\#1\active
```

We also need to make sure that the shorthands are active during the processing of the .aux file. Otherwise some citations may give unexpected results in the printout when a shorthand was used in the optional argument of \bibitem for example.

```
12.491 \if@filesw
12.492 \immediate\write\@mainaux{%
12.493 \string\catcode'##1\string\active}%
12.494 \fi}%
```

Define the character to expand to

```
\c char \c c
```

(where  $\active@char(char)$  is one control sequence!).

```
12.495 \expandafter\gdef

12.496 \expandafter\%

12.497 \expandafter\%

12.498 \expandafter\active@prefix\expandafter##1%

12.499 \csname normal@char\string##1\endcsname}}%

12.500 \lccode'\~\@tempcnta
```

For the active caret we first expand to \bbl@act@caret in order to be able to handle math mode correctly.

```
12.502 \ifx##1^\% 
12.503 \@namedef{active@char\string##1}{\bbl@act@caret}\% 
12.504 \else
```

We define the first level expansion of  $\active@char\langle char\rangle$  to check the status of the <code>@safe@actives</code> flag. If it is set to true we expand to the 'normal' version of this character, otherwise we call  $\active@char\langle char\rangle$ .

```
12.505 \Qnamedef{activeQchar\string##1}{%}
12.506 \ifQsafeQactives

12.571
12.572
```

When a shorthand combination such as '' ends up in a heading TEX would see \protect'\protect'. To prevent this from happening a shorthand needs to be defined at user level.

```
12.573 \Qnamedef{user@shQ\string##1Q\string\protectQ}{%

12.574 \csname user@active\string##1\endcsname}%

12.575 }%

12.576 }\x
```

\bbl@sh@select

This command helps the shorthand supporting macros to select how to proceed. Note that this macro needs to be expandable as do all the shorthand macros in order for them to work in expansion-only environments such as the argument of hyphenation.

This macro expects the name of a group of shorthands in its first argument and a shorthand character in its second argument. It will expand to either \bbl@srdcs or \bbl@scndcs. Hence two more arguments need to follow it.

```
12.577 \def\bbl@sh@select#1#2{%
12.578 \expandafter\ifx\csname#1@sh@\string#2@sel\endcsname\relax
12.579 \bbl@afterelse\bbl@scndcs
12.580 \else
12.581 \bbl@afterfi\csname#1@sh@\string#2@sel\endcsname
12.582 \fi
12.583 }
```

\active@prefix The command \active@prefix which is used in the expansion of active character ters has a function similar to \OT1-cmd in that it \protects the active character whenever \protect is not \Otypeset@protect.

```
12.584 \def\active@prefix#1{%
12.585 \ifx\protect\@typeset@protect
12.586 \else
```

When \protect is set to \@unexpandable@protect we make sure that the active character is als *not* expanded by inserting \noexpand in front of it. The \@gobble is needed to remove a token such as \activechar: (when the double colon was the active character to be dealt with).

```
12.587 \ifx\protect\@unexpandable@protect
12.588 \bbl@afterelse\bbl@afterfi\noexpand#1\@gobble
12.589 \else
```

```
\bbl@afterfi\bbl@afterfi\protect#1\@gobble
12 590
          \fi
12.591
12.592
       \fi}
```

\if@safe@actives In some circumstances it is necessary to be able to change the expansion of an active character on the fly. For this purpose the switch @safe@actives is available. The setting of this switch should be checked in the first level expansion of  $\active@char\langle char\rangle$ .

```
12.593 \newif\if@safe@actives
12.594 \@safe@activesfalse
```

\bbl@restore@actives When the output routine kicks in while the active characters were made "safe" this must be undone in the headers to prevent unexpected typeset results. For this situation we define a command to make them "unsafe" again.

```
12.595 \def\bbl@restore@actives{\if@safe@actives\@safe@activesfalse\fi}
```

This macro takes one argument, like \initiate@active@char. The macro is used \bbl@activate to change the definition of an active character to expand to  $\active@char\langle char\rangle$ instead of  $\normal@char(char)$ .

```
12.596 \def\bbl@activate#1{%
12.597
       \expandafter\def
12.598
       \expandafter#1\expandafter{%
          \expandafter\active@prefix
12.599
12.600
          \expandafter#1\csname active@char\string#1\endcsname}%
12.601 }
```

This macro takes one argument, like \bbl@activate. The macro doesn't \bbl@deactivate really make a character non-active; it changes its definition to expand to \normal@char $\langle char \rangle$ .

```
12.602 \def\bbl@deactivate#1{%
       \expandafter\def
12 603
12 604
       \expandafter#1\expandafter{%
          \expandafter\active@prefix
12 605
          \expandafter#1\csname normal@char\string#1\endcsname}%
12 606
12.607 }
```

\bbl@firstcs These macros have two arguments. They use one of their arguments to build a \bbl@scndcs control sequence from.

```
12.608 \def\bbl@firstcs#1#2{\csname#1\endcsname}
12.609 \det bl@scndcs#1#2{\csname#2\endcsname}
```

\declare@shorthand The command \declare@shorthand is used to declare a shorthand on a certain level. It takes three arguments:

- 1. a name for the collection of shorthands, i.e. 'system', or 'dutch';
- 2. the character (sequence) that makes up the shorthand, i.e. ~ or "a;
- 3. the code to be executed when the shorthand is encountered.

```
12.610 \det \det 4142{\clare@shorthand#1#2{\clare@short{#1}#2\clare@short}}
12.611 \def\@decl@short#1#2#3\@nil#4{%
12.612 \ \def\bl@tempa{#3}%
```

```
\ifx\bbl@tempa\@empty
12 613
          \expandafter\let\csname #10sh0\string#20sel\endcsname\bbl0scndcs
12.614
          \@namedef{#1@sh@\string#2@}{#4}%
12.615
12.616
          \expandafter\let\csname #1@sh@\string#2@sel\endcsname\bbl@firstcs
12.617
          \ensuremath{\mbox{\tt 0namedef{\#10sh0\string\#20\string\#30}{\#4}}\
12.618
12.619
        \{fi\}
```

\textormath Some of the shorthands that will be declared by the language definition files have to be usable in both text and mathmode. To achieve this the helper macro \textormath is provided.

```
12.620 \det \text{textormath} #1#2{\%}
12.621
        \ifmmode
           \bbl@afterelse#2%
12.622
12 623
        \else
           \bbl@afterfi#1%
12.624
12.625
        \fi}
```

\language@group \system@group

\user@group The current concept of 'shorthands' supports three levels or groups of shorthands. For each level the name of the level or group is stored in a macro. The default is to have a user group; use language group 'english' and have a system group called 'system'.

```
12.626 \def\user@group{user}
12.627 \def\language@group{english}
12.628 \def\system@group{system}
```

This is the user level command to tell LATEX that user level shorthands will be used \useshorthands in the document. It takes one argument, the character that starts a shorthand.

```
12.629 \det \useshorthands#1{\%}
```

First note that this is user level.

```
\def\user@group{user}%
```

Then initialize the character for use as a shorthand character.

```
\initiate@active@char{#1}%
```

Now that TFX has seen the character its category code is fixed, but for the actions of \bbl@activate to succeed we need it to be active. Hence the trick with the \lccode to circumvent this.

```
12 632
       \@tempcnta\lccode'\~
12.633
       \lccode'~='#1%
        \lowercase{\catcode'~\active\bbl@activate{~}}%
12.634
       \lccode'\~\@tempcnta}
```

\defineshorthand Currently we only support one group of user level shorthands, called 'user'.

```
12.636 \def\defineshorthand{\declare@shorthand{user}}
```

\languageshorthands A user level command to change the language from which shorthands are used.

```
12.637 \det \lceil 1anguage shorthands #1{\det \lceil 1anguage@group{#1}} \rceil
```

\aliasshorthand

12.638 \def\aliasshorthand#1#2{%

First the new shorthand needs to be initialized,

```
12.639 \expandafter\ifx\csname active@char\string#2\endcsname\relax
12.640 \ifx\document\@notprerr
12.641 \@notshorthand{#2}
12.642 \else
12.643 \initiate@active@char{#2}%
```

Then we need to use the \lccode trick to make the new shorthand behave like the old one. Therefore we save the current \lccode of the ~-character and restore it later. Then we \let the new shorthand character be equal to the original.

```
12.644 \@tempcnta\lccode'\~
12.645 \lccode'~='#2%
12.646 \lowercase{\let~#1}%
12.647 \lccode'\~\@tempcnta
12.648 \fi
12.649 \fi
12.650 }
```

#### \@notshorthand

```
12.651 \def\Cnotshorthand#1{%

12.652 \PackageError{babel}{%

12.653 The character '\string #1' should be made

12.654 a shorthand character;\MessageBreak

12.655 add the command \string\useshorthands\string{#1\string} to

12.656 the preamble.\MessageBreak

12.657 I will ignore your instruction}{}%

12.658 }
```

\shorthandon The first level definition of these macros just passes the argument on to \shorthandoff \bbl@switch@sh, adding \@nil at the end to denote the end of the list of characters

```
\label{localization} $$12.659 \newcommand*\shorthandon[1]{\bbl@switch@sh{on}#1\@nil} $$12.660 \newcommand*\shorthandoff[1]{\bbl@switch@sh{off}#1\@nil} $$
```

\bbl@switch@sh The macro \bbl@switch@sh takes the list of characters apart one by one and subsequently switches the category code of the shorthand character according to the first argument of \bbl@switch@sh.

```
12.661 \def\bbl@switch@sh#1#2#3\@nil{%
```

But before any of this switching takes place we make sure that the character we are dealing with is known as a shorthand character. If it is, a macro such as \active@char" should exist.

```
12.662 \Qifundefined{active@char\string#2}{%
12.663 \PackageError{babel}{%
12.664 The character '\string #2' is not a shorthand character
12.665 in \languagename}{%
12.666 Maybe you made a typing mistake?\MessageBreak
12.667 I will ignore your instruction}}{%
12.668 \csic csname bbl@switch@sh@#1\endcsname#2}%
```

Now that, as the first character in the list has been taken care of, we pass the rest of the list back to \bbloswitchOsh.

```
12.669 \ifx#3\@empty\else
12.670 \bbl@afterfi\bbl@switch@sh{#1}#3\@nil
12.671 \fi}
```

\bbl@switch@sh@off All that is left to do is define the actual switching macros. Switching off is easy, we just set the category code to 'other' (12).

```
12.672 \det bbl@switch@sh@off#1{\catcode'#112\relax}
```

\bbl@switch@sh@on

But switching the shorthand character back on is a bit more tricky. It involves making sure that we have an active character to begin with when the macro is being defined. It also needs the use of \lowercase and \locale trickery to get everything to work out as expected. And to keep things local that need to remain local a group is opened, which is closed as soon as \x gets executed.

```
12.673 \begingroup
        \colored{\circ}
12.674
12.675
        \def\x{\endgroup
          \def\bbl@switch@sh@on##1{%
12.676
12.677
             \begingroup
            \lccode '~='#1%
12.678
             \lowercase{\endgroup
12 679
               \catcode '~\active
12.680
               }%
12.681
            }%
12.682
          }
12.683
```

The next operation makes the above definition effective.

```
12.684 \x
12.685 %
```

To prevent problems with constructs such as \char"01A when the double quote is made active, we define a shorthand on system level.

When the right quote is made active we need to take care of handling it correctly in mathmode. Therefore we define a shorthand at system level to make it expand to a non-active right quote in textmode, but expand to its original definition in mathmode. (Note that the right quote is 'active' in mathmode because of its mathcode.)

```
12.687 \declare@shorthand{system}{'}{%
12.688 \textormath{\csname normal@char\string'\endcsname}%
12.689 \{\sp\bgroup\prim@s}}
```

When the left quote is made active we need to take care of handling it correctly when it is followed by for instance an open brace token. Therefore we define a shorthand at system level to make it expand to a non-active left quote.

```
12.690 \label{lem:condition} $$12.690 \end{condition} \label{lem:condition} $$12.690 \end{condition} $$12.690 \end{cond
```

\bbl@prim@s \bbl@pr@m@s One of the internal macros that are involved in substituting \prime for each right quote in mathmode is \primes. This checks if the next character is a right quote. When the right quote is active, the definition of this macro needs to be adapted to look for an active right quote.

```
12.691 \def\bbl@prim@s{%
12.692 \prime\futurelet\@let@token\bbl@pr@m@s}
12.693 \begingroup
12.694 \catcode'\'\active\let'\relax
12.695 \def\x{\endgroup}
12.696 \def\bbl@pr@m@s{%
```

```
\ifx'\@let@token
12 697
12.698
               \expandafter\pr@@@s
             \else
12.699
               \ifx^\@let@token
12.700
                  \expandafter\expandafter\expandafter\pr@@@t
12.701
12.702
12.703
                 \egroup
               \fi
12.705
             fi}%
          }
12.706
12.707 \x
12.708 (/core | shorthands)
```

Normally the ~ is active and expands to \penalty\@M\u. When it is written to the .aux file it is written expanded. To prevent that and to be able to use the character ~ as a start character for a shorthand, it is redefined here as a one

character shorthand on system level.

```
12.709 \*core\
12.710 \initiate@active@char{~}
12.711 \declare@shorthand{system}{~}{\leavevmode\nobreak\}
12.712 \bbl@activate{~}
```

\OT1dqpos The position of the double quote character is different for the OT1 and T1 encodings. It will later be selected using the \functioneding macro. Therefor we define two macros here to store the position of the character in these encodings.

```
12.713 \verb| expandafter\def\csname OT1dqpos\endcsname{127} \\ 12.714 \verb| expandafter\def\csname T1dqpos\endcsname{4}
```

When the macro  $\footnote{Tex}$  we define it here to expand to OT1

```
12.715 \ifx\f@encoding\@undefined
12.716 \def\f@encoding{0T1}
12.717 \fi
```

## 12.5 Language attributes

Language attributes provide a means to give the user control over which features of the language definition files he wants to enable.

\languageattribute

The macro \languageattribute checks whether its arguments are valid and then activates the selected language attribute.

```
12.718 \verb|\newcommand|\languageattribute[2]{||}
```

First check whether the language is known.

```
12.719 \expandafter\ifx\csname l@#1\endcsname\relax 12.720 \Qnolanerr{#1}\% 12.721 \else
```

Than process each attribute in the list.

```
12.722 \@for\bbl@attr:=#2\do{%
```

We want to make sure that each attribute is selected only once; therefor we store the already selected attributes in \bbl@known@attribs. When that control sequence is not yet defined this attribute is certainly not selected before.

```
12.723 \ifx\bbl@known@attribs\@undefined
12.724 \in@false
12.725 \else
```

Now we need to see if the attribute occurs in the list of already selected attributes.

```
12.726 \edef\bbl@tempa{\noexpand\in@{,#1-\bbl@attr,}%
12.727 {,\bbl@known@attribs,}}%
12.728 \bbl@tempa
12.729 \fi
```

When the attribute was in the list we issue a warning; this might not be the users intention.

```
12.730 \ifin@
12.731 \PackageWarning{Babel}{%
12.732 You have more than once selected the attribute
12.733 '\bbl@attr'\MessageBreak for language #1}%
12.734 \else
```

When we end up here the attribute is not selected before. So, we add it to the list of selected attributes and execute the associated T<sub>F</sub>X-code.

```
\edef\bbl@tempa{%
12.735
             12.736
           \bbl@tempa
12.737
           \edef\bbl@tempa{#1-\bbl@attr}%
12.738
           \expandafter\bbl@ifknown@ttrib\expandafter{\bbl@tempa}\bbl@attributes%
12.739
12.740
           {\csname#1@attr@\bbl@attr\endcsname}%
12.741
           {\@attrerr{#1}{\bbl@attr}}%
        \fi
12.742
12.743
         }
      fi
12.744
```

This command should only be used in the preamble of a document.

12.745 \@onlypreamble\languageattribute

The error text to be issued when an unknown attribute is selected.

```
12.746 \newcommand*{\Cattrerr}[2]{%
12.747 \PackageError{babel}%
12.748 \The attribute #2 is unknown for language #1.}%
12.749 \{Your command will be ignored, type <return> to proceed}}
```

\bbl@declare@ttribute This command adds the new language/attribute combination to the list of known attributes.

```
12.750 \def\bbl@declare@ttribute#1#2#3{%
12.751 \bbl@add@list\bbl@attributes{#1-#2}%
```

Then it defines a control sequence to be executed when the attribute is used in a document. The result of this should be that the macro \extras... for the current language is extended, otherwise the attribute will not work as its code is removed from memory at \begin{document}.

```
12.752 \expandafter\def\csname#1@attr@#2\endcsname{#3}% 12.753 }
```

 $\verb|\bbl@ifattributeset| \\$ 

This internal macro has 4 arguments. It can be used to interpret TEX code based on whether a certain attribute was set. This command should appear inside the argument to \AtBeginDocument because the attributes are set in the document preamble, after babel is loaded.

The first argument is the language, the second argument the attribute being checked, and the third and fourth arguments are the true and false clauses.

```
12.754 \def\bl@ifattributeset#1#2#3#4{\%}
```

First we need to find out if any attributes were set; if not we're done.

```
12.755 \ifx\bbl@known@attribs\@undefined
12.756 \in@false
12.757 \else
```

The we need to check the list of known attributes.

```
12.758 \edef\bbl@tempa{\noexpand\in@{,#1-#2,}%

12.759 {,\bbl@known@attribs,}}%

12.760 \bbl@tempa

12.761 \fi
```

When we're this far \ifin@ has a value indicating if the attribute in question was set or not. Just to be safe the code to be executed is 'thrown over the \fi'.

```
12.762 \ifin@

12.763 \bbl@afterelse#3%

12.764 \else

12.765 \bbl@afterfi#4%

12.766 \fi

12.767 }
```

\bbl@add@list This internal macro adds its second argument to a comma separated list in its first argument. When the list is not defined yet (or empty), it will be initiated

```
12.768 \def\bbl@add@list#1#2{%
        \ifx#1\@undefined
12.769
          \def#1{#2}%
12.770
12.771
        \else
          \ifx#1\@empty
12.772
             \def#1{#2}%
12.773
           \else
12.774
             \edef#1{#1,#2}%
12.775
          \fi
12.776
        \fi
12.777
        }
12.778
```

\bbl@ifknown@ttrib An internal macro to check whether a given language/attribute is known. The macro takes 4 arguments, the language/attribute, the attribute list, the TEX-code to be executed when the attribute is known and the TEX-code to be executed otherwise.

```
12.779 \def\bbl@ifknown@ttrib#1#2{%
```

We first assume the attribute is unknown.

```
12.780 \let\bbl@tempa\@secondoftwo
```

Then we loop over the list of known attributes, trying to find a match.

When a match is found the definition of \bbl@tempa is changed.

```
12.784 \let\bbl@tempa\@firstoftwo
12.785 \else
12.786 \fi}%
```

```
Finally we execute \bbl@tempa.
                12.787
                       \bbl@tempa
                12.788 }
\bbl@clear@ttribs This macro removes all the attribute code from IATFX's memory at \begin{document}
                    time (if any is present).
                12.789 \def\bbl@clear@ttribs{%
                       \ifx\bbl@attributes\@undefined\else
                          \@for\bbl@tempa:=\bbl@attributes\do{%
                12.791

```

### 12.6 Support for saving macro definitions

To save the meaning of control sequences using \babel@save, we use temporary control sequences. To save hash table entries for these control sequences, we don't use the name of the control sequence to be saved to construct the temporary name. Instead we simply use the value of a counter, which is reset to zero each time we begin to save new values. This works well because we release the saved meanings before we begin to save a new set of control sequence meanings (see \selectlanguage and \originalTeX).

\babel@savecnt The initialization of a new save cycle: reset the counter to zero. \babel@beginsave\2.800 \def\babel@beginsave\\babel@savecnt\z@}

Before it's forgotten, allocate the counter and initialize all.

```
12.801 \newcount\babel@savecnt
12.802 \babel@beginsave
```

The macro \babel@save\(csname\) saves the current meaning of the control sequence \(\lambda csname\rangle\) to \originalTeX<sup>6</sup>. To do this, we let the current meaning to a temporary control sequence, the restore commands are appended to \originalTeX and the counter is incremented.

```
12.803 \det \text{babel@save#1{%}}
        \expandafter\let\csname babel@\number\babel@savecnt\endcsname #1\relax
12.804
12.805
        \begingroup
          \toks@\expandafter{\originalTeX \let#1=}%
12.806
          \edef\x{\endgroup
12.807
            \def\noexpand\originalTeX{\the\toks@ \expandafter\noexpand
12.808
               \csname babel@\number\babel@savecnt\endcsname\relax}}%
12.809
12.810
        \advance\babel@savecnt\@ne}
12.811
```

\babel@savevariable The macro \babel@savevariable $\langle variable \rangle$  saves the value of the variable.  $\langle variable \rangle$  can be anything allowed after the \the primitive.

<sup>6\</sup>originalTeX has to be expandable, i. e. you shouldn't let it to \relax.

```
12.812 \def\babel@savevariable#1{\begingroup
         \toks@\expandafter{\originalTeX #1=}%
12.813
          \edef\x{\endgroup
12.814
12.815
            \def\noexpand\originalTeX{\the\toks@ \the#1\relax}}%
12.816
```

\bbl@nonfrenchspacing

\bbl@frenchspacing Some languages need to have \frenchspacing in effect. Others don't want that. The command \bbl@frenchspacing switches it on when it isn't already in effect and \bbl@nonfrenchspacing switches it off if necessary.

```
12.817 \def\bbl@frenchspacing{%
12.818
        \ifnum\the\sfcode '\. =\@m
12.819
          \let\bbl@nonfrenchspacing\relax
12.820
        \else
12.821
          \frenchspacing
          \let\bbl@nonfrenchspacing\nonfrenchspacing
12.822
       \fi}
12.823
12.824 \let\bbl@nonfrenchspacing\nonfrenchspacing
```

#### Support for extending macros 12.7

For each language four control sequences have to be defined that control the language-specific definitions. To be able to add something to these macro once they have been defined the macro \addto is introduced. It takes two arguments, a  $\langle control\ sequence \rangle$  and TeX-code to be added to the  $\langle control\ sequence \rangle$ .

If the  $\langle control \ sequence \rangle$  has not been defined before it is defined now.

```
12.825 \def\addto#1#2{%
12.826
        \ifx#1\@undefined
          \def#1{#2}%
12.827
        \else
12.828
```

The control sequence could also expand to \relax, in which case a circular definition results. The net result is a stack overflow.

```
12.829
           \ifx#1\relax
12.830
             \def#1{#2}%
12.831
```

Otherwise the replacement text for the  $\langle control\ sequence \rangle$  is expanded and stored in a token register, together with the T<sub>E</sub>X-code to be added. Finally the (control sequence is redefined, using the contents of the token register.

```
12.832
          {\toks@\expandafter{#1#2}%
12.833
           12.834
        \fi
12.835
      \fi
12.836 }
```

#### 12.8 Macros common to a number of languages

This macro makes hyphenation possible. Basically its definition is nothing more than \nobreak \hskip Opt plus Opt<sup>7</sup>.

```
12.837 \def\bbl@t@one{T1}
```

 $<sup>^7\</sup>mathrm{T_EX}$  begins and ends a word for hyphenation at a glue node. The penalty prevents a linebreak at this glue node.

```
\label{lowhyphens} $$12.838 \def\allowhyphens{% } $$12.839 \ifx\cf@encoding\bl@t@one\else\bbl@allowhyphens{fi} $$12.840 \def\bbl@allowhyphens{\nobreak\hskip\z@skip}$
```

\set@low@box The following macro is used to lower quotes to the same level as the comma. It prepares its argument in box register 0.

```
\label{lower} $12.841 \def\set@low@box#1{\setbox\tw@\hbox{,}\setbox\z@\hbox{#1}% $$12.842 \dimen\z@ \advance\dimen\z@ -\ht\tw@% $$12.843 \setbox\z@\hbox{\lower\dimen\z@ \box\z@\ht\z@\ht\tw@ \dp\z@\dp\tw@}$$
```

\save@sf@q The macro \save@sf@q is used to save and reset the current space factor.

```
12.844 \def\save@sf@q #1{\leavevmode

12.845 \begingroup

12.846 \edef\@SF{\spacefactor \the\spacefactor}#1\@SF

12.847 \endgroup

12.848 }
```

\bbl@disc For some languages the macro \bbl@disc is used to ease the insertion of discretionaries for letters that behave 'abnormally' at a breakpoint.

```
12.849 \def\bbl@disc#1#2{%
12.850 \nobreak\discretionary{#2-}{}{#1}\allowhyphens}
```

## 12.9 Making glyphs available

The file babel.dtx<sup>8</sup> makes a number of glyphs available that either do not exist in the OT1 encoding and have to be 'faked', or that are not accessible through Tienc.def.

### 12.10 Quotation marks

 $\quotedblbase$ 

In the T1 encoding the opening double quote at the baseline is available as a separate character, accessible via \quotedblbase. In the OT1 encoding it is not available, therefor we make it available by lowering the normal open quote character to the baseline.

```
12.851 \ProvideTextCommand{\quotedblbase}{\mathrm{0T1}{\%} \\
12.852 \save@sf@q{\set@low@box{\textquotedblright\/}\% \\
12.853 \box\z@\kern-.04em\allowhyphens}}
```

Make sure that when an encoding other than 0T1 or T1 is used this glyph can still be typeset.

```
12.854 \ProvideTextCommandDefault{\quotedblbase}{% 12.855 \UseTextSymbol{OT1}{\quotedblbase}}
```

\quotesinglbase We also need the single quote character at the baseline.

 $<sup>^8{\</sup>rm The}$  file described in this section has version number v3.8l, and was last revised on 2008/03/16.

```
Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.
```

```
12.859 \ProvideTextCommandDefault{\quotesinglbase}{% 12.860 \UseTextSymbol{OT1}{\quotesinglbase}}
```

```
\ifmmode
12.862
12.863
         \11
12.864
      \else
         \save@sf@q{\nobreak
12.865
           \label{lowhyphens} $$ \vec{s} : 2ex \cdot (s) = 11
12.866
       \fi}
12.867
12.868 \ProvideTextCommand{\guillemotright}{OT1}{%
      \ifmmode
12.869
12.870
         \gg
12.871
       \else
12.872
         \save@sf@q{\nobreak
            \raise.2ex\hbox{$\scriptscriptstyle\gg$}\allowhyphens}%
12.873
12.874
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
12.875 \ProvideTextCommandDefault{\guillemotleft}{\% 12.876 \UseTextSymbol{OT1}{\guillemotleft}} 12.877 \ProvideTextCommandDefault{\guillemotright}{\% 12.878 \UseTextSymbol{OT1}{\guillemotright}}
```

\guilsinglleft The single guillemets are not available in OT1 encoding. They are faked. \guilsinglright{2.879}\ProvideTextCommand{\guilsinglleft}{OT1}{%

```
\ifmmode
12.880
12.881
          <%
12.882
        \else
          \save@sf@q{\nobreak
12.883
            \raise.2ex\hbox{$\scriptscriptstyle<$}\allowhyphens}%
12.884
12.885
12.886 \ProvideTextCommand{\guilsinglright}{OT1}{%
12.887
       \ifmmode
         >%
12.888
        \else
12.889
          \save@sf@q{\nobreak
12.890
            \raise.2ex\hbox{$\scriptscriptstyle>$}\allowhyphens}%
12.891
12.892
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
12.893 \ProvideTextCommandDefault{\guilsinglleft}{%
12.894 \UseTextSymbo1{0T1}{\guilsinglleft}}
12.895 \ProvideTextCommandDefault{\guilsinglright}{%
12.896 \UseTextSymbo1{0T1}{\guilsinglright}}
```

### 12.11 Letters

\ij The dutch language uses the letter 'ij'. It is available in T1 encoded fonts, but not \IJ in the OT1 encoded fonts. Therefor we fake it for the OT1 encoding.

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
12.903 \ProvideTextCommandDefault{\ij}{%
12.904 \UseTextSymbol{0T1}{\ij}}
12.905 \ProvideTextCommandDefault{\IJ}{%
12.906 \UseTextSymbol{0T1}{\IJ}}
```

\dj The croatian language needs the letters \dj and \DJ; they are available in the T1 \DJ encoding, but not in the OT1 encoding by default.

Some code to construct these glyphs for the OT1 encoding was made available to me by Stipcevic Mario, (stipcevic@olimp.irb.hr).

```
12.907 \def\crrtic@{\hrule height0.1ex width0.3em}
12.908 \def\crttic@{\hrule height0.1ex width0.33em}
12.909 %
12.910 \def\ddj@{%
       \setbox0\hbox{d}\dimen@=\ht0
12.911
       \advance\dimen@1ex
12.912
12.913
       \dimen@.45\dimen@
       \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
12.914
       \advance\dimen@ii.5ex
12.915
       \leavevmode\rlap{\raise\dimen@\hbox{\kern\dimen@ii\vbox{\crrtic@}}}}
12.916
12.917 \def\DDJ@{%
12.918 \setbox0\hbox{D}\dimen@=.55\ht0
       \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
12.919
      \advance\dimen@ii.15ex %
12.920
                                             correction for the dash position
       \advance\dimen@ii-.15\fontdimen7\font %
                                                       correction for cmtt font
12.922 \qquad \texttt{\dimen\thr@@\expandafter\rem@pt\the\fontdimen7\font\dimen@pt\the\fontdimen0} \\
12.923
       \leavevmode\rlap{\raise\dimen@\hbox{\kern\dimen@ii\vbox{\crttic@}}}}
12.924 %
12.925 \DeclareTextCommand{\dj}{OT1}{\ddj@ d}
12.926 \DeclareTextCommand{\DJ}{OT1}{\DDJ@ D}
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

\SS For the T1 encoding \SS is defined and selects a specific glyph from the font, but for other encodings it is not available. Therefor we make it available here.

```
12.931 \DeclareTextCommand{\SS}{\OT1}{\SS} 
12.932 \ProvideTextCommandDefault{\SS}{\UseTextSymbol{\OT1}{\SS}}
```

### 12.12 Shorthands for quotation marks

Shorthands are provided for a number of different quotation marks, which make them usable both outside and inside mathmode.

```
\glq The 'german' single quotes.
 \gr_{2.933}\ProvideTextCommand{\glq}{0T1}{%}
          \textormath{\quotesinglbase}{\mbox{\quotesinglbase}}}
    12.935 \ProvideTextCommand{\glq}{T1}{%
          \textormath{\quotesinglbase}{\mbox{\quotesinglbase}}}
    The definition of \grq depends on the fontencoding. With T1 encoding no extra
       kerning is needed.
    12.938 \ProvideTextCommand{\grq}{T1}{%
          \textormath{\textquoteleft}{\mbox{\textquoteleft}}}
    12.940 \ProvideTextCommand{\grq}{OT1}{%
          \square \save@sf@q{\kern-.0125em%
          \textormath{\textquoteleft}{\mbox{\textquoteleft}}%
          \kern.07em\relax}}
    12.944 \ProvideTextCommandDefault{\grq}{\UseTextSymbol{OT1}\grq}
\glqq The 'german' double quotes.
\grq_{2.945}\ \ProvideTextCommand{\glqq}{0T1}{%
          \textormath{\quotedblbase}{\mbox{\quotedblbase}}}
    12.947 \ProvideTextCommand{\glqq}{T1}{%
          \verb|\textormath{\quotedblbase}{\mbox{\quotedblbase}}| 
    12.949 \label{local_problem} \end{align*} 12.949 \end{align*} ProvideTextCommandDefault{\glqq}{\UseTextSymbol{0T1}\glqq}
       The definition of \grqq depends on the fontencoding. With T1 encoding no extra
       kerning is needed.
    12.950 \ProvideTextCommand{\grqq}{T1}{%
          \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
    12.952 \ProvideTextCommand{\grqq}{OT1}{%
    12.953 \save@sf@q{\kern-.07em%
           \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}%
    12.954
    12.955
           \kern.07em\relax}}
    12.956 \ \ \ ProvideTextCommandDefault{\grqq}{\UseTextSymbol{OT1}\grqq}
\flq The 'french' single guillemets.
frq_{2.957} \ProvideTextCommand{\flq}{0T1}{%
          \textormath{\guilsinglleft}{\mbox{\guilsinglleft}}}
    12.959 \ProvideTextCommand{\flq}{T1}{\%}
          \textormath{\guilsinglleft}{\mbox{\guilsinglleft}}}
    12.962 \ProvideTextCommand{\frq}{0T1}{\%}
          \textormath{\guilsinglright}{\mbox{\guilsinglright}}}
    12.964 \ProvideTextCommand{frq}{T1}{%}
    12.965 \textormath{\guilsinglright}{\mbox{\guilsinglright}}}
    12.966 \ \tt ProvideTextCommandDefault\{\frq\}{\tt UseTextSymbol\{OT1\}\frq}\}
\flqq The 'french' double guillemets.
\frq_{2.967}\ \ProvideTextCommand{\flqq}{0T1}{%
    12.968 \textormath{\guillemotleft}{\mbox{\guillemotleft}}}
```

```
12.969 \ProvideTextCommand{\flqq}{T1}{%
12.970 \textormath{\guillemotleft}}\
12.971 \ProvideTextCommandDefault{\flqq}{\UseTextSymbol{0T1}\flqq}\
12.972 \ProvideTextCommand{\frqq}{0T1}{%
12.973 \textormath{\guillemotright}{\mbox{\guillemotright}}}\
12.974 \ProvideTextCommand{\frqq}{T1}{%
12.975 \textormath{\guillemotright}{\mbox{\guillemotright}}}\
12.976 \ProvideTextCommandDefault{\frqq}{\UseTextSymbol{0T1}\frqq}}
```

### 12.13 Umlauts and trema's

The command \" needs to have a different effect for different languages. For German for instance, the 'umlaut' should be positioned lower than the default position for placing it over the letters a, o, u, A, O and U. When placed over an e, i, E or I it can retain its normal position. For Dutch the same glyph is always placed in the lower position.

\umlauthigh To be able to provide both positions of \" we provide two commands to switch \umlautlow the positioning, the default will be \umlauthigh (the normal positioning).

```
12.977 \def\umlauthigh{%
12.978 \def\bbl@umlauta##1{\leavevmode\bgroup%
12.979 \expandafter\accent\csname\f@encoding dqpos\endcsname
12.980 ##1\allowhyphens\egroup}%
12.981 \let\bbl@umlaute\bbl@umlauta}
12.982 \def\umlautlow{%
12.983 \def\bbl@umlauta{\protect\lower@umlaut}}
12.984 \def\umlautelow{%
12.985 \def\bbl@umlaute{\protect\lower@umlaut}}
12.986 \umlauthigh
```

\lower@umlaut The command \lower@umlaut is used to position the \" closer the the letter.

We want the umlaut character lowered, nearer to the letter. To do this we need an extra  $\langle dimen \rangle$  register.

```
12.987 \expandafter\ifx\csname U@D\endcsname\relax
12.988 \csname newdimen\endcsname\U@D
12.989 \fi
```

The following code fools TEX's make\_accent procedure about the current x-height of the font to force another placement of the umlaut character.

```
12.990 \def\lower@umlaut#1{\%}
```

First we have to save the current x-height of the font, because we'll change this font dimension and this is always done globally.

```
12.991 \leavevmode\bgroup
12.992 \U@D 1ex%
```

Then we compute the new x-height in such a way that the umlaut character is lowered to the base character. The value of .45ex depends on the METAFONT parameters with which the fonts were built. (Just try out, which value will look best.)

```
12.993 {\setbox\z@\hbox{%}

12.994 \expandafter\char\csname\f@encoding dqpos\endcsname}%

12.995 \dimen@ -.45ex\advance\dimen@\ht\z@
```

If the new x-height is too low, it is not changed.

```
12.996 \ifdim 1ex<\dimen@ \fontdimen5\font\dimen@ \fi}%
```

Finally we call the \accent primitive, reset the old x-height and insert the base character in the argument.

```
12.997 \expandafter\accent\csname\f@encoding dqpos\endcsname
12.998 \fontdimen5\font\U@D #1%
12.999 \egroup}
```

For all vowels we declare \" to be a composite command which uses \bbl@umlauta or \bbl@umlaute to position the umlaut character. We need to be sure that these definitions override the ones that are provided when the package fontenc with option OT1 is used. Therefor these declarations are postponed until the beginning of the document.

```
12.1000 \AtBeginDocument{%
   12.1001
   12.1002
   12.1003
   12.1004
   12.1005
   \DeclareTextCompositeCommand{'"}{OT1}{u}{\bbl@umlauta{u}}%
12.1006
   \DeclareTextCompositeCommand{'"}{OT1}{A}{\bbl@umlauta{A}}%
12.1007
   \DeclareTextCompositeCommand{\"}{OT1}{E}{\bbl@umlaute{E}}}%
12.1008
   12.1009
   12.1010
   12.1011
12.1012 }
```

### 12.14 The redefinition of the style commands

The rest of the code in this file can only be processed by LATEX, so we check the current format. If it is plain TEX, processing should stop here. But, because of the need to limit the scope of the definition of \format, a macro that is used locally in the following \if statement, this comparison is done inside a group. To prevent TEX from complaining about an unclosed group, the processing of the command \endinput is deferred until after the group is closed. This is accomplished by the command \aftergroup.

```
12.1013 {\def\format{lplain}
12.1014 \ifx\fmtname\format
12.1015 \else
12.1016 \def\format{LaTeX2e}
12.1017 \ifx\fmtname\format
12.1018 \else
12.1019 \aftergroup\endinput
12.1020 \fi
12.1021 \fi}
```

Now that we're sure that the code is seen by LATEX only, we have to find out what the main (primary) document style is because we want to redefine some macros. This is only necessary for releases of LATEX dated before December 1991. Therefor this part of the code can optionally be included in babel.def by specifying the docstrip option names.

```
12.1022 \langle *names \rangle
```

The standard styles can be distinguished by checking whether some macros are defined. In table 1 an overview is given of the macros that can be used for this purpose.

```
article : both the \chapter and \opening macros are undefined
report and book : the \chapter macro is defined and the \opening is undefined
letter : the \chapter macro is undefined and the \opening is defined
```

Table 1: How to determine the main document style

The macros that have to be redefined for the report and book document styles happen to be the same, so there is no need to distinguish between those two styles.

\doc@style First a parameter \doc@style is defined to identify the current document style. This parameter might have been defined by a document style that already uses macros instead of hard-wired texts, such as artikel1.sty [6], so the existence of \doc@style is checked. If this macro is undefined, i.e., if the document style is unknown and could therefore contain hard-wired texts, \doc@style is defined to the default value '0'.

```
12.1023 \ifx\@undefined\doc@style
12.1024 \def\doc@style{0}%
```

This parameter is defined in the following if construction (see table 1):

```
\ifx\@undefined\opening
12.1025
              \int fx\ensuremath{\mbox{\tt Qundefined}\ensuremath{\mbox{\tt Chapter}}}
12.1026
                 \def \doc@style{1}%
12.1027
12.1028
              \else
12.1029
                 \def \doc@style{2}%
              \fi
12.1030
12.1031

#### 12.14.1 Redefinition of macros

Now here comes the real work: we start to redefine things and replace hard-wired texts by macros. These redefinitions should be carried out conditionally, in case it has already been done.

For the figure and table environments we have in all styles:

```
\label{locality} $$12.1035 \otimes \left(figurename\right)_{\def\fum@figure(figurename)_{\def\fum@table,\def\fum@table,\def}_{\def\fum@table,\def}_{\def\fum@table,\def}_{\def\fum@table,\def\fum@table,\def}_{\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fum@table,\def\fu
```

The rest of the macros have to be treated differently for each style. When \doc@style still has its default value nothing needs to be done.

```
12.1037 \ifcase \doc@style\relax
12.1038 \or
```

This means that babel.def is read after the article style, where no \chapter and \opening commands are defined<sup>9</sup>.

First we have the \tableofcontents, \listoffigures and \listoftables:

```
12.1039 \@ifundefined{contentsname}%
12.1040
                     {\def \table of contents {\section*{\contentsname \contentsname \conte
                                 {\uppercase{\contentsname}}{\uppercase{\contentsname}}}%
12.1041
                         \@starttoc{toc}}}{}
12 1042
12 1043
12.1044 \@ifundefined{listfigurename}%
                    {\def\listoffigures\{\section*{\listfigurename\Qmkboth}}
12.1045
12.1046
                                 {\uppercase{\listfigurename}}}\uppercase{\listfigurename}}}\%
12.1047
                       \@starttoc{lof}}}{}
12.1048
12.1049 \@ifundefined{listtablename}%
12.1050
                     12.1051
                                 {\uppercase {\listtable name}}}{\uppercase {\listtable name}}}
12.1052
                         \@starttoc{lot}}}{}
              Then the \thebibliography and \theindex environments.
12.1053 \@ifundefined{refname}%
                     12.1054
12.1055
                         12.1056
                         \leftmargin\labelwidth
12.1057
                             \advance\leftmargin\labelsep
12.1058
                             \usecounter{enumi}}%
12.1059
12.1060
                             \def\newblock{\hskip.11em\ plus.33em\ minus.07em}%
                             \sloopy\clubpenalty4000\widowpenalty\clubpenalty
12.1061
                            \sfcode'\.=1000\relax}
12 1062
12 1063
12.1064 \Qifundefined{indexname}%
                     \{\def\theindex\{\def\theindex\{\def\theindex\}\def\theindex\}\}
12.1065
12.1066
                       \columnseprule \z0
                       \columnsep 35pt\twocolumn[\section*{\indexname}]%
12.1067
                          12.1068
12.1069
                          \thispagestyle{plain}%
                          12.1070
              The abstract environment:
12.1071 \@ifundefined{abstractname}%
12.1072
                     {\def\abstract{\if@twocolumn}
                     \section*{\abstractname}%
12.1073
12.1074
                     \else \small
12.1075
                     \begin{center}%
12.1076
                     {\bf \abstractname \vspace {-.5em} \vspace {\z@}}%
                     \end{center}%
12.1077
                     \quotation
12 1078
12.1079
                     fi}{}
              And last but not least, the macro \part:
12.1080 \@ifundefined{partname}%
12.1081 {\def\@part[#1] #2{\ifnum \c@secnumdepth >\m@ne
```

<sup>&</sup>lt;sup>9</sup>A fact that was pointed out to me by Nico Poppelier and was already used in Piet van Oostrum's document style option nl.

```
\refstepcounter{part}%
12 1082
                \verb| | add contentsline{toc}{part}{\| the part}|
12.1083
                \hspace{1em}#1}\else
12.1084
             \addcontentsline{toc}{part}{#1}\fi
12.1085
          {\parindent\z@\raggedright
12.1086
           \ifnum \c@secnumdepth >\m@ne
12.1087
             \Large \bf \partname{} \thepart
12.1088
             \par \nobreak
12.1089
12.1090
           \fi
           \huge \bf
12.1091
           #2 \mathbb{}{} 
12.1092
           \nobreak
12 1093
12.1094
           \vskip 3ex\@afterheading}%
12.1095 }{}
```

This is all that needs to be done for the article style.

12.1096 \or

The next case is formed by the two styles book and report. Basically we have to do the same as for the article style, except now we must also change the \chapter command.

The tables of contents, figures and tables:

```
12.1097 \@ifundefined{contentsname}%
12.1098
           {\def\tableofcontents{\@restonecolfalse
12.1099
             \if@twocolumn\@restonecoltrue\onecolumn
             \fi\chapter*{\contentsname\@mkboth
12 1100
                 {\uppercase{\contentsname}}{\uppercase{\contentsname}}}%
12.1101
12.1102
             \@starttoc{toc}%
             \csname if@restonecol\endcsname\twocolumn
12.1103
12.1104
             \csname fi\endcsname}}{}
12.1105
12.1106 \@ifundefined{listfigurename}%
12.1107
           {\def \listoffigures {\derestonecolfalse}}
12.1108
             \if@twocolumn\@restonecoltrue\onecolumn
             fi\chapter*{\listfigurename\c 0mkboth}
12.1109
                  \{\uppercase \{\listfigure name\}\} \{\uppercase \{\listfigure name\}\}\} \% 
12.1110
12.1111
             \@starttoc{lof}%
             \csname if@restonecol\endcsname\twocolumn
12.1112
12.1113
             \csname fi\endcsname}}{}
12.1114
12.1115 \@ifundefined{listtablename}%
           {\def \listoftables \{\def \listoftables \}}
12.1116
             12.1117
12.1118
             fi\chapter*{\listtablename\0mkboth}
12.1119
                 {\uppercase {\listtable name}} {\uppercase {\listtable name}}} % 
             \@starttoc{lot}%
12 1120
             \csname if@restonecol\endcsname\twocolumn
12 1121
             \csname fi\endcsname}}{}
12.1122
```

Again, the bibliography and index environments; notice that in this case we use \bibname instead of \refname as in the definitions for the article style. The reason for this is that in the article document style the term 'References' is used in the definition of \thebibliography. In the report and book document styles the term 'Bibliography' is used.

```
12.1123 \@ifundefined{bibname}%
                         {\def \the bibliography #1{\chapter*{\bibname}}}
12.1124
                           \@mkboth{\uppercase{\bibname}}}\uppercase{\bibname}}}%
12.1125
12.1126
                           12.1127
                           \leftmargin\labelwidth \advance\leftmargin\labelsep
                           \usecounter{enumi}}%
12.1128
                           \def\newblock{\hskip.11em plus.33em minus.07em}%
12.1129
                           \sloop \club penalty 4000 \widow penalty \club penalty
12.1130
                           \sfcode'\.=1000\relax}
12.1131
12.1132
12.1133 \@ifundefined{indexname}%
                         12 1134
12.1135
                         \columnseprule \z@
                         \columnsep 35pt\twocolumn[\@makeschapterhead{\indexname}]%
12.1136
12.1137
                              12.1138

                                {\centering
12.1162
                                  \ifnum \c@secnumdepth >-2\relax
12.1163
                                        \huge\bf \partname{} \thepart
12.1164
12.1165
                                   \par
12.1166
                                   \vskip 20pt \fi
12.1167
                                   \Huge \bf
12.1168
                                  #1 \epsilon {0endpart} {}%
12.1169 \or
```

Now we address the case where babel.def is read after the letter style. The letter document style defines the macro \opening and some other macros

that are specific to letter. This means that we have to redefine other macros, compared to the previous two cases.

First two macros for the material at the end of a letter, the \cc and \encl macros.

```
12.1170 \@ifundefined{ccname}%
12.1171
                                              {\def\cc#1{\par\noindent}}
                                                  \parbox[t] {\textwidth}%
12.1172
                                                  {\Ohangfrom{\rm \ccname : }\ignorespaces #1\strut}\par}}{}
12.1173
12.1174
12.1175 \@ifundefined{enclname}%
                                              {\def\encl#1{\par\noindent}}
12.1176
                                                  \parbox[t] {\textwidth}%
12.1177
12.1178
                                                   {\c constraint} {\c constra
                               The last thing we have to do here is to redefine the headings pagestyle:
12.1179 \@ifundefined{headtoname}%
12.1180
                                              {\def\ps@headings{%
                                                               12.1181
                                                                                                                                \@date \hfil \pagename{} \thepage}%
12 1182
                                                                \label{lem:def_def_def} $$ \def_{0oddfoot{}}}{}
12.1183
```

This was the last of the four standard document styles, so if \doc@style has another value we do nothing and just close the if construction.

```
12.1184 \fi
```

Here ends the code that can be optionally included when a version of L<sup>A</sup>T<sub>E</sub>X is in use that is dated *before* December 1991.

```
12.1185 (/names)
12.1186 (/core)
```

### 12.15 Cross referencing macros

The LATEX book states:

The *key* argument is any sequence of letters, digits, and punctuation symbols; upper- and lowercase letters are regarded as different.

When the above quote should still be true when a document is typeset in a language that has active characters, special care has to be taken of the category codes of these characters when they appear in an argument of the cross referencing macros.

When a cross referencing command processes its argument, all tokens in this argument should be character tokens with category 'letter' or 'other'.

The only way to accomplish this in most cases is to use the trick described in the T<sub>E</sub>Xbook [1] (Appendix D, page 382). The primitive \meaning applied to a token expands to the current meaning of this token. For example, '\meaning\A' with \A defined as '\def\A#1{\B}' expands to the characters 'macro:#1->\B' with all category codes set to 'other' or 'space'.

\bbl@redefine

To redefine a command, we save the old meaning of the macro. Then we redefine it to call the original macro with the 'sanitized' argument. The reason why we do it this way is that we don't want to redefine the LATEX macros completely in case their definitions change (they have changed in the past).

Because we need to redefine a number of commands we define the command \bbl@redefine which takes care of this. It creates a new control sequence, \org@...

```
12.1187 \end{shorthands} $$ 12.1188 \end{shorthands} $$ 12.1188 \end{shorthands} $$ 12.1189 \end{shorthands} \end{shorthands} $$ edef\bbl@tempa{expandafter\end{shorthands}}, $$ 12.1190 \expandafter\end{shorthands} $$ expandafter\end{shorthands} $
```

This command should only be used in the preamble of the document.

 $12.1192 \ensuremath{\verb||Conlypreamble||}$ 

\bbl@redefine@long This version of \babel@redefine can be used to redefine \long commands such as \ifthenelse.

\bbl@redefinerobust For commands that are redefined, but which might be robust we need a slightly more intelligent macro. A robust command foo is defined to expand to \protect\foo\_\protec

```
12.1198 \def\bbl@redefinerobust#1{%
        \edef\bbl@tempa{\expandafter\@gobble\string#1}%
        \expandafter\ifx\csname \bbl@tempa\space\endcsname\relax
12.1200
12.1201
          \expandafter\let\csname org@\bbl@tempa\endcsname#1
12.1202
          \expandafter\edef\csname\bbl@tempa\endcsname{\noexpand\protect
12.1203
            \expandafter\noexpand\csname\bbl@tempa\space\endcsname}%
12.1204
          \expandafter\let\csname org@\bbl@tempa\expandafter\endcsname
12.1205
12.1206
                           \csname\bbl@tempa\space\endcsname
12.1207
```

The result of the code above is that the command that is being redefined is always robust afterwards. Therefor all we need to do now is define \foo\_\text{loo}.

```
12.1208 \expandafter\def\csname\bbl@tempa\space\endcsname}
```

This command should only be used in the preamble of the document.

```
12.1209 \@onlypreamble\bbl@redefinerobust
```

\newlabel The macro \label writes a line with a \newlabel command into the .aux file to define labels.

\@newl@bel We need to change the definition of the L⁴TEX-internal macro \@newl@bel. This is needed because we need to make sure that shorthand characters expand to their non-active version.

```
12.1212 \ensuremath{\mbox{def}\mbox{\mbox{\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{}\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$
```

First we open a new group to keep the changed setting of \protect local and then we set the @safe@actives switch to true to make sure that any shorthand that appears in any of the arguments immediately expands to its non-active self.

```
{%
12 1213
           \@safe@activestrue
12.1214
           \@ifundefined{#1@#2}%
12.1215
             \relax
12.1216
12.1217
               \gdef \@multiplelabels {%
12.1218
                  \ClatexCwarningCnoCline{There were multiply-defined labels}}%
12.1219
               \@latex@warning@no@line{Label '#2' multiply defined}%
12.1220
             }%
12.1221
           \global\Qnamedef{#10#2}{#3}%
12.1222
12.1223
           }%
        }
12 1224
```

An internal LaTeX macro used to test if the labels that have been written on the .aux file have changed. It is called by the \enddocument macro. This macro needs to be completely rewritten, using \meaning. The reason for this is that in some cases the expansion of \#10#2 contains the same characters as the #3; but the character codes differ. Therefor LaTeX keeps reporting that the labels may have changed.

```
12.1225 \CheckCommand*\@testdef[3]{%
12.1226 \def\reserved@a{#3}%
12.1227 \expandafter \ifx \csname #1@#2\endcsname \reserved@a
12.1228 \else
12.1229 \@tempswatrue
12.1230 \fi}
```

Now that we made sure that **\@testdef** still has the same definition we can rewrite it. First we make the shorthands 'safe'.

```
12.1231 \def\@testdef #1#2#3{%
12.1232 \@safe@activestrue
```

Then we use \bbl@tempa as an 'alias' for the macro that contains the label which is being checked.

12.1233 \expandafter\let\expandafter\bbl@tempa\csname #1@#2\endcsname

Then we define \bbl@tempb just as \@newl@bel does it.

```
12.1234 \def\bbl@tempb{#3}%
12.1235 \@safe@activesfalse
```

When the label is defined we replace the definition of \bbl@tempa by its meaning.

```
12.1236 \ifx\bbl@tempa\relax
12.1237 \else
12.1238 \edef\bbl@tempa{\expandafter\strip@prefix\meaning\bbl@tempa}%
12.1239 \fi
```

We do the same for \bbl@tempb.

```
1240 \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
```

If the label didn't change, \bbl@tempa and \bbl@tempb should be identical macros.

```
12.1241 \ifx \bbl@tempa \bbl@tempb
12.1242 \else
12.1243 \@tempswatrue
12.1244 \fi}
```

\ref The same holds for the macro \ref that references a label and \pageref to refer-\pageref ence a page. So we redefine \ref and \pageref. While we change these macros, we make them robust as well (if they weren't already) to prevent problems if they should become expanded at the wrong moment.

\@citex The macro used to cite from a bibliography, \cite, uses an internal macro, \@citex. It is this internal macro that picks up the argument(s), so we redefine this internal macro and leave \cite alone. The first argument is used for typesetting, so the shorthands need only be deactivated in the second argument.

```
\label{localizero} $$12.1249 \mathbb \mathbb{C}_{12.1250} \ \colored continuous construction of the proof of the proof
```

Unfortunately, the packages natbib and cite need a different definition of \@citex... To begin with, natbib has a definition for \@citex with three arguments... We only know that a package is loaded when \begin{document} is executed, so we need to postpone the different redefinition.

```
12.1252 \AtBeginDocument{% 12.1253 \@ifpackageloaded{natbib}{%
```

Notice that we use \def here instead of \bbl@redefine because \org@@citex is already defined and we don't want to overwrite that definition (it would result in parameter stack overflow because of a circular definition).

The package cite has a definition of \@citex where the shorthands need to be turned off in both arguments.

```
12.1258 \AtBeginDocument{\%}
12.1259 \@ifpackageloaded{cite}{\%}
12.1260 \def\@citex[#1] #2{\%}
12.1261 \@safe@activestrue\org@@citex[#1]{#2}\@safe@activesfalse}\%
12.1262 \}{}}
```

\mathbb{nocite} The macro \mathbb{nocite} which is used to instruct BiBTEX to extract uncited references from the database.

```
12.1263 \bbl@redefine\nocite#1{%  
12.1264 \@safe@activestrue\org@nocite{#1}\@safe@activesfalse}
```

The macro that is used in the .aux file to define citation labels. When packages such as natbib or cite are not loaded its second argument is used to typeset the citation label. In that case, this second argument can contain active characters but is used in an environment where \@safe@activestrue is in effect. This switch needs to be reset inside the \hbox which contains the citation label. In order to determine during .aux file processing which definition of \bibcite is needed we define \bibcite in such a way that it redefines itself with the proper definition.

```
12.1265 \bbl@redefine\bibcite{%
```

We call \bbl@cite@choice to select the proper definition for \bibcite. This new definition is then activated.

```
12.1266 \bbl@cite@choice
12.1267 \bibcite}
```

\bbl@bibcite The macro \bbl@bibcite holds the definition of \bibcite needed when neither natbib nor cite is loaded.

```
12.1268 \def\bbl@bibcite#1#2{%
12.1269 \org@bibcite{#1}{\@safe@activesfalse#2}}
```

\bbl@cite@choice The macro \bbl@cite@choice determines which definition of \bibcite is needed.

```
12.1270 \def\bbl@cite@choice{%
```

First we give \bibcite its default definition.

```
12.1271 \global\let\bibcite\bbl@bibcite
```

Then, when natbib is loaded we restore the original definition of \bibcite.

```
12.1272 \@ifpackageloaded{natbib}{\global\let\bibcite\org@bibcite}{}%
```

For cite we do the same.

```
12.1273 \@ifpackageloaded{cite}{\global\let\bibcite\org@bibcite}{}%
```

Make sure this only happens once.

```
12.1274 \global\let\bbl@cite@choice\relax
12.1275 }
```

When a document is run for the first time, no .aux file is available, and \bibcite will not yet be properly defined. In this case, this has to happen before the document starts.

```
12.1276 \AtBeginDocument{\bbl@cite@choice}
```

\Cbibitem One of the two internal LATEX macros called by \bibitem that write the citation label on the .aux file.

```
12.1277 \bbl@redefine\@bibitem#1{%
12.1278 \@safe@activestrue\org@@bibitem{#1}\@safe@activesfalse}
```

## 12.16 marks

\markright Because the output routine is asynchronous, we must pass the current language attribute to the head lines, together with the text that is put into them. To achieve this we need to adapt the definition of \markright and \markboth somewhat.

```
12.1279 \verb|\bbl@redefine\markright#1{%}|
```

First of all we temporarily store the language switching command, using an expanded definition in order to get the current value of \languagename.

```
12.1280 \edef\bbl@tempb{\noexpand\protect
12.1281 \noexpand\foreignlanguage{\languagename}}%
```

Then, we check whether the argument is empty; if it is, we just make sure the scratch token register is empty.

```
12.1282 \def\bbl@arg{#1}%
12.1283 \ifx\bbl@arg\@empty
12.1284 \toks@{}%
12.1285 \else
```

Next, we store the argument to \markright in the scratch token register, together with the expansion of \bbl@tempb (containing the language switching command) as defined before. This way these commands will not be expanded by using \edef later on, and we make sure that the text is typeset using the correct language settings. While doing so, we make sure that active characters that may end up in the mark are not disabled by the output routine kicking in while \@safe@activestrue is in effect.

Then we define a temporary control sequence using \edef.

```
12.1289 \edef\bbl@tempa{%
```

When \bbl@tempa is executed, only \languagename will be expanded, because of the way the token register was filled.

```
12.1290 \noexpand\org@markright{\the\toks@}}% 12.1291 \bbl@tempa  
12.1292 }
```

\markboth The definition of \markboth is equivalent to that of \markright, except that we need two token registers. The document classes report and book define and set the headings for the page. While doing so they also store a copy of \markboth in \markboth. Therefor we need to check whether \markboth has already been set. If so we need to do that again with the new definition of \makrboth.

```
12.1293 \ifx\@mkboth\markboth
12.1294 \def\bbl@tempc{\let\@mkboth\markboth}
12.1295 \else
12.1296 \def\bbl@tempc{}
12.1297 \fi
```

Now we can start the new definition of \markboth

```
12.1298 \bl@redefine\markboth#1#2{%}
12.1299
         \edef\bbl@tempb{\noexpand\protect
12.1300
           \noexpand\foreignlanguage{\languagename}}%
         \def\bbl@arg{#1}%
12 1301
         \ifx\bbl@arg\@empty
12.1302
12.1303
           \t oks @{}%
12.1304
         \else
          \expandafter\toks@\expandafter{%
12.1305
                     \bbl@tempb{\protect\bbl@restore@actives#1}}%
12.1306
12.1307
         \def\bbl@arg{#2}%
12.1308
12.1309
         \ifx\bbl@arg\@empty
12.1310
           \textstyle \text{\toks8}{}
12.1311
         \else
           \expandafter\toks8\expandafter{%
12 1312
                     \bbl@tempb{\protect\bbl@restore@actives#2}}%
12.1313
12.1314
12.1315
         \edef\bbl@tempa{%
12.1316
           \noexpand org@markboth{\the \toks@}{\the \toks8}}\%
12.1317
         \bbl@tempa
12.1318 }
```

```
and copy it to \mbox{@mkboth} if necesary. 12.1319 \mbox{bbl@tempc} 12.1320 \mbox{/core} | \mbox{shorthands} \rangle
```

### 12.17 Encoding issues (part 2)

\TeX Because documents may use font encodings other than one of the latin encodings, we make sure that the logos of TeX and LATeX always come out in the right encoding.

```
12.1321 \(\score\)
12.1322 \(\bbl\)@redefine\TeX{\textlatin\{\org@TeX}\}
12.1323 \(\bbl\)@redefine\LaTeX\{\textlatin\{\org@LaTeX\}\}
12.1324 \(\core\)
```

### 12.18 Preventing clashes with other packages

#### 12.18.1 ifthen

\ifthenelse

Sometimes a document writer wants to create a special effect depending on the page a certain fragment of text appears on. This can be achieved by the following piece of code:

In order for this to work the argument of \isodd needs to be fully expandable. With the above redefinition of \pageref it is not in the case of this example. To overcome that, we add some code to the definition of \ifthenelse to make things work.

The first thing we need to do is check if the package ifthen is loaded. This should be done at \begin{document} time.

```
12.1325 \*package\
12.1326 \AtBeginDocument{%
12.1327 \@ifpackageloaded{ifthen}{%
```

Then we can redefine \ifthenelse:

```
12.1328 \qquad \verb|\bbl@redefine@long\ifthenelse#1#2#3{%}
```

We want to revert the definition of \pageref to its original definition for the duration of \ifthenelse, so we first need to store its current meaning.

```
12.1329 \let\bbl@tempa\pageref
12.1330 \let\pageref\org@pageref
```

Then we can set the \@safe@actives switch and call the original \ifthenelse. In order to be able to use shorthands in the second and third arguments of \ifthenelse the resetting of the switch and the definition of \pageref happens inside those arguments.

```
12.1331 \@safe@activestrue
12.1332 \org@ifthenelse{#1}{%
12.1333 \let\pageref\bbl@tempa
12.1334 \@safe@activesfalse
12.1335 #2}{%
```

#### 12.18.2 varioref

\@@vpageref When the package varioref is in use we need to modify its internal command \vrefpagenum \@@vpageref in order to prevent problems when an active character ends up in \Ref the argument of \vref.

```
12.1342 \AtBeginDocument{%
        \@ifpackageloaded{varioref}{%
12.1343
           \bbl@redefine\@@vpageref#1[#2]#3{%
12.1344
             \@safe@activestrue
12.1345
             \org@@@vpageref{#1}[#2]{#3}%
12 1346
             \@safe@activesfalse}%
12 1347
    The same needs to happen for \vrefpagenum.
           \bbl@redefine\vrefpagenum#1#2{%
12.1348
12.1349
             \@safe@activestrue
             \org@vrefpagenum{#1}{#2}%
12.1350
             \@safe@activesfalse}%
12.1351
```

The package varioref defines  $\Ref$  to be a robust command wich uppercases the first character of the reference text. In order to be able to do that it needs to access the exandable form of  $\ref$ . So we employ a little trick here. We redefine the (internal) command  $\Ref_{\sqcup}$  to call  $\ref$  instead of  $\ref$ . The disadvantgage of this solution is that whenever the derfinition of  $\Ref$  changes, this definition needs to be updated as well.

#### 12.18.3 hhline

hhline Delaying the activation of the shorthand characters has introduced a problem with the hhline package. The reason is that it uses the ':' character which is made active by the french support in babel. Therefor we need to reload the package when the ':' is an active character.

So at \begin{document} we check whether hhline is loaded.

```
12.1356 \AtBeginDocument{\%}
12.1357 \@ifpackageloaded{hhline}\%
```

Then we check whether the expansion of \normal@char: is not equal to \relax.

```
12.1358 {\expandafter\ifx\csname normal@char\string:\endcsname\relax 12.1359 \else
```

In that case we simply reload the package. Note that this happens after the category code of the @-sign has been changed to other, so we need to temporarily change it to letter again.

```
12.1360 \makeatletter
12.1361 \def\@currname{hhline}\input{hhline.sty}\makeatother
12.1362 \fi}%
12.1363 {}}
```

### 12.18.4 hyperref

\pdfstringdefDisableCommands

Although a number of interworking problems between babel and hyperref are tackled by hyperref itself we need to take care of correctly handling the shorthand characters. When they get expanded inside a bookmark a warning will appear in the log file which can be prevented. This is done by informing hyperref that it should the shorthands as defined on the system level rather than at the user level.

```
12.1364 \AtBeginDocument{%

12.1365 \@ifundefined{pdfstringdefDisableCommands}%

12.1366 \{}%

12.1367 \{\pdfstringdefDisableCommands{%}

12.1368 \languageshorthands{system}}%

12.1369 \}%

12.1370 }
```

#### 12.18.5 General

\FOREIGNLANGUAGE

The package fancyhdr treats the running head and fout lines somewhat differently as the standard classes. A symptom of this is that the command \foreignlanguage which babel adds to the marks can end up inside the argument of \MakeUppercase. To prevent unexpected results we need to define \FOREIGNLANGUAGE here.

```
12.1371 \DeclareRobustCommand{\FOREIGNLANGUAGE}[1]{% 12.1372 \lowercase{\foreignlanguage{#1}}} 12.1373 \langle \text{package} \rangle
```

 $\verb|\nfss@catcodes|$ 

LATEX's font selection scheme sometimes wants to read font definition files in the middle of processing the document. In order to guard against any characters having the wrong \catcodes it always calls \nfss@catcodes before loading a file. Unfortunately, the characters " and ' are not dealt with. Therefor we have to add them until LATEX does that herself.

```
12.1374 \( *core | shorthands \)
12.1375 \( ifx \nfss@catcodes \@undefined \)
12.1376 \( else \)
12.1377 \( addto \nfss@catcodes \% \)
12.1378 \( \@makeother \' '\% \)
12.1379 \( \@makeother \' '\% \)
12.1380 \( \}
12.1381 \( fi \)
12.1382 \( /core | shorthands \)
```

# 13 Local Language Configuration

\loadlocalcfg At some sites it may be necessary to add site-specific actions to a language definition file. This can be done by creating a file with the same name as the language

definition file, but with the extension .cfg. For instance the file norsk.cfg will be loaded when the language definition file norsk.ldf is loaded.

```
13.1 \langle *core \rangle
```

For plain-based formats we don't want to override the definition of \loadlocalcfg from plain.def.

Just to be compatible with LATEX 2.09 we add a few more lines of code:

```
13.11 \verb|\ifx\\QunexpandableQprotect\\Qundefined
        \def\@unexpandable@protect{\noexpand\protect\noexpand}
13.12
13.13
        \long\def \protected@write#1#2#3{%
13.14
               \begingroup
13.15
                \let\thepage\relax
13.16
                #2%
                \verb|\label{constraints}| \textbf{let}| \textbf{protect}| \textbf{@unexpandable@protect}|
13.17
                \edef\reserved@a{\write#1{#3}}%
13.18
                \reserved@a
13.19
13.20
               \endgroup
               \if@nobreak\ifvmode\nobreak\fi\fi
13.21
13.22 }
13.23 \fi
13.24 (/core)
```

### 14 Driver files for the documented source code

Since babel version 3.4 all source files that are part of the babel system can be typeset separately. But to typeset them all in one document, the file babel.drv can be used. If you only want the information on how to use the babel system and what goodies are provided by the language-specific files, you can run the file user.drv through LATEX to get a user guide.

```

### 15 Conclusion

A system of document options has been presented that enable the user of IATEX to adapt the standard document classes of IATEX to the language he or she prefers to use. These options offer the possibility of switching between languages in one document. The basic interface consists of using one option, which is the same for all standard document classes.

In some cases the language definition files provide macros that can be useful to plain TEX users as well as to LATEX users. The babel system has been implemented so that it can be used by both groups of users.

### 16 Acknowledgements

I would like to thank all who volunteered as  $\beta$ -testers for their time. I would like to mention Julio Sanchez who supplied the option file for the Spanish language and Maurizio Codogno who supplied the option file for the Italian language. Michel Goossens supplied contributions for most of the other languages. Nico Poppelier helped polish the text of the documentation and supplied parts of the macros for the Dutch language. Paul Wackers and Werenfried Spit helped find and repair bugs.

During the further development of the babel system I received much help from Bernd Raichle, for which I am grateful.

### 17 The Esperanto language

The file esperanto.dtx<sup>10</sup> defines all the language-specific macros for the Esperanto language.

For this language the character ^ is made active. In table 2 an overview is given of its purpose.

- c gives ĉ with hyphenation in the rest of the word allowed, this works for c, C, g, G, H, J, s, S, z, Z
- h prevents h from becoming too tall
- ^j gives ĵ
- ^u gives ŭ, with hyphenation in the rest of the word allowed
- ^U gives Ŭ, with hyphenation in the rest of the word allowed
- ` inserts a \discretionary{-}{}{}

Table 2: The functions of the active character for Esperanto.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
17.1 (*code)
```

#### 17.2 \LdfInit{esperanto}\captionsesperanto

When this file is read as an option, i.e. by the \usepackage command, esperanto will be an 'unknown' language in which case we have to make it known. So we check for the existence of \left(1@esperanto) to see whether we have to do something here.

```
17.3 \ifx\l@esperanto\@undefined
```

- 17.4 \Onopatterns{Esperanto}
- 17.5 \adddialect\l@esperantoO\fi

The next step consists of defining commands to switch to the Esperanto language. The reason for this is that a user might want to switch back and forth between languages.

#### $\colonumber$ $\colonumber$ $\colonumber$ captions esperanto

The macro \captionsesperanto defines all strings used in the four standard document classes provided with IATFX.

```
17.6 \add to \captions esperant o \{\%\}
```

      17.26
      \def\proofname{Pruvo}%
17.27
17 28
      \def\glossaryname{Glosaro}%
17.29
```

\dateesperanto The macro \dateesperanto redefines the command \today to produce Esperanto dates.

```
17.30 \def\dateesperanto{%
     januaro\or februaro\or marto\or aprilo\or majo\or junio\or
17.32
17.33
       julio\or a\u{u}gusto\or septembro\or oktobro\or novembro\or
17.34
       decembro\fi,\space \number\year}}
```

\extrasesperanto \noextrasesperanto The macro \extrasesperanto performs all the extra definitions needed for the Esperanto language. The macro \noextrasesperanto is used to cancel the actions of \extrasesperanto.

For Esperanto the ^ character is made active. This is done once, later on its definition may vary.

```
17.35 \initiate@active@char{^}
```

Because the character ^ is used in math mode with quite a different purpose we need to add an extra level of evaluation to the definition of the active ^. It checks whether math mode is active; if so the shorthand mechanism is bypassed by a direct call of \normal@char^.

```
17.36 \ \texttt{\addto\extrasesperanto\{\languageshorthands\{esperanto\}\}}
17.37 \addto\extrasesperanto{\bbl@activate{^}}
17.38 \add to \no extrase sperant o {\bbl@deactivate \{^\}}
```

In order to prevent problems with the active ^ we add a shorthand on system level which expands to a 'normal \cap .

17.39 \declare@shorthand{system}{^}{\csname normal@char\string^\endcsname}

And here are the uses of the active ^:

```
17.40 \ensuremath{\mbox{declare@shorthand{esperanto}{^c}{\mbox{c}\mbox{allowhyphens}}}
17.41 \declare@shorthand{esperanto}{^C}{^{C}}\allowhyphens}
17.42 \declare@shorthand{esperanto}_{^g}_{\allowhyphens}
17.43 \declare@shorthand{esperanto}{^G}{^G}\allowhyphens}
17.44 \declare@shorthand{esperanto}{^h}{h\llap{\^{}}\allowhyphens}
17.45 \declare@shorthand{esperanto}{^H}{^{H}}\allowhyphens}
17.46 \declare@shorthand{esperanto}{^j}{^{\j}}\allowhyphens}
17.47 \declare@shorthand{esperanto}{^J}{^{J}}\allowhyphens}
17.48 \declare@shorthand{esperanto}{^s}{^{s}}\dlowhyphens}
17.50 \label{lem:condition} $$17.50 \end{esperanto} {^u}_{u} u\allowhyphens}
```

```
 17.51 \end{esperanto} {^U}_{\u U\allowhyphens} \\ 17.52 \end{esperanto} {^|}_{\u U\allowhyphens}
```

\Esper In esperant.sty Jörg Knappen provides the macros \esper and \Esper that can be used instead of \alph and \Alph. These macros are available in this file as well.

Their definition takes place in two steps. First the toplevel.

```
17.53 \def\esper#1{\Qesper{\commuse{c@#1}}} \\ 17.54 \def\Esper#1{\QEsper{\commuse{c@#1}}}
```

Then the second level.

```
17.55 \def\@esper#1{%
```

```
17.56 \ifcase#1\or a\or b\or c\or \^c\or d\or e\or f\or g\or \^g\or 17.57 h\or h\llap{\^{}}\or i\or j\or \^j\or k\or l\or m\or n\or o\or 17.58 p\or r\or s\or \^s\or t\or u\or \u\u\or v\or z\else\@ctrerr\fi} 17.59 \def\@Esper#1{%

17.67 decembro\fi, \space \number\year}
```

```
17.68 \ldf@finish{esperanto}
17.69 \langle /code \rangle
```

### 18 The Interlingua language

The file interlingua.dtx<sup>11</sup> defines all the language definition macros for the Interlingua language. This file was contributed by Peter Kleiweg, kleiweg at let.rug.nl.

Interlingua is an auxiliary language, built from the common vocabulary of Spanish/Portuguese, English, Italian and French, with some normalisation of spelling. The grammar is very easy, more similar to English's than to neolatin languages. The site http://www.interlingua.com is mostly written in interlingua (as is http://interlingua.altervista.org), in case you want to read some sample of it.

You can have a look at the grammar at http://www.geocities.com/linguablau
The macro \LdfInit takes care of preventing that this file is loaded more than
once, checking the category code of the @ sign, etc.

```
18.1 (*code)
18.2 \LdfInit{interlingua}{captionsinterlingua}
```

When this file is read as an option, i.e. by the \usepackage command, interlingua could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lointerlingua to see whether we have to do something here.

```
18.3 \ifx\undefined\l@interlingua
18.4 \@nopatterns{Interlingua}
18.5 \adddialect\l@interlingua0\fi
```

The next step consists of defining commands to switch to (and from) the Interlingua language.

\interlinguahyphenmins

This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

 $18.6 \verb|\providehyphenmins{interlingua}{{\tt tw@}tw@}|$ 

\captionsinterlingua The macro \captionsinterlingua defines all strings used in the four standard document classes provided with LATEX.

```
18.7 \def\captionsinterlingua{%
      \def\prefacename{Prefacio}%
18.8
      \def\refname{Referentias}%

18.34     decembre\fi
18.35     \space \number\year}}
```

\extrasinterlingua \noextrasinterlingua

The macro \extrasinterlingua will perform all the extra definitions needed for the Interlingua language. The macro \noextrasinterlingua is used to cancel the actions of \extrasinterlingua. For the moment these macros are empty but they are defined for compatibility with the other language definition files.

```
18.36 \addto\extrasinterlingua{}
18.37 \addto\noextrasinterlingua{}
```

```
18.38 \ldf@finish{interlingua}
18.39 \ldf@code
```

# 19 The Dutch language

The file  $\mathtt{dutch.dtx^{12}}$  defines all the language-specific macros for the Dutch language and the 'Afrikaans' version<sup>13</sup> of it.

For this language the character " is made active. In table 3 an overview is given of its purpose. One of the reasons for this is that in the Dutch language a word with a dieresis can be hyphenated just before the letter with the umlaut, but the dieresis has to disappear if the word is broken between the previous letter and the accented letter.

In [3] the quoting conventions for the Dutch language are discussed. The preferred convention is the single-quote Anglo-American convention, i.e. 'This is a quote'. An alternative is the slightly old-fashioned Dutch method with initial double quotes lowered to the baseline, "This is a quote", which should be typed as "'This is a quote".

```
"a \"a which hyphenates as -a; also implemented for the other letters.
```

- "y puts a negative kern between i and j
- "Y puts a negative kern between I and J
- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- " to produce a hyphencharcter without the following \discretionary{}{}.
- "" to produce an invisible 'breakpoint'.
- "' lowered double left quotes (see example below).
- "' normal double right quotes.
- \- like the old \-, but allowing hyphenation in the rest of the word.

Table 3: The extra definitions made by dutch.ldf

```
19.2 %
        \cs{CurrentOption}}
19.3 %
        The macro |\LdfInit| takes care of preventing that this file is
19.4 %

```

\extrasdutch The macros \extrasdutch and \captionsafrikaans will perform all the ex-\extrasafrikaans tra definitions needed for the Dutch language. The macros \noextrasdutch \noextrasdutch and noextrasafrikaans is used to cancel the actions of \extrasdutch and \captionsafrikaans.

For Dutch the "character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the "character for shorthands; we specify that the dutch group of shorthands should be used.

```
19.93 \initiate@active@char{"}
```

Both version of the language use the same set of shorthand definitions althoug the 'ij' is not used in Afrikaans.

```
\label{lem:constraint} $$19.94 \end{extras}\currentOption} {\languageshorthands{dutch}} $$19.95 \expandafter\addto\csname extras\CurrentOption\endcsname{\%} $$19.96 \bbl@activate{"}}
```

The 'umlaut' character should be positioned lower on all vowels in Dutch texts.

```
19.97 \expandafter\addto\csname extras\CurrentOption\endcsname{% 19.98 \umlautlow\umlautelow} 19.99 \Onamedef{noextras\CurrentOption}{% 19.100 \umlauthigh}
```

\dutchhyphenmins The dutch hyphenation patterns can be used with \lefthyphenmin set to 2 and \afrikaanshyphenmins \righthyphenmin set to 3.

```
19.101 \providehyphenmins{\CurrentOption}{\tw0\thr00}
```

\Otrema In the Dutch language vowels with a trema are treated specially. If a hyphenation occurs before a vowel-plus-trema, the trema should disappear. To be able to do this we could first define the hyphenation break behaviour for the five vowels, both lowercase and uppercase, in terms of \discretionary. But this results in a large \if-construct in the definition of the active ". Because we think a user should not use " when he really means something like ',' we chose not to distinguish between vowels and consonants. Therefore we have one macro \Otrema which specifies the hyphenation break behaviour for all letters.

```
19.102 \end{figure} 19.1
```

Now we can define the doublequote macros: the tremas,

```
19.103 \declare@shorthand{dutch}{"a}{\textormath{\@trema a}{\ddot a}}
 19.104 \declare@shorthand{dutch}{"e}{\textormath{\@trema e}{\ddot e}}
 {\allowhyphens\discretionary{-}{i}{\"{\i}}\allowhyphens}% }
19.107
                                 {\ddot \imath}}
19.108 \end{dutch} {\tt "o}{\text{textormath}} {\tt Otrema o}{\text{dutch}} {\tt o}{\text{dot o}} {\tt o} {\tt o} 
19.109 \ \ declare@shorthand{dutch}{"u}{\text{\colored}} \ \ u}{\text{\colored}} \ \ \ u}{\text{\colored}}
             dutch quotes,
19.110 \declare@shorthand{dutch}{"'}{%
                           \textormath{\quotedblbase}{\mbox{\quotedblbase}}}
19.112 \declare@shorthand{dutch}{"'}}{%
                               \textormath{\textquotedblright}{\mbox{\textquotedblright}}}
             and some additional commands:
```

```
19.116 \declare@shorthand{dutch}{"|}{%
19.117  \textormath{\discretionary{-}{}{\kern.03em}}{}}
19.118 \declare@shorthand{dutch}{""}{\hskip\z@skip}
19.119 \declare@shorthand{dutch}{"y}{\textormath{\ij{}}{\ddot y}}
19.120 \declare@shorthand{dutch}{"Y}{\textormath{\IJ{}}{\ddot Y}}
To enable hyphenation in two words, written together but separated by a slash, as in 'uitdrukking/opmerking' we define the command "/.
```

\- All that is left now is the redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TeX in this respect is very unfortunate for languages such as Dutch and German, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation position on top of the ones that TeX can generate from the hyphenation patterns.

```
19.127 \label{ldf@finish} \currentOption 19.128 \end{code}
```

# 20 The English language

The file english.dtx<sup>14</sup> defines all the language definition macros for the English language as well as for the American and Australian version of this language. For the Australian version the British hyphenation patterns will be used, if available, for the Canadian variant the American patterns are selected.

For this language currently no special definitions are needed or available.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
20.1 (*code)
20.2 \LdfInit\CurrentOption{date\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, english could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lognalish to see whether we have to do something here.

We allow for the british english patterns to be loaded as either 'british', or 'UKenglish'. When neither of those is known we try to define \lenglish as an alias for \lenglish or \lenglish.

```

```

 $<sup>^{14}\</sup>mathrm{The}$  file described in this section has version number v3.3o and was last revised on 2005/03/30.

Because we allow 'british' to be used as the babel option we need to make sure that it will be recognised by \selectlanguage. In the code above we have made sure that \l@english was defined. Now we want to make sure that \l@british and \l@UKenglish are defined as well. When either of them is we make them equal to each other, when neither is we fall back to the default, \l@english.

'American' is a version of 'English' which can have its own hyphenation patterns. The default english patterns are in fact for american english. We allow for the patterns to be loaded as 'english' 'american' or 'USenglish'.

```
20.45 \verb|\ifx\l@american\@undefined|\\ 20.46 \verb|\ifx\l@USenglish\@undefined|
```

When the patterns are not know as 'american' or 'USenglish' we add a "dialect".

```
20.47 \qquad \texttt{\adddialect\l@american\l@english} \\ 20.48 \qquad \texttt{\else} \\ 20.49 \qquad \texttt{\let\l@american\l@USenglish} \\ 20.50 \qquad \texttt{\fi} \\ 20.51 \qquad \texttt{\else}
```

Make sure that USenglish is known, even if the patterns were loaded as 'american'.

```
20.52 \ifx\l@USenglish\@undefined
20.53 \let\l@USenglish\l@american
20.54 \fi
20.55 \fi
```

'Canadian' english spelling is a hybrid of British and American spelling. Although so far no special 'translations' have been reported we allow this file to be loaded by the option candian as well.

```
20.56 \ifx\l@canadian\@undefined
20.57 \adddialect\l@canadian\l@american
20.58 \fi
```

'Australian' and 'New Zealand' english spelling seem to be the same as British spelling. Although so far no special 'translations' have been reported we allow this file to be loaded by the options australian and newzealand as well.

```
20.59 \ \texttt{`l@australian\@undefined} \\ 20.60 \ \ \texttt{`adddialect\@uustralian\@british} \\ 20.61 \ \texttt{`fi} \\ 20.62 \ \texttt{`ifx\@newzealand\@undefined} \\ 20.63 \ \ \texttt{`adddialect\@newzealand\@undefined} \\ 20.64 \ \texttt{'fi} \\
```

\englishhyphenmins This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

#### $20.65 \providehyphenmins{\CurrentOption}{\tw0\thr00}$

The next step consists of defining commands to switch to (and from) the English language.

\captionsenglish The macro \captionsenglish defines all strings used in the four standard document classes provided with LATEX.

# 21 The German language

The file germanb.dtx<sup>15</sup> defines all the language definition macros for the German language as well as for the Austrian dialect of this language<sup>16</sup>.

For this language the character " is made active. In table 4 an overview is given of its purpose. One of the reasons for this is that in the German language some character combinations change when a word is broken between the combination. Also the vertical placement of the umlaut can be controlled this way. The quotes

```
"a, also implemented for the other lowercase and
      uppercase vowels.
"s
      to produce the German & (like \ss{}).
"z
      to produce the German & (like \ss{}).
"ck
      for ck to be hyphenated as k-k.
"ff
      for ff to be hyphenated as ff-f, this is also imple-
      mented for l, m, n, p, r and t
"S
      for SS to be \uppercase{"s}.
"Z
      for SZ to be \uppercase{"z}.
н
      disable ligature at this position.
и_
      an explicit hyphen sign, allowing hyphenation in the
      rest of the word.
11 11
      like "-, but producing no hyphen sign (for compund
      words with hyphen, e.g. x-""y).
      for a compound word mark without a breakpoint.
      for a compound word mark with a breakpoint, allow-
      ing hyphenation in the composing words.
11 6
      for German left double quotes (looks like ").
11 )
      for German right double quotes.
"<
      for French left double quotes (similar to \ll).
">
      for French right double quotes (similar to >>).
```

Table 4: The extra definitions made by german.ldf

in table 4 can also be typeset by using the commands in table 5.

When this file was read through the option germanb we make it behave as if german was specified.

 $<sup>^{15}</sup>$ The file described in this section has version number v2.6m and was last revised on 2008/06/01.

 $<sup>^{16}</sup>$ This file is a re-implementation of Hubert Partl's german.sty version 2.5b, see [4].

```
for German left double quotes (looks like ").
\glqq
        for German right double quotes (looks like ").
\grqq
        for German left single quotes (looks like,).
\glq
        for German right single quotes (looks like ').
\grq
\flqq
        for French left double quotes (similar to <<).
\frqq
        for French right double quotes (similar to >>).
        for (French) left single quotes (similar to <).
\flq
        for (French) right single quotes (similar to >).
\frq
        the original quotes character (").
\dq
```

Table 5: More commands which produce quotes, defined by german.ldf

```
21.12 \let\extrasgermanb\extrasgerman
21.13 \let\noextrasgermanb\noextrasgerman
21.14 }
21.15 \fi
```

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
21.16 \text{ (*code)}
21.17 \text{ Ldf Init\CurrentOption{captions\CurrentOption}}
```

When this file is read as an option, i.e., by the \usepackage command, german will be an 'unknown' language, so we have to make it known. So we check for the existence of \logerman to see whether we have to do something here.

```
21.18 \ifx\l@german\@undefined
21.19 \@nopatterns{German}
21.20 \adddialect\l@german0
21.21 \fi
```

For the Austrian version of these definitions we just add another language.

#### 21.22 \adddialect\l@austrian\l@german

The next step consists of defining commands to switch to (and from) the German language.

\captionsgerman Either the macro \captionsgerman or the macro \captionsaustrian will define \captionsaustrian all strings used in the four standard document classes provided with LATEX.

```

     Januar\or Februar\or M\"arz\or April\or Mai\or Juni\or
     Juli\or August\or September\or Oktober\or November\or Dezember\fi}
\space\number\year}}
```

\dateaustrian The macro \dateaustrian redefines the command \today to produce Austrian version of the German dates.

```
21.51 \def\dateaustrian{\def\today{\number\day.~\ifnum1=\month
21.52 J\"anner\else \month@german\fi \space\number\year}}
```

\noextrasgerman \noextrasaustrian

\extrasgerman Either the macro \extrasgerman or the macros \extrasaustrian will per-\extrasaustrian form all the extra definitions needed for the German language. \noextrasgerman is used to cancel the actions of \extrasgerman.

> For German (as well as for Dutch) the "character is made active. This is done once, later on its definition may vary.

```
21.53 \initiate@active@char{"}
21.54 \Onamedef{extras\CurrentOption}{%
21.55 \languageshorthands{german}}
21.56 \expandafter\addto\csname extras\CurrentOption\endcsname{%
21.57 \bbl@activate{"}}
```

Don't forget to turn the shorthands off again.

21.58 \addto\noextrasgerman{\bbl@deactivate{"}}

In order for TEX to be able to hyphenate German words which contain 'f'. (in the OT1 position ^^Y) we have to give the character a nonzero \lccode (see Appendix H, the T<sub>E</sub>Xbook).

```
21.59 \pm 0.59
21.60 \babel@savevariable{\lccode25}%
    \label{lccode25=25}
21.61
```

The umlaut accent macro \" is changed to lower the umlaut dots. The redefinition is done with the help of \umlautlow.

```
21.62 \expandafter\addto\csname extras\CurrentOption\endcsname{%
21.63 \babel@save\"\umlautlow}
21.64 \ensuremath{\mbox{Qnamedef{noextras}\CurrentOption}}{\mbox{\mbox{umlauthigh}}}
```

The german hyphenation patterns can be used with \lefthyphenmin and \righthyphenmin set to 2.

 $21.65 \text{ providehyphenmins{\CurrentOption}{\tw0}}$ 

For German texts we need to make sure that \frenchspacing is turned on.

```
 21.66 \ensuremath{\mbox{$\sim$}} 21.67 \bbl@frenchspacing} \\ 21.68 \ensuremath{\mbox{$\sim$}} 21.69 \bbl@nonfrenchspacing}
```

The code above is necessary because we need an extra active character. This character is then used as indicated in table 4.

To be able to define the function of ", we first define a couple of 'support' macros.

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as ".

```
21.70 \begingroup \catcode \"12
21.71 \def\x{\endgroup
                                          \def\@SS{\mathchar"7019 }

                    \mdqon All that's left to do now is to define a couple of commands for reasons of compat-
\mdqoff ibility with german.sty.
              \c_{21.124} \def\mdqon{\shorthandon{"}}
                    21.125 \end{off{\shorthandoff{"}}}
                    The macro \ldf@finish takes care of looking for a configuration file, setting
                              the main language to be switched on at \begin{document} and resetting the
```

category code of @ to its original value.

```
21.127 \ldf@finish\CurrentOption
21.128 \langle /code \rangle
```

# 22 The German language – new orthography

The file ngermanb.dtx<sup>17</sup> defines all the language definition macros for the German language with the 'new orthography' introduced in August 1998. This includes also the Austrian dialect of this language.

As with the 'traditional' German orthography, the character " is made active, and the commands in table 4 can be used, except for "ck and "ff etc., which are no longer required.

The internal language names are ngerman and naustrian.

When this file was read through the option ngermanb we make it behave as if ngerman was specified.

```
22.1 \def\bbl@tempa{ngermanb}
22.2 \ifx\CurrentOption\bbl@tempa
22.3 \def\CurrentOption{ngerman}
22.4 \fi
```

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
22.5 \; \langle * code \rangle \\ 22.6 \; \label{eq:code} \\ \text{LdfInit} \\ \text{CurrentOption} \\ \text{captions} \\ \text{CurrentOption} \\
```

When this file is read as an option, i.e., by the \usepackage command, ngerman will be an 'unknown' language, so we have to make it known. So we check for the existence of \longerman to see whether we have to do something here.

```
22.7 \ifx\l@ngerman\@undefined
22.8 \@nopatterns{ngerman}
22.9 \adddialect\l@ngerman0
22.10 \fi
```

For the Austrian version of these definitions we just add another language.

#### $22.11 \addialect\l@naustrian\l@ngerman$

The next step consists of defining commands to switch to (and from) the German language.

\captionsngerman Either the macro \captionsngerman or the macro \captionsnaustrian will de-\captionsnaustrian fine all strings used in the four standard document classes provided with LATEX.

```
22.12 \@namedef{captions\CurrentOption}{%

J\"anner\else \month@ngerman\fi \space\number\year}}
```

\noextrasngerman \noextrasnaustrian

\extrasngerman Either the macro \extrasngerman or the macros \extrasnaustrian will per-\extrasnaustrian form all the extra definitions needed for the German language. The macro \noextrasngerman is used to cancel the actions of \extrasngerman.

> For German (as well as for Dutch) the "character is made active. This is done once, later on its definition may vary.

```
22.42 \initiate@active@char{"}
22.43 \@namedef{extras\CurrentOption}{%
22.44 \languageshorthands{ngerman}}
22.45 \expandafter\addto\csname extras\CurrentOption\endcsname{%
22.46 \bbl@activate{"}}
```

Don't forget to turn the shorthands off again.

22.47 \addto\noextrasngerman{\bbl@deactivate{"}}

In order for TEX to be able to hyphenate German words which contain 'f'. (in the OT1 position ^^Y) we have to give the character a nonzero \lccode (see Appendix H, the T<sub>E</sub>Xbook).

```
22.48 \exp{\text{andafter}}\ csname extras\CurrentOption\endcsname {\%}
22.49
      \babel@savevariable{\lccode25}%
      \1 ccode25=25
22.50
```

The umlaut accent macro \" is changed to lower the umlaut dots. The redefinition is done with the help of \umlautlow.

```
22.51 \expandafter\addto\csname extras\CurrentOption\endcsname{%
22.52 \babel@save\"\umlautlow}
22.53 \ensuremath{\mbox{Qnamedef{noextras}\CurrentOption}}{\mbox{\mbox{umlauthigh}}}
```

The current version of the 'new' German hyphenation patterns (dehyphn.tex is to be used with \lefthyphenmin and \righthyphenmin set to 2.

```
22.54 \providehyphenmins{\CurrentOption}{\tw@\tw@}
```

For German texts we need to make sure that \frenchspacing is turned on.

```
22.55 \expandafter\addto\csname extras\CurrentOption\endcsname{% 22.56 \bbl@frenchspacing} 22.57 \expandafter\addto\csname noextras\CurrentOption\endcsname{% 22.58 \bbl@nonfrenchspacing}
```

The code above is necessary because we need an extra active character. This character is then used as indicated in table 4.

To be able to define the function of ", we first define a couple of 'support' macros.

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as ".

```
22.59 begingroup \catcode'\"12
22.60 \def\x{\endgroup}
22.61 \def\QSS{\mathchar"7019 }
22.62 \def\dq{"}}
22.63 \x

Now we can define the doublequote macros: the umlauts,

22.64 \declare@shorthand{ngerman}{"a}{\textormath{\"{a}\allowhyphens}{\ddot a}}
22.65 \declare@shorthand{ngerman}{"0}{\textormath{\"{u}\allowhyphens}{\ddot u}}
22.66 \declare@shorthand{ngerman}{"u}{\textormath{\"{u}\allowhyphens}{\ddot u}}
22.67 \declare@shorthand{ngerman}{"A}{\textormath{\"{A}\allowhyphens}{\ddot A}}
22.68 \declare@shorthand{ngerman}{"U}{\textormath{\"{A}\allowhyphens}{\ddot D}}
22.69 \declare@shorthand{ngerman}{"U}{\textormath{\\"{U}\allowhyphens}{\ddot U}}
```

```
22.82 \declare@shorthand{ngerman}{">}{\frqq} and some additional commands:
```

22.80 \declare@shorthand{ngerman}{"'}{\grqq}
22.81 \declare@shorthand{ngerman}{"<}{\flqq}

\mdqon All that's left to do now is to define a couple of commands for reasons of compat-\mdqoff ibility with german.sty.

```
22.90 \def\mdqon{\shorthandon{"}}
22.91 \def\mdqoff{\shorthandoff{"}}
```

```
22.92 \ldf@finish\CurrentOption 22.93 \langle /code \rangle
```

# 23 The Breton language

The file breton.dtx<sup>18</sup> defines all the language-specific macros for the Breton language.

There are not really typographic rules for the Breton language. It is a local language (it's one of the celtic languages) which is spoken in Brittany (West of France). So we have a synthesis between french typographic rules and english typographic rules. The characters:,;,! and? are made active in order to get a whitespace automatically before these characters.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
23.1 \(\rightarrow\captions\) \(\rightarrow\ca
```

When this file is read as an option, i.e. by the \usepackage command, breton will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lobreton to see whether we have to do something here.

```
23.3 \ifx\l@breton\@undefined
23.4 \@nopatterns{Breton}
23.5 \adddialect\l@bretonO\fi
```

The next step consists of defining commands to switch to the English language. The reason for this is that a user might want to switch back and forth between languages.

\captionsbreton The macro \captionsbreton defines all strings used in the four standard document classes provided with IATEX.

```
23.6 \addto\captionsbreton{%
       \def\prefacename{Rakskrid}%
 23.7
       \def\refname{Daveenno\'u}%
23.8
       \def\abstractname{Dvierra\~n}%
23.9
       \def\bibname{Lennadurezh}%
23.10
       \def\chaptername{Pennad}%
23.11
       \def\appendixname{Stagadenn}%
23.12
       \def\contentsname{Taolenn}%
23.13
23.14
       \def\listfigurename{Listenn ar Figurenno\'u}%
23.15
       \def\listtablename{Listenn an taolenno\'u}%
23.16
       \def\indexname{Meneger}%
23.17
       \def\figurename{Figurenn}%
23.18
       \def\tablename{Taolenn}%
23.19
       \def\partname{Lodenn}%
       \def\enclname{Diello\'u kevret}%
23.20
       \def\ccname{Eilskrid da}%
23.21
       \def\headtoname{evit}
23.22
       \def\pagename{Pajenn}%
23.23
23.24
       \def\seename{Gwelout}%
       \def\alsoname{Gwelout ivez}%
23.25
       \def\proofname{Proof}% <-- needs translation
23.26
23.27
       \def\glossaryname{Glossary}% <-- Needs translation
23.28 }
```

 $<sup>^{18}\</sup>mathrm{The}$  file described in this section has version number v1.0h and was last revised on 2005/03/29.

\datebreton The macro \datebreton redefines the command \today to produce Breton dates.

```
23.29 \def\datebreton{%}
    23.30
       \number\day\fi \space a\space viz\space\ifcase\month\or
23.31
       Genver\or C'hwevrer\or Meurzh\or Ebrel\or Mae\or Mezheven\or
23.32
23.33
       Gouere\or Eost\or Gwengolo\or Here\or Du\or Kerzu\fi
       \space\number\year}}
```

\extrasbreton The macro \extrasbreton will perform all the extra definitions needed for the \noextrasbreton Breton language. The macro \noextrasbreton is used to cancel the actions of \extrasbreton.

> The category code of the characters:, ;,! and? is made \active to insert a little white space.

```
23.35 \initiate@active@char{:}
23.36 \initiate@active@char{;}
23.37 \initiate@active@char{!}
23.38 \initiate@active@char{?}
```

We specify that the breton group of shorthands should be used.

23.39 \addto\extrasbreton{\languageshorthands{breton}}

These characters are 'turned on' once, later their definition may vary.

```
23.40 \addto\extrasbreton{%
      \bbl@activate{:}\bbl@activate{;}%
      \bbl@activate{!}\bbl@activate{?}}
```

Don't forget to turn the shorthands off again.

```
23.43 \addto\noextrasbreton{%
23.44 \bbl@deactivate{:}\bbl@deactivate{;}%
23.45 \bbl@deactivate{!}\bbl@deactivate{?}}
```

The last thing \extrasbreton needs to do is to make sure that \frenchspacing is in effect. If this is not the case the execution of \noextrasbreton will switch it of again.

```
23.46 \addto\extrasbreton{\bbl@frenchspacing}
23.47 \addto\noextrasbreton{\bbl@nonfrenchspacing}
```

\breton@sh@;@ We have to reduce the amount of white space before ;, : and ! when the user types a space in front of these characters. This should only happen outside mathmode, hence the test with \ifmmode.

```
23.48 \declare@shorthand{breton}{;}{%
         \ifmmode
           \string;\space
         \else\relax
23.51
```

In horizontal mode we check for the presence of a 'space' and replace it by a \thinspace.

```
23.52
           \ifhmode
23.53
             \ifdim\lastskip>\z@
                \unskip\penalty\@M\thinspace
23.54
23.55
             \fi
23.56
           \fi
23 57
           \string;\space
23.58
         fi}%
```

\breton@sh@:@ Because these definitions are very similar only one is displayed in a way that the \breton@sh@!@ definition can be easily checked.

```
23.59 \verb|\declare@shorthand{breton}{:}{\%}
       \ifmmode\string:\space
23.60
23 61
       \else\relax
         \ifhmode
23.62
23.63
            \ifdim\lastskip>\z@\unskip\penalty\@M\thinspace\fi
23.64
23.65
          \string:\space
23.66
       fi
23.67 \ensuremath{\mbox{declare@shorthand{breton}{!}{{\%}}}

       \else\relax
          \ifhmode
23.70
            \ifdim\lastskip>\z@\unskip\penalty\@M\thinspace\fi
23 71
          \fi
23.72
          \string!\space
23.73
       \fi}
23.74
```

\breton@sh@?@ For the question mark something different has to be done. In this case the amount of white space that replaces the space character depends on the dimensions of the font.

```
23.75 \declare@shorthand{breton}{?}{%
23.76
        \ifmmode
23.77
          \string?\space
23.78
        \else\relax
23.79
          \ifhmode
23.80
             \ifdim\lastskip>\z@
23.81
                \unskip
                \ensuremath{\mbox{kern}\mbox{fontdimen2}\mbox{font}}
23.82
                \kern-1.4\fontdimen3\font
23.83
             \fi
23 84
          \fi
23.85
23.86
          \string?\space
23.87
```

All that is left to do now is provide the breton user with some extra utilities. Some definitions for special characters.

```
23.88 \DeclareTextSymbol{\at}{64}
23.89 \DeclareTextSymbol{\at}{11}{64}
23.90 \DeclareTextSymbolDefault{\at}{0T1}
23.91 \DeclareTextSymbol{\boi}{0T1}{92}
23.92 \DeclareTextSymbolFault{\boi}{0T1}
23.93 \DeclareTextSymbolDefault{\boi}{0T1}
23.94 \DeclareTextSymbolDefault{\boi}{0T1}

```

# 24 The Welsh language

The file welsh.dtx<sup>19</sup> defines all the language definition macros for the Welsh language.

For this language currently no special definitions are needed or available.

The macro \ldf@init takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
24.1 \langle *code \rangle
24.2 \LdfInit\{welsh\}\{captionswelsh\}
```

When this file is read as an option, i.e. by the \usepackage command, welsh could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lowelsh to see whether we have to do something here.

```
24.3 \ifx\undefined\l@welsh
24.4 \@nopatterns{welsh}
24.5 \adddialect\l@welsh0\fi
```

The next step consists of defining commands to switch to (and from) the Welsh language.

\welshhyphenmins This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

 $24.6 \providehyphenmins{CurrentOption}{\tw0\thr00}$ 

\captionswelsh The macro \captionswelsh defines all strings used in the four standard documentclasses provided with LATEX.

```
24.7 \def\captionswelsh{%
 24.8
       \def\prefacename{Rhagair}%
       \def\refname{Cyfeiriadau}%

# 26 The Scottish language

The file scottish.dtx<sup>21</sup> defines all the language definition macros for the Scottish language.

For this language currently no special definitions are needed or available.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
26.1 \left< *code \right> \\ 26.2 \left< LdfInit{scottish} \right> captionsscottish
```

When this file is read as an option, i.e. by the \usepackage command, scottish could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lescottish to see whether we have to do something here.

```
26.3 \ifx\l@scottish\@undefined
26.4 \@nopatterns{scottish}
26.5 \adddialect\l@scottishO\fi
```

The next step consists of defining commands to switch to (and from) the Scottish language.

\captionsscottish The macro \captionsscottish defines all strings used in the four standard document classes provided with LATEX.

```
26.6 \addto\captionsscottish{%

```

\extrasscottish The macro \extrasscottish will perform all the extra definitions needed for the \noextrasscottish Scottish language. The macro \noextrasscottish is used to cancel the actions of \extrasscottish. For the moment these macros are empty but they are defined for compatibility with the other language definition files.

```
26.37 \addto\extrasscottish{}
26.38 \addto\noextrasscottish{}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
26.39 \ldf@finish{scottish}
_{26.40} \langle /code \rangle
```

# 27 The Greek language

The file  $\mathsf{greek.dtx}^{22}$  defines all the language definition macros for the Greek language, i.e., as it used today with only one accent, and the attribute  $\pi o \lambda \upsilon \tau o \upsilon \kappa \delta$  ("Polutoniko") for typesetting greek text with all accents. This separation arose out of the need to simplify things, for only very few people will be really interested to typeset polytonic Greek text.

\greektext \latintext \textgreek \textlatin \textol The commands \greektext and \latintext can be used to switch to greek or latin fonts. These are declarations.

The commands \textgreek and \textlatin both take one argument which is then typeset using the requested font encoding. The command \greekol switches to the greek outline font family, while the command \textol typests a short text in outline font. A number of extra greek characters are made available through the added text commands \stigma, \qoppa, \sampi, \ddigamma, \Digamma, \euro, \permill, and \vardigamma.

## 27.1 Typing conventions

Entering greek text can be quite difficult because of the many diacritical signs that need to be added for various purposes. The fonts that are used to typeset Greek make this a lot easier by offering a lot of ligatures. But in order for this to work, some characters need to be considered as letters. These characters are <, >,  $\sim$ , ', ', " and |. Therefore their \lccode is changed when Greek is in effect. In order to let \uppercase give correct results, the \uccode of these characters is set to a non-existing character to make them disappear. Of course not all characters are needed when typesetting "modern"  $\mu o \nu o \tau o \nu \iota \kappa \dot{o}$ . In that case we only need the ' and " symbols which are treated in the proper way.

## 27.2 Greek numbering

The Greek alphabetical numbering system, like the Roman one, is still used in everyday life for short enumerations. Unfortunately most Greeks don't know how to write Greek numbers bigger than 20 or 30. Nevertheless, in official editions of the last century and beginning of this century this numbering system was also used for dates and numbers in the range of several thousands. Nowadays this numbering system is primary used by the Eastern Orthodox Church and by certain scholars. It is hence necessary to be able to typeset any Greek numeral up to 999 999. Here are the conventions:

- There is no Greek numeral for any number less than or equal to 0.
- Numbers from 1 to 9 are denoted by letters alpha, beta, gamma, delta, epsilon, stigma, zeta, eta, theta, followed by a mark similar to the mathematical symbol "prime". (Nowadays instead of letter stigma the digraph sigma tau is used for number 6. Mainly because the letter stigma is not always available, so people opt to write down the first two letters of its name

<sup>&</sup>lt;sup>22</sup>The file described in this section has version number v1.3l and was last revised on 2005/03/30. The original author is Apostolos Syropoulos (apostolo@platon.ee.duth.gr), code from kdgreek.sty by David Kastrup dak@neuroinformatik.ruhr-uni-bochum.de was used to enhance the support for typesetting greek texts.

as an alternative. In our implementation we produce the letter stigma, not the digraph sigma tau.)

- Decades from 10 to 90 are denoted by letters iota, kappa, lambda, mu, nu, xi, omikron, pi, qoppa, again followed by the numeric mark. The qoppa used for this purpose has a special zig-zag form, which doesn't resemble at all the original 'q'-like qoppa.
- Hundreds from 100 to 900 are denoted by letters rho, sigma, tau, upsilon, phi, chi, psi, omega, sampi, followed by the numeric mark.
- Any number between 1 and 999 is obtained by a group of letters denoting the hundreds decades and units, followed by a numeric mark.
- To denote thousands one uses the same method, but this time the mark is placed in front of the letter, and under the baseline (it is inverted by 180 degrees). When a group of letters denoting thousands is followed by a group of letters denoting a number under 1000, then both marks are used.

\greeknumeral

\Greeknumeral

Using these conventions one obtains numbers up to 999 999. The command \greeknumeral makes it possible to typeset Greek numerals. There is also an "uppercase" version of this macro: \Greeknumeral.

Another system which was in wide use only in Athens, could express any positive number. This system is implemented in package athnum.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

27.1 (\*code)

27.2 \LdfInit\CurrentOption{captions\CurrentOption}

When the option polutonikogreek was used, redefine  $\CurrentOption$  to prevent problems later on.

```
27.3 \gdef\CurrentOption{greek}%
```

When this file is read as an option, i.e. by the \usepackage command, greek could be an 'unknown' language in which case we have to make it known. So we check for the existence of \logreek to see whether we have to do something here.

 $27.4 \ifx\logreek\oundefined$ 

27.5 \@nopatterns{greek}

7.6 \adddialect\l@greek0\fi

Now we declare the polutoniko language attribute.

#### 27.7 \bbl@declare@ttribute{greek}{polutoniko}{%

This code adds the expansion of \extraspolutonikogreek to \extrasgreek and changes the definition of \today for Greek to produce polytonic month names.

27.8 \expandafter\addto\expandafter\extrasgreek

27.9 \expandafter{\extraspolutonikogreek}%

27.10 \let\captionsgreek\captionspolutonikogreek

 $27.11 \qquad \verb| let\gr@month\gr@c@month|$ 

We need to take some extra precautions in order not to break older documents which still use the old polutonikogreek option.

27.12 \let\l@polutonikogreek\l@greek

 $27.13 \qquad \verb|\laternike| let \| datepolutonik ogreek \| dategreek$ 

 $27.14 \qquad \verb|\let-extraspolutonikogreek| extrasgreek|$ 

```
27.15 \let\noextraspolutonikogreek\noextrasgreek 27.16 }
```

Typesetting Greek texts implies that a special set of fonts needs to be used. The current support for greek uses the cb fonts created by Claudio Beccari<sup>23</sup>. The cb fonts provide all sorts of *font combinations*. In order to use these fonts we define the Local GReek encoding (LGR, see the file greek.fdd). We make sure that this encoding is known to LATEX, and if it isn't we abort.

```
27.17 \InputIfFileExists{lgrenc.def}{%
27.18 \message{Loading the definitions for the Greek font encoding}}{%
27.19 \errhelp{I can't find the lgrenc.def file for the Greek fonts}%
27.20 \errmessage{Since I do not know what the LGR encoding means^\Gamma
27.21 I can't typeset Greek.^\Gamma
27.22 I stop here, while you get a suitable lgrenc.def file}\@@end
```

Now we define two commands that offer the possibility to switch between Greek and Roman encodings.

\greektext The command \greektext will switch from Latin font encoding to the Greek font encoding. This assumes that the 'normal' font encoding is a Latin one. This command is a *declaration*, for shorter pieces of text the command \textgreek should be used.

```
27.24 \DeclareRobustCommand{\greektext}{%
27.25 \fontencoding{LGR}\selectfont
27.26 \def\encodingdefault{LGR}}
```

\textgreek This command takes an argument which is then typeset using the requested font encoding. In order to avoid many encoding switches it operates in a local scope.

```
27.27 \label{leavevmode} $$27.27 \end{\text{\command{\textgreek} [1]{\leavevmode{\greektext $$\#1$}}}$
```

\textol A last aspect of the set of fonts provided with this version of support for typesetting Greek texts is that it contains an outline family. In order to make it available we define the command \textol.

```
 27.28 \left[ \text{Cmro}_{n} \right] \\ 27.29 \left[ \text{Cmro
```

The next step consists in defining commands to switch to (and from) the Greek language.

\greekhyphenmins This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

```
27.30 % Yannis Haralambous has suggested this value 27.31 \providehyphenmins{\CurrentOption}{\Qne\Qne}
```

\captionsgreek The macro \captionsgreek defines all strings used in the four standard document classes provided with LATEX.

```
27.32 \addto\captionsgreek{%
27.33 \def\prefacename{Pr'ologos}%
27.34 \def\refname{Anafor'es}%
```

 $<sup>^{-23}</sup>$ Apostolos Syropoulos wishes to thank him for his patience, collaboration, cooments and suggestions.

27.61 \def\alsoname{bl'epe >ep'ishs}%
27.62 \def\proofname{>Ap'odeixh}%
27.63 }
```

\gr@month The macro \dategreek redefines the command \today to produce greek dates.

The name of the month is now produced by the macro \gr@month since it is needed in the definition of the macro \Grtoday.

```
27.64 \def\gr@month{%
           27 65
                 \ifcase\month\or
           27.66
                   Ianouar'iou\or Febrouar'iou\or Mart'iou\or April'iou\or
           27 67
                   Ma'"iou\or Ioun'iou\or Ioul'iou\or Augo'ustou\or
                   Septembr'iou\or Oktwbr'iou\or Noembr'iou\or Dekembr'iou\fi}
           27.68
           27.69 \def\dategreek{%
                 \def\today{\number\day \space \gr@month\space \number\year}}
\gr@c@greek
           27.71 \def\gr@c@month{%
           27.72
                 \ifcase\month\or > Ianouar'iou\or
                   Febrouar'iou\or Mart'iou\or >April'iou\or Ma"'iou\or
           27.73
                   >Ioun'iou\or >Ioul'iou\or A>ugo'ustou\or Septembr'iou\or
           27.74
                   >Oktwbr'iou\or Noembr'iou\or Dekembr'iou\fi}
           27.75
```

The macro \Grtoday produces the current date, only that the month and the day are shown as greek numerals instead of arabic as it is usually the case.

```
27.76 \def\Grtoday{%
       \verb|\expandafter| Greeknumeral| expandafter{\the| day}| space
27.77
       \gr@c@month \space
27.78
27.79
       \expandafter\Greeknumeral\expandafter{\the\year}}
```

\noextrasgreek

\extrasgreek The macro \extrasgreek will perform all the extra definitions needed for the Greek language. The macro \noextrasgreek is used to cancel the actions of \extrasgreek. For the moment these macros switch the fontencoding used and the definition of the internal macros \@alph and \@Alph because in Greek we do use the Greek numerals.

```
27.80 \addto\extrasgreek{\greektext}
27.81 \addto\noextrasgreek{\latintext}
```

\gr@ill@value When the argument of \greeknumeral has a value outside of the acceptable bounds (0 < x < 999999) a warning will be issued (and nothing will be printed).

```
27.82 \def\gr@ill@value#1{%
      \PackageWarning{babel}{Illegal value (#1) for greeknumeral}}
```

\anw@false

\anw@true When a a large number with three trailing zero's is to be printed those zeros and the numeric mark need to be discarded. As each 'digit' is processed by a separate macro and because the processing needs to be expandable we need some helper macros that help remember to *not* print the numeric mark (\anwtonos).

> The command \anw@false switches the printing of the numeric mark off by making \anw@print expand to nothing. The command \anw@true (re)enables the printing of the numeric marc. These macro's need to be robust in order to prevent improper expansion during writing to files or during \uppercase.

```
27.84 \DeclareRobustCommand\anw@false{%
      \DeclareRobustCommand\anw@print{}}
27.86 \DeclareRobustCommand\anw@true{%
      \DeclareRobustCommand\anw@print{\anwtonos}}
27.88 \anw@true
```

\greeknumeral

The command \greeknumeral needs to be fully expandable in order to get the right information in auxiliary files. Therefore we use a big \if-construction to check the value of the argument and start the parsing at the right level.

```
27.89 \def\greeknumeral#1{%}
```

If the value is negative or zero nothing is printed and a warning is issued.

```
\ifnum#1<\@ne\space\gr@ill@value{#1}%

27.91
         \ifnum#1<10\expandafter\gr@num@i\number#1%
27.92
27.93
           \ifnum#1<100\expandafter\gr@num@ii\number#1%
27.94
27.95
```

We use the available shorthands for 1.000 (\@m) and 10.000 (\@M) to save a few

```
\ifnum#1<\@m\expandafter\gr@num@iii\number#1%
27.96
27.97
             \else
27.98
               \ifnum#1<\@M\expandafter\gr@num@iv\number#1%
```

```
27 99
                 \else
                    \ifnum#1<100000\expandafter\gr@num@v\number#1%
27.100
27.101
                    \else
27.102
                      \ifnum#1<1000000\expandafter\gr@num@vi\number#1%
27.103
                      \else
   If the value is too large, nothing is printed and a warning is issued.
27 104
                        \space\gr@ill@value{#1}%
27.105
                      \fi
27.106
                   \fi
                 \fi
27.107
               \fi
27.108
27.109
             \fi
27.110
          \fi
27.111
        \fi
27.112 }
```

\Greeknumeral The command \Greeknumeral prints uppercase greek numerals. The parsing is performed by the macro \greeknumeral.

\greek@alph In the previous release of this language definition the commands \greek@aplh and \greek@alph were kept just for reasons of compatibility. Here again they become meaningful macros. They are definited in a way that even page numbering with greek numerals is possible. Since the macros \@alph and \@alph will lose their original meaning while the Greek option is active, we must save their original value. macros \@alph

```
27.115 \let\latin@alph\@alph
27.116 \let\latin@Alph\@Alph
```

Then we define the Greek versions; the additional \expandafters are needed in order to make sure the table of contents will be correct, e.g., when we have appendixes.

```
27.117 \ef\greek@alph#1{\expandafter\greeknumeral\expandafter{\the#1}} \\ 27.118 \ef\greek@alph#1{\expandafter\Greeknumeral\expandafter{\the#1}}
```

Now we can set up the switching.

```
27.119 \addto\extrasgreek{%
27.120 \let\@alph\greek@alph
27.121 \let\@Alph\greek@Alph}
27.122 \addto\noextrasgreek{%
27.123 \let\@alph\latin@alph
27.124 \let\@Alph\latin@Alph}
```

\greek@roman \greek@Roman

To prevent roman numerals being typeset in greek letters we need to adopt the internal LATEX commands \@roman and \@Roman. Note that this may cause errors where roman ends up in a situation where it needs to be expanded; problems are known to exist with the AMS document classes.

```
27.125 \leftlet \atin@roman\end{2} \aligned 27.126 \leftlet \atin@Roman\end{2} \aligned 27.127 \leftlef \greek@roman#1{\left\langle \right\rangle } \aligned 27.128 \leftlef \greek@Roman#1{\left\langle \right\rangle } \aligned 27.129 \addto\extrasgreek{%} \aligned 27.129 \addto\extrasgreek% \addto\extr
```

```
27.130 \let\@roman\greek@roman
27.131 \let\@Roman\greek@Roman}
27.132 \addto\noextrasgreek{%
27.133 \let\@roman\latin@roman
27.134 \let\@Roman\latin@Roman}
mp The greek fonts do not contain
```

\greek@amp The greek fonts do not contain an ampersand, so the LATEX command \& dosn't \ltx@amp give the expected result if we do not do something about it.

```
 27.135 \leftlet\tx@amp\& 27.136 \leftlet\tx@amp\{\textlatin\{\tx@amp\}\} } 27.137 \addto\extrasgreek\{\let\&\tx@amp\} } 27.138 \addto\noextrasgreek\{\let\&\tx@amp\}
```

What is left now is the definition of a set of macros to produce the various digits.

\gr@num@i As there is no representation for 0 in this system the zeros are simply discarded. When we have a large number with three trailing zero's also the numeric mark \gr@num@iii is discarded. Therefore these macros need to pass the information to each other about the (non-)translation of a zero.

```
27.139 \def\gr@num@i#1{%
27.140 \ifcase#1\or a\or b\or g\or d\or e\or \stigma\or z\or h\or j\fi
27.141 \ifnum#1=\z@\else\anw@true\fi\anw@print}
27.142 \def\gr@num@ii#1{%
27.143 \ifcase#1\or i\or k\or 1\or m\or n\or x\or o\or p\or \qoppa\fi
27.144 \ifnum#1=\z@\else\anw@true\fi\gr@num@i}
27.145 \def\gr@num@ii#1{%
27.146 \ifcase#1\or r\or sv\or t\or u\or f\or q\or y\or w\or \sampi\fi
27.147 \ifnum#1=\z@\anw@false\else\anw@true\fi\gr@num@ii}
```

\gr@num@iv The first three 'digits' always have the numeric mark, except when one is discarded because it's value is zero.

```

               \gr@num@v}
```

\greek@tilde In greek typesetting we need a number of characters with more than one accent. In the underlying family of fonts (the cb fonts) this is solved using Knuth's ligature mechanism. Characters we need to have ligatures with are the tilde, the acute and grave accent characters, the rough and smooth breathings, the subscript, and the double quote character. In text input the ~ is normaly used to produce an unbreakable space. The command \~ normally produces a tilde accent. For polytonic Greek we change the definition of \~ to produce the tilde character itself, making sure it has category code 12.

```
27.160 \begingroup
27.161 \Gifundefined{active@char\string!}{\catcode'!=12\relax}
27.162 \catcode'\='\^
27.163 \lccode'\!='\^
27.164 \lowercase{\def\x{\endgroup}}
27.165 \def\greek@tilde{!}}\x}
27.166 \addto\extraspolutonikogreek{%}
27.167 \babel@save\~\let\~\greek@tilde}
```

In order to get correct hyphenation we need to set the lower case code of a number of characters. The 'v' character has a special usage for the cb fonts: in fact this ligature mechanism detects the end of a word and assures that a final sigma is typeset with the proper sign wich is different from that of an initial or medial sigma; the 'v 'after an *isolated* sigma fools the ligature mechanism in order to typeset  $\sigma$  in place of  $\varsigma$ . Because of this we make sure its lowercase code is not changed. For "modern" greek we have to deal only with ' and " and so things are easy.

```
27.168 \addto\extrasgreek{%
       \babel@savevariable{\lccode'v}\lccode'v='v\%
27.169
       \babel@savevariable{\lccode'\';}\lccode'\';='\',%
       \babel@savevariable{\lccode'\"}\lccode'\"='\"}
27.171
27.172 \addto\extraspolutonikogreek{%
       \babel@savevariable{\lccode'\<}\lccode'\<='\<%
27.173
       \babel@savevariable{\lccode'\>}\lccode'\>='\>%
27.174
       \babel@savevariable{\lccode'\~}\lccode'\~='\~%
27.175
       \babel@savevariable{\lccode'\|}\lccode'\|='\\%
27.176
27 177
       \babel@savevariable{\lccode'\'}\lccode'\'='\'}
```

And in order to get rid of all accents and breathings when a string is \uppercased we also change a number of uppercase codes.

```
27.178 \addto\extrasgreek{%
27.179 \babel@savevariable{\uccode'\"}\uccode'\"='\"%
27.180 \babel@savevariable{\uccode'\'}\uccode'\'=159} %% 159 == ^^9f
27.181 \addto\extraspolutonikogreek{%
27.182 \babel@savevariable{\uccode'\~}\uccode'\~=159%
27.183 \babel@savevariable{\uccode'\>}\uccode'\>=159%
27.184 \babel@savevariable{\uccode'\}\uccode'\<=159%
27.185 \babel@savevariable{\uccode'\|}\uccode'\|='\|%
27.186 \babel@savevariable{\uccode'\'}\uccode'\'=159}
```

For this to work we make the character  $^9f$  a shorthand that expands to nothing. In order for this to work we need to make a character look like  $^9f$  in  $T_EX$ 's eyes. The trick is to have another character and assign it a different lowercase code. The execute the macros needed in a \lowercase environment. Usually the tile  $^c$  character is used for such purposes. Before we do this we save it's original lowercase code to restore it once we're done.

```
27.187 \@tempcnta=\lccode'\~

27.188 \lccode'\~=159

27.189 \lowercase{%

27.190 \initiate@active@char{~}%

27.191 \declare@shorthand{greek}{~}{}}

27.192 \lccode'\~=\@tempcnta
```

We can also make the tilde character itself expand to a tilde with category code 12 to make the typing of texts easier.

```
27.193 \verb| addto| extraspolutonikogreek{ \languageshorthands{greek}} \\ 27.194 \verb| \declare@shorthand{greek}{^}{\qreek@tilde}
```

We now define a few symbols which are used in the type setting of greek numerals, as well as some other symbols which are usefull, such as the  $\epsilon v \rho \omega$  symbol, etc.

```
27.195 \DeclareTextCommand{\anwtonos}{LGR}{\char"FE\relax}
27.196 \DeclareTextCommand{\katwtonos}{LGR}{\char"FF\relax}
27.197 \DeclareTextCommand{\qoppa}{LGR}{\char"12\relax}
27.198 \DeclareTextCommand{\stigma}{LGR}{\char"06\relax}
27.199 \DeclareTextCommand{\stigma}{LGR}{\char"06\relax}
27.200 \DeclareTextCommand{\Digamma}{LGR}{\char"C3\relax}
27.201 \DeclareTextCommand{\ddigamma}{LGR}{\char"93\relax}
27.202 \DeclareTextCommand{\vardigamma}{LGR}{\char"07\relax}
27.203 \DeclareTextCommand{\euro}{LGR}{\char"18\relax}
27.204 \DeclareTextCommand{\permill}{LGR}{\char"19\relax}
```

Since the ~ cannot be used to produce an unbreakable white space we must redefine at least the commands \fnum@figure and \fnum@table so they do not produce a ~ instead of white space.

```
27.205 \label{lem:condition} $$27.206 \label{lem:condition}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
27.207 \ldf@finish{\CurrentOption} 27.208 \langle /code \rangle
```

# 28 The French language

The file frenchb.dtx<sup>24</sup>, defines all the language definition macros for the French language.

Customisation for the French language is achieved following the book "Lexique des règles typographiques en usage à l'Imprimerie nationale" troisième édition (1994), ISBN-2-11-081075-0.

First version released: 1.1 (1996/05/31) as part of babel-3.6beta.

frenchb has been improved using helpful suggestions from many people, mainly from Jacques André, Michel Bovani, Thierry Bouche, and Vincent Jalby. Thanks to all of them!

This new version (2.x) has been designed to be used with  $\LaTeX$  2 $\varepsilon$  and PlainTEX formats only.  $\LaTeX$  2.09 is no longer supported. Changes between version 1.6 and ? are listed in subsection 28.4 p. 125.

An extensive documentation is available in French here:

http://daniel.flipo.free.fr/frenchb

#### 28.1 Basic interface

In a multilingual document, some typographic rules are language dependent, i.e. spaces before 'double punctuation' (:;!?) in French, others concern the general layout (i.e. layout of lists, footnotes, indentation of first paragraphs of sections) and should apply to the whole document.

Starting with version 2.2, frenchb behaves differently according to babel's main language defined as the last option<sup>25</sup> at babel's loading. When French is not babel's main language, frenchb no longer alters the global layout of the document (even in parts where French is the current language): the layout of lists, footnotes, indentation of first paragraphs of sections are not customised by frenchb.

When French is loaded as the last option of babel, frenchb makes the following changes to the global layout, both in French and in all other languages<sup>26</sup>:

- 1. the first paragraph of each section is indented (LATEX only);
- 2. the default items in itemize environment are set to '-' instead of '•', and all vertical spacing and glue is deleted; it is possible to change '-' to something else ('--' for instance) using \frenchbsetup{};
- 3. vertical spacing in general LATEX lists is shortened;
- 4. footnotes are displayed "à la française".

Regarding local typography, the command \selectlanguage{french} switches to the French language<sup>27</sup>, with the following effects:

1. French hyphenation patterns are made active;

 $<sup>^{24}</sup>$ The file described in this section has version number? and was last revised on?.

 $<sup>^{25} \</sup>mathrm{Its}$  name is kept in **\bbl@main@language**.

<sup>&</sup>lt;sup>26</sup>For each item, hooks are provided to reset standard LATEX settings or to emulate the behavior of former versions of frenchb (see command \frenchbsetup{}, section 28.2).

<sup>&</sup>lt;sup>27</sup>\selectlanguage{francais} and \selectlanguage{frenchb} are kept for backward compatibility but should no longer be used.

- 2. 'double punctuation' (: ; !?) is made active<sup>28</sup> for correct spacing in French;
- 3. \today prints the date in French;
- 4. the caption names are translated into French (IATEX only);
- 5. the space after \dots is removed in French.

Some commands are provided in frenchb to make typesetting easier:

- 1. French quotation marks can be entered using the commands  $\log$  and fg which work in  $E^TEX 2_{\varepsilon}$  and  $F^TEX 2_{\varepsilon}$ , their appearance depending on what is available to draw them; even if you use  $E^TEX 2_{\varepsilon}$  and  $T^T-encoding$ , you should refrain from entering them as <<  $F^T-ench$  quotation  $F^T-ench$  quotation  $F^T-ench$  quotation be used outside  $F^T-ench$ , they typeset then English quotes "and".
- 2. A command \up is provided to typeset superscripts like M\up{me} (abbreviation for "Madame"), 1\up{er} (for "premier"). Other commands are also provided for ordinals: \ier, \iere, \iere, \iere, \ieme, \ieme, \iemes (3\iemes prints 3es).
- 3. Family names should be typeset in small capitals and never be hyphenated, the macro \bsc (boxed small caps) does this, e.g., Leslie~\bsc{Lamport} will produce Leslie LAMPORT. Note that composed names (such as Dupont-Durant) may now be hyphenated on explicit hyphens, this differs from frenchb v.1.x.
- 4. Commands \primo, \secundo, \tertio and \quarto print 1°, 2°, 3°, 4°. \FrenchEnumerate{6} prints 6°.
- 5. Abbreviations for "Numéro(s)" and "numéro(s)" (No Nos no and nos ) are obtained via the commands  $\No, \Nos, \no, \nos.$
- 6. Two commands are provided to typeset the symbol for "degré": \degre prints the raw character and \degres should be used to typeset temperatures (e.g., "20~\degres C" with an unbreakable space), or for alcohols' strengths (e.g., "45\degres" with no space in French).
- 7. In math mode the comma has to be surrounded with braces to avoid a spurious space being inserted after it, in decimal numbers for instance (see the TeXbook p. 134). The command \DecimalMathComma makes the comma be an ordinary character in French only (no space added); as a counterpart, if \DecimalMathComma is active, an explicit space has to be added in lists and intervals: \$[0,\ 1]\$, \$(x,\ y)\$. \StandardMathComma switches back to the standard behaviour of the comma.
- 8. A command \nombre was provided in 1.x versions to easily format numbers in slices of three digits separated either by a comma in English or with a space in French; \nombre is now mapped to \numprint from numprint.sty, see numprint.pdf for more information.

 $<sup>^{28}\!\:\</sup>mathrm{Actually},$  they are active in the whole document, only their expansions differ in French and outside French

9. frenchb has been designed to take advantage of the xspace package if present: adding \usepackage{xspace} in the preamble will force macros like \fg, \ier, \ieme, \dots, ..., to respect the spaces you type after them, for instance typing '1\ier juin' will print '1er juin' (no need for a forced space after 1\ier).

#### 28.2 Customisation

Up to version 1.6, customisation of frenchb was achieved by entering commands in frenchb.cfg. This possibility remains for compatibility, but should not longer be used. Version 2.0 introduces a new command \frenchbsetup{} using the keyval syntax which should make it easier to choose among the many options available. The command \frenchbsetup{} is to appear in the preamble only (after loading babel)

\frenchbsetup{ShowOptions} prints all available options to the .log file, it is just meant as a remainder of the list of offered options. As usual with keyval syntax, boolean options (as ShowOptions) can be entered as ShowOptions=true or just ShowOptions, the '=true' part can be omitted.

The other options are listed below. Their default value is shown between brackets, sometimes followed be a '\*'. The '\*' means that the default shown applies when frenchb is loaded as the *last* option of babel—babel's main language—, and is toggled otherwise:

- StandardLayout=true [false\*] forces frenchb not to interfere with the layout: no action on any kind of lists, first paragraphs of sections are not indented (as in English), no action on footnotes. This option replaces the former command \StandardLayout. It can be used to avoid conflicts with classes or packages which customise lists or footnotes.
- GlobalLayoutFrench=false [true\*] can be used, when French is the main language, to emulate what prior versions of frenchb (pre-2.2) did: lists, and first paragraphs of sections will be displayed the standard way in other languages than French, and "à la française" in French. Note that the layout of footnotes is language independent anyway (see below FrenchFootnotes and AutoSpaceFootnotes). This option replaces the former command \FrenchLayout.
- ReduceListSpacing=false [true\*]; frenchb normally reduces the values of the vertical spaces used in the environment list in French; setting this option to false reverts to the standard settings of list. This option replaces the former command \FrenchListSpacingfalse.
- CompactItemize=false [true\*]; frenchb normally suppresses any vertical space between items of itemize lists in French; setting this option to false reverts to the standard settings of itemize lists. This option replaces the former command \FrenchItemizeSpacingfalse.
- StandardItemLabels=true [false\*] when set to true this option stops frenchb from changing the labels in itemize lists in French.

- ItemLabels=\textemdash, \textbullet, \ding{43},..., [\textendash\*]; when StandardItemLabels=false (the default), this option enables to choose the label used in itemize lists for all levels. The next three options do the same but each one for one level only. Note that the example \ding{43} requires \usepackage{pifont}.
- ItemLabeli=\textemdash, \textbullet, \ding{43}, ..., [\textendash\*]
- ItemLabelii=\textemdash, \textbullet, \ding{43}, ..., [\textendash\*]
- ItemLabeliii=\textemdash, \textbullet, \ding{43}, ..., [\textendash\*]
- ItemLabeliv=\textemdash, \textbullet, \ding{43}, ..., [\textendash\*]
- StandardLists=true [false\*] forbids frenchb to customise any kind of list. Do activate the option StandardLists when using classes or packages that customise lists too (enumitem, paralist, ...) to avoid conflicts. This option is just a shorthand for ReduceListSpacing=false and CompactItemize=false and StandardItemLabels=true.
- IndentFirst=false [true\*]; frenchb normally forces indentation of the first paragraph of sections. When this option is set to false, the first paragraph of will look the same in French and in English (not indented).
- FrenchFootnotes=false [true\*] reverts to the standard layout of footnotes. By default frenchb typesets leading numbers as '1. ' instead of '1', but has no effect on footnotes numbered with symbols (as in the \tanks command). The former commands \StandardFootnotes and \FrenchFootnotes are still there, \StandardFootnotes can be useful when some footnotes are numbered with letters (inside minipages for instance).
- AutoSpaceFootnotes=false [true\*]; by default frenchb adds a thin space in the running text before the number or symbol calling the footnote. Making this option false reverts to the standard setting (no space added).
- FrenchSuperscripts=false [true]; then \up=\textsuperscript (option added in version 2.1). Should only be made false to recompile older documents. By default \up now relies on \fup designed to produce better looking superscripts.
- AutoSpacePunctuation=false [true]; in French, the user should input a space before the four characters ':;!?' but as many people forget about it (even among native French writers!), the default behaviour of frenchb is to automatically add a \thinspace before ';' '!' '?' and a normal (unbreakable) space before ':' (recommended by the French Imprimerie nationale). This is convenient in most cases but can lead to addition of spurious spaces in URLs or in MS-DOS paths. Choosing AutoSpacePunctuation=false will ensure that a proper space will be added before ':;!?' if and only if a (normal) space has been typed in. Those who are unsure about their typing in this area should stick to the default option and type \string; \string: \string: \string? instead of; :!? whenever no space should be added before them (mostly in URLs and MS-DOS paths).

- ThinColonSpace=true [false] changes the normal (unbreakable) space added before the colon ':' to a thin space, so that the same amount of space is added before any of the four double punctuation characters. The default setting is supported by the French Imprimerie nationale.
- LowercaseSuperscripts=false [true]; by default frenchb inhibits the uppercasing of superscripts (for instance when they are moved to page headers). Making this option false will disable this behaviour (not recommended).
- PartNameFull=false [true]; when true, frenchb numbers the title of \part{} commands as "Première partie", "Deuxième partie" and so on. With some classes which change the \part{} command (AMS and SMF classes do so), you will get "Première partie I", "Deuxième partie II" instead; when this occurs, this option should be set to false, part titles will then be printed as "Partie I", "Partie II".
- og=«, fg=»; when guillemets characters are available on the keyboard (through a compose key for instance), it is nice to use them instead of typing \og and \fg. This option tells frenchb which characters are opening and closing French guillemets (they depend on the input encoding), then you can type either « guillemets », or «guillemets» (with or without spaces), to get properly typeset French quotes. This option requires inputenc to be loaded with the proper encoding, it works with 8-bits encodings (latin1, latin9, ansinew, applemac,...) and multi-byte encodings (utf8 and utf8x).

## 28.3 Hyphenation checks

Once you have built your format, a good precaution would be to perform some basic tests about hyphenation in French. For  $\LaTeX$  I suggest this:

• run the following file, with the encoding suitable for your machine (my-encoding will be latin1 for UNIX machines, ansinew for PCs running Windows, applemac or latin1 for Macintoshs, or utf8...

```
%%% Test file for French hyphenation.
\documentclass{article}
\usepackage[my-encoding]{inputenc}
\usepackage[T1]{fontenc} % Use LM fonts
\usepackage{lmodern} % for French
\usepackage[frenchb]{babel}
\begin{document}
\showhyphens{signal container \'ev\'enement alg\'ebre}
\showhyphens{signal container événement algèbre}
\end{document}
```

• check the hyphenations proposed by TEX in your log-file; in French you should get with both 7-bit and 8-bit encodings si-gnal contai-ner évé-ne-ment al-gèbre.

Do not care about how accented characters are displayed in the log-file, what matters is the position of the '-' hyphen signs *only*.

If they are all correct, your installation (probably) works fine, if one (or more) is (are) wrong, ask a local wizard to see what's going wrong and perform the test again (or e-mail me about what happens).

Frequent mismatches:

- you get sig-nal con-tainer, this probably means that the hyphenation patterns you are using are for US-English, not for French;
- you get no hyphen at all in évé-ne-ment, this probably means that you are using CM fonts and the macro \accent to produce accented characters. Using 8-bits fonts with built-in accented characters avoids this kind of mismatch.

Options' order - Please remember that options are read in the order they appear inside the \frenchbsetup command. Someone wishing that frenchb leaves the layout of lists and footnotes untouched but caring for indentation of first paragraph of sections could choose \frenchbsetup{StandardLayout,IndentFirst} and get the expected layout. Choosing \frenchbsetup{IndentFirst,StandardLayout} would not lead to the expected result: option IndentFirst would be overwritten by StandardLayout.

## 28.4 Changes

#### What's new in version 2.0?

Here is the list of all changes:

- Support for L<sup>A</sup>T<sub>E</sub>X-2.09 and for L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> in compatibility mode has been dropped. This version is meant for L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> and Plain based formats (like bplain). L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> formats based on mlT<sub>E</sub>X are no longer supported either (plenty of good 8-bits fonts are available now, so T1 encoding should be preferred for typesetting in French). A warning is issued when OT1 encoding is in use at the \begin{document}.
- Customisation should now be handled by command \frenchbsetup{}, frenchb.cfg (kept for compatibility) should no longer be used. See section 28.2 for the list of available options.
- Captions in figures and table have changed in French: former abbreviations "Fig." and "Tab." have been replaced by full names "Figure" and "Table". If this leads to formatting problems in captions, you can add the following two commands to your preamble (after loading babel) to get the former captions \addto\captionsfrench{\def\figurename{{\scshape Fig.}}}\addto\captionsfrench{\def\tablename{{\scshape Tab.}}}.
- The \nombre command is now provided by the numprint package which has to be loaded *after* babel with the option autolanguage if number formatting should depend on the current language.
- The \bsc command no longer uses an \hbox to stop hyphenation of names but a \kern0pt instead. This change enables microtype to fine tune the length of the argument of \bsc; as a side-effect, compound names like Dupont-Durand can now be hyphenated on explicit hyphens. You can get back to the former behaviour of \bsc by adding

\renewcommand\*{\bsc}[1]{\leavevmode\hbox{\scshape #1}}
to the preamble of your document.

• Footnotes are now displayed "à la française" for the whole document, except with an explicit

\frenchbsetup{AutoSpaceFootnotes=false,FrenchFootnotes=false}. Add this command if you want standard footnotes. It is still possible to revert locally to the standard layout of footnotes by adding \StandardFootnotes (inside a minipage environment for instance).

#### What's new in version 2.1?

New command \fup to typeset better looking superscripts. Former command \up is now defined as \fup, but an option \frenchbsetup{FrenchSuperscripts=false} is provided for backward compatibility. \fup was designed using ideas from Jacques André, Thierry Bouche and René Fritz, thanks to them!

#### What's new in version 2.2?

Starting with version 2.2a, frenchb alters the layout of lists, footnotes, and the indentation of first paragraphs of sections) only if French is the "main language" (i.e. babel's last language option). The layout is global for the whole document: lists, etc. look the same in French and in other languages, everything is typeset "à la française" if French is the "main language", otherwise frenchb doesn't change anything regarding lists, footnotes, and indentation of paragraphs.

## 28.5 File frenchb.cfg

frenchb.cfg is now a dummy file just kept for compatibility with previous versions.

## 29 T<sub>E</sub>Xnical details

## 29.1 Initial setup

While this file was read through the option frenchb we make it behave as if french was specified.

#### 29.1 \def\CurrentOption{french}

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

 $29.2 \LdfInit\CurrentOption\datefrench$ 

\ifLaTeXe No support is provided for late LATeX-2.09: issue a warning and exit if LATeX-2.09 is in use. Plain is still supported.

29 27
         \fi
29.28
       \else
29.29
29.30
         \let\l@french\l@francais
29.31
29.32 \fi
```

Now \logrench is always defined.

The internal name for the French language is french; francais and frenchb are synonymous for french: first let both names use the same hyphenation patterns. Later we will have to set aliases for \captionsfrench, \datefrench, \extrasfrench and \noextrasfrench. As French uses the standard values of \lefthyphenmin (2) and \righthyphenmin (3), no special setting is required here.

```
29.33 \ifx\l@francais\@undefined
29.34 \let\l@francais\l@french
29.35 \fi
29.36 \ifx\l@frenchb\@undefined
29.37 \let\l@frenchb\l@french
29.38 \fi
```

When this language definition file was loaded for one of the Canadian versions of French we need to make sure that a suitable hyphenation pattern register will be

```
found by T<sub>F</sub>X.
29.39 \ifx\l@canadien\@undefined
29.40 \let\l@canadien\l@french
29.41 \fi
29.42 ifx\l@acadian\eggundefined
29.43 \let\l@acadian\l@french
29.44 \fi
```

This language definition can be loaded for different variants of the French language. The 'key' babel macros are only defined once, using 'french' as the language name, but frenchb and francais are synonymous.

```
29.45 \def\datefrancais{\datefrench}
29.46 \def\defrenchb{\datefrench}
29.47 \def\extrasfrancais{\extrasfrench}
29.48 \def\extrasfrenchb{\extrasfrench}
29.49 \def\noextrasfrancais{\noextrasfrench}
29.50 \def\noextrasfrenchb{\noextrasfrench}
```

\noextrasfrench

\extrasfrench The macro \extrasfrench will perform all the extra definitions needed for the French language. The macro \noextrasfrench is used to cancel the actions of \extrasfrench.

> In French, character "apostrophe" is a letter in expressions like l'ambulance (French hyphenation patterns provide entries for this kind of words). This means that the \lccode of "apostrophe" has to be non null in French for proper hyphenation of those expressions, and has to be reset to null when exiting French.

```
29.51 \@namedef{extras\CurrentOption}{\lccode'\';='\';}
29.52 \@namedef{noextras\CurrentOption}{\lccode'\'=0}
```

One more thing \extrasfrench needs to do is to make sure that \frenchspacing is in effect. \noextrasfrench will switch \frenchspacing off again.

```
29.53
      \expandafter\addto\csname extras\CurrentOption\endcsname{%
         \bbl@frenchspacing}
29.54
29.55
      \expandafter\addto\csname noextras\CurrentOption\endcsname{%
        \bbl@nonfrenchspacing}
29.56
```

#### 29.2 Punctuation

As long as no better solution is available <sup>29</sup>, the 'double punctuation' characters (; ! ? and :) have to be made \active for an automatic control of the amount of space to insert before them. Before doing so, we have to save the standard definition of \@makecaption (which includes two ':') to compare it later to its definition at the \begin{document}.

```
29.57 \long\def\STD@makecaption#1#2{%
       \vskip\abovecaptionskip
29.58
       \sbox\@tempboxa{#1: #2}%
29.59
       \ifdim \wd\@tempboxa >\hsize
29.60
         #1: #2\par
29.61
       \else
29.62
         \global \@minipagefalse
29.63
29.64
         \hb@xt@\hsize{\hfil\box\@tempboxa\hfil}%
```

<sup>&</sup>lt;sup>29</sup>LuaT<sub>E</sub>X, or pdfT<sub>E</sub>X might provide alternatives in the future...

```
29.65 \fi
29.66 \vskip\belowcaptionskip}%
```

We define a new 'if' \FBpunct@active which will be made false whenever a better alternative will be available. The following code makes the four characters; ! ? and : 'active' and provides their definitions.

```
29.67 \newif\iffBpunctQactive \FBpunctQactivetrue
29.68 \iffBpunctQactive
29.69 \initiateQactiveQchar{:}
29.70 \initiateQactiveQchar{;}
29.71 \initiateQactiveQchar{!}
29.72 \initiateQactiveQchar{?}
```

We first tune the amount of space before; ! ? and :. This should only happen in horizontal mode, hence the test \ifhmode.

In horizontal mode, if a space has been typed before ';' we remove it and put an unbreakable \thinspace instead. If no space has been typed, we add \FDP@thinspace which will be defined, up to the user's wishes, as an automatic added thin space, or as \@empty.

```
29.73
       \declare@shorthand{french}{;}{%
29.74
           \ifhmode
            \ifdim\lastskip>\z@
29.75
29.76
                \unskip\penalty\@M\thinspace
                \else
29.77
29.78
                  \FDP@thinspace
              \fi
29.79
           \fi
29.80
  Now we can insert a; character.
29.81
           \string;}
  The next three definitions are very similar.
29.82
       \declare@shorthand{french}{!}{%
29.83
            \ifhmode
              \ifdim\lastskip>\z@
29.84
                \unskip\penalty\@M\thinspace
29.85
29.86
29.87
                \FDP@thinspace
              \fi
29.88
           \fi
29.89
           \string!}
29.90
       \declare@shorthand{french}{?}{%
29.91
29.92
           \ifhmode
29.93
              \ifdim\lastskip>\z@
29.94
                \unskip\penalty\@M\thinspace
29.95
              \else
                \FDP@thinspace
29.96
29.97
              \fi
           \fi
29.98
29.99
           \string?}
```

According to the I.N. specifications, the ':' requires a normal space before it, but some people prefer a \thinspace (just like the other three). We define \text{Fcolonspace} to hold the required amount of space (user customisable).

```
29.100 \quad \texttt{\new command*{\Fcolonspace}{\space}}
```

```
\declare@shorthand{french}{:}{%
29 101
            \ifhmode
29.102
29.103
               \ifdim\lastskip>\z@
                 \unskip\penalty\@M\Fcolonspace
29.104
29.105
               \else
                 \FDP@colonspace
29.106
               \fi
29.107
            \fi
29.108
29.109
            \string:}
```

\AutoSpaceBeforeFDP \NoAutoSpaceBeforeFDP

\FDP@thinspace and \FDP@space are defined as unbreakable spaces by \AutoSpaceBeforeFDP or as \@empty by \NoAutoSpaceBeforeFDP.

Default is \AutoSpaceBeforeFDP.

When the active characters appear in an environment where their French behaviour is not wanted they should give an 'expected' result. Therefore we define shorthands at system level as well.

```
29.116 \declare@shorthand{system}{:}{\string:}
29.117 \declare@shorthand{system}{!}{\string!}
29.118 \declare@shorthand{system}{?}{\string?}
29.119 \declare@shorthand{system}{;}{\string;}
```

We specify that the French group of shorthands should be used.

```
29.120 \addto\extrasfrench{\%}
29.121 \languageshorthands{french}\%
```

These characters are 'turned on' once, later their definition may vary. Don't misunderstand the following code: they keep being active all along the document, even when leaving French.

```
29.122 \bbl@activate{;}%
29.123 \bbl@activate{!}\bbl@activate{?}%
29.124 }
29.125 \addto\noextrasfrench{%
29.126 \bbl@deactivate{:}\bbl@deactivate{;}%
29.127 \bbl@deactivate{!}\bbl@deactivate{?}}
29.128 \fi
```

## 29.3 French quotation marks

\og The top macros for quotation marks will be called \og ("ouvrez guillemets") and \fg ("fermez guillemets"). Another option for typesetting quotes in multilingual texts is to use the package csquotes.sty and its command \enquote.

```
29.129 \newcommand*{\ng}{\centy} 29.130 \newcommand*{\fg}{\centy}
```

 In both cases the commands \guillemotleft and \guillemotright will print the French opening and closing quote characters from the output font. For XeLaTeX, \guillemotleft and \guillemotright are defined by package xunicode.sty. We will check 'AtBeginDocument' that the proper output encodings are in use (see end of section 29.13).

We give the following definitions for Plain users only as a (poor) fall-back, they are welcome to change them for anything better.

```
29.131 \setminus ifLaTeXe
29.132 \setminus else
29.133
        \ifx\guillemotleft\@undefined
          \def\guillemotleft{\leavevmode\raise0.25ex
29.134
                                \hbox{$\scriptscriptstyle\11$}}
29.135
29.136
        \ifx\guillemotright\@undefined
29 137
           \def\guillemotright{\raise0.25ex
29.138
29.139
                                  \hbox{$\scriptscriptstyle\gg$}}
29.140
29.141
        \let\xspace\relax
29.142 \fi
```

The next step is to provide correct spacing after \guillemotleft and before \guillemotright: a space precedes and follows quotation marks but no line break is allowed neither after the opening one, nor before the closing one. \FBguill@spacing which does the spacing, has been fine tuned by Thierry Bouche. French quotes (including spacing) are printed by \FB@og and \FB@fg, the expansion of the top level commands \og and \og is different in and outside French. We'll try to be smart to users of David Carlisle's xspace package: if this package is loaded there will be no need for \{\} or \ to get a space after \fg, otherwise \xspace will be defined as \relax (done at the end of this file).

```
\label{lem:posterior} $$29.143 \end *{FBguill@spacing}_{\penalty\end hskip.8$ fontdimen2\font $$29.144$ plus.3$ fontdimen3\font $$29.145$ minus.8$ fontdimen4\font} $$29.146 \end *{FB@og}_{\penalty\end hskip.8$ fontdimen4\font} $$29.146 \end *{FB@og}_{\penalty\end hskip.8$ fontdimen4\font} $$29.146 \end *{FB@og}_{\penalty\end hskip.8$ fontdimen4\font} $$29.148 \end here.$$ fill $$29.148 \end here.$$ fill $$29.149$ fill $$
```

The top level definitions for French quotation marks are switched on and off through the \extrasfrench \noextrasfrench mechanism. Outside French, \og and \fg will typeset standard English opening and closing double quotes.

```
29.150 \ifLaTeXe
29.151
        \def\bbl@frenchguillemets{\renewcommand*{\og}{\FB@og}%
                                     \renewcommand*{\fg}{\FB@fg}}
29.152
        \def\bbl@nonfrenchguillemets{\renewcommand*{\og}{\textquotedblleft}}%
29.153
                   \label{lem:lastskip} $$\operatorname{\dim}\astskip}\z@\unskip\fi
29 154
                                             \textquotedblright}}
29.155
29.156 \else
         \def\bbl@frenchguillemets{\let\og\FB@og
29.157
29.158
                                       \left\{ \int g FB0fg \right\}
29.159
         \def\bbl@nonfrenchguillemets{\def\og{''}%
29.160
                             \def\fg{\ifdim\lastskip>\z@\unskip\fi ''}}
29.161 \fi
```

```
29.162 \expandafter\addto\csname extras\CurrentOption\endcsname{% 29.163 \bbl@frenchguillemets}
29.164 \expandafter\addto\csname noextras\CurrentOption\endcsname{% 29.165 \bbl@nonfrenchguillemets}
```

#### 29.4 Date in French

\datefrench The macro \datefrench redefines the command \today to produce French dates.

```
29.166 \@namedef{date\CurrentOption}{%
29.167 \def\today{{\number\day}\ifnum1=\day {\ier}\fi \space
29.168 \ifcase\month
29.169 \or janvier\or f\'evrier\or mars\or avril\or mai\or juin\or
29.170 juillet\or ao\^ut\or septembre\or octobre\or novembre\or
29.171 d\'ecembre\fi
29.172 \space \number\year}}
```

#### 29.5 Extra utilities

Let's provide the French user with some extra utilities.

\up \up eases the typesetting of superscripts like '1er'. Up to version 2.0 of frenchb \up was just a shortcut for \textsuperscript in  $\LaTeX$  Let  $\LaTeX$ , but several users complained that \textsuperscript typesets superscripts too high and too big, so we now define \fup as an attempt to produce better looking superscripts. \up is defined as \fup but can be redefined by \frenchbsetup{FrenchSuperscripts=false} as \textsuperscript for compatibility with previous versions.

When a font has built-in superscripts, the best thing to do is to just use them, otherwise \fup has to simulate superscripts by scaling and raising ordinary letters. Scaling is done using package scalefnt which will be loaded at the end of babel's loading (frenchb being an option of babel, it cannot load a package while being read).

```
29.173 \newif\ifFB@poorman
29.174 \newdimen\FB@Mht
29.175 \ifLaTeXe
29.176 \AtEndOfPackage{\RequirePackage{scalefnt}}
```

\FB@up@fake holds the definition of fake superscripts. The scaling ratio is 0.65, raising is computed to put the top of lower case letters (like 'm') just under the top of upper case letters (like 'M'), precisely 12% down. The chosen settings look correct for most fonts, but can be tuned by the end-user if necessary by changing \FBsupR and \FBsupS commands.

\FB@lc is defined as \lowercase to inhibit the uppercasing of superscripts (this may happen in page headers with the standard classes but is wrong); \FB@lc can be redefined to do nothing by option LowercaseSuperscripts=false of \frenchbsetup{}.

```
 \begin{array}{lll} 29.177 & \mbox{FBsupR}_{-0.12} \\ 29.178 & \mbox{FBsupS}_{0.65} \\ 29.179 & \mbox{FBQlc}_{1]_{\mbox{VBQupQfake}_{1]}_{\%}} \\ 29.180 & \mbox{DeclareRobustCommand*}_{FBQupQfake}_{1]_{\%}_{29.181} \\ & \mbox{settoheight}_{FBQMht}_{\%}_{\%} \\ 29.182 & \mbox{Addtolength}_{FBQMht}_{-FBsupR}_{FBQMht}_{\%}_{29.183} \\ & \mbox{Addtolength}_{FBQMht}_{-FBsupS}_{\%}_{\%} \\ \end{array}
```

```
 $$29.184 \quad \text{FB@Mht}_{\scalefont{FBsupS}_{FB@1c{\#1}}}% $$29.185 $$
```

The only packages I currently know to take advantage of real superscripts are a) xltxtra used in conjunction with XeLaTeX and OpenType fonts having the font feature 'VerticalPosition=Superior' (xltxtra defines \realsuperscript and \fakesuperscript) and b) fourier (from version 1.6) when Expert Utopia fonts are available.

\FB@up checks whether the current font is a Type1 'Expert' (or 'Pro') font with real superscripts or not (the code works currently only with fourier-1.6 but could work with any Expert Type1 font with built-in superscripts, see below), and decides to use real or fake superscripts. It works as follows: the content of \fofamily (family name of the current font) is split by \FB@split into two pieces, the first three characters ('fut' for Fourier, 'ppl' for Adobe's Palatino, ...) stored in \FB@firstthree and the rest stored in \FB@suffix which is expected to be 'x' or 'j' for expert fonts.

Then \FB@up looks for a .fd file named t1fut-sup.fd (Fourier) or t1ppl-sup.fd (Palatino), etc. supposed to define the subfamily (fut-sup or ppl-sup, etc.) giving access to the built-in superscripts. If the .fd file is not found by \IfFileExists, \FB@up falls back on fake superscripts, otherwise \FB@suffix is checked to decide whether to use fake or real superscripts.

```
\edef\reserved@a{\lowercase{%
29.193
29.194
               \noexpand\IfFileExists{\f@encoding\FB@firstthree -sup.fd}}}%
            \reserved@a
29.195
29.196
              {\ifx\FB@suffix\FB@x \FB@poormanfalse\fi
29 197
               \ifx\FB@suffix\FB@j \FB@poormanfalse\fi
29.198
               \ifFB@poorman \FB@up@fake{#1}%
                              \FB@up@real{#1}%
               \else
29 199
               \fi}%
29 200
              {\FB@up@fake{#1}}%
29.201
29 202
```

\FB@up@real just picks up the superscripts from the subfamily (and forces lower-case).

\fup is now defined as \FB@up unless \realsuperscript is defined (occurs with XeLaTeX calling xltxtra.sty).

Temporary definition of up (redefined 'AtBeginDocument').

```
29.210 \quad \text{new command} \{ \text{up} \} \{ \text{relax} \}
```

Poor man's definition of \up for Plain. In  $\LaTeX 2_{\varepsilon}$ , \up will be defined as \fup or \textsuperscript later on while processing the options of \frenchbsetup{}.

```
29.211 \else
       29.212 \newcommand*{\up}[1]{\leavevmode\raise1ex\hbox{\sevenrm #1}}
       29.213 \fi
   \ieme Some handy macros for those who don't know how to abbreviate ordinals:
    \iereg.215 \def\iemes{\up{\lowercase{es}}\xspace}
  \ieme$9.216 \def\ier{\up{\lowercase{er}}\xspace}
  \ierg9.217 \def\iers{\up{\lowercase{ers}}\xspace}
  29.219 \def\ieres{\up{\lowercase{res}}\xspace}
     \No And some more macros relying on \up for numbering, first two support macros.
     \n g_{9.220} \n ewcommand*{\FrenchEnumerate}[1]{%}
    \Nos9.221
                                     #1 \sup{\lceil \log (o) \rceil \setminus \ker (o) \rceil}
    \label{lem:nose2.22} $$ \newcommand*{FrenchPopularEnumerate} [1] {\% }

       29.231 \def\fquarto) {\FrenchPopularEnumerate4}
             Let's provide four macros for the common abbreviations of "Numéro".
       29.232 \label{lowercase} $$29.232 \lowercase{o}}\kern+.2em$
       29.233 \label{lowercase} $$29.233 \end{*{\no}{n\setminus p{\lowercase{o}}}\kern+.2em}$
       29.234 \label{lowercase} $$29.234 \end{*{\Nos}{N\setminus up{\lowercase{os}}} \end{*{\Nos}} $$
       29.235 \verb|\DeclareRobustCommand*{\nos}{n up{\lowercase{os}}\kern+.2em}|
```

\bsc As family names should be written in small capitals and never be hyphenated, we provide a command (its name comes from Boxed Small Caps) to input them easily. Note that this command has changed with version 2 of frenchb: a \kernOpt is used instead of \hbox because \hbox would break microtype's font expansion; as a (positive?) side effect, composed names (such as Dupont-Durand) can now be hyphenated on explicit hyphens. Usage: Jean~\bsc{Duchemin}.

```
29.236 \DeclareRobustCommand*{\bsc}[1]{\leavevmode\begingroup\kern0pt
29.237 \scshape #1\endgroup}
29.238 \ifLaTeXe\else\let\scshape\relax\fi
```

Some definitions for special characters. We won't define \tilde as a Text Symbol not to conflict with the macro \tilde for math mode and use the name \tild instead. Note that \boi may not be used in math mode, its name in math mode is \backslash. \degre can be accessed by the command \r{} for ring accent.

```
29.239 \setminus ifLaTeXe
       \DeclareTextSymbol{\at}{T1}{64}
29.240
        \DeclareTextSymbol{\circonflexe}{T1}{94}
29.241
        \DeclareTextSymbol{\tild}{T1}{126}
29.242
29.243
        \DeclareTextSymbolDefault{\at}{T1}
        \DeclareTextSymbolDefault{\circonflexe}{T1}
29.244
        \DeclareTextSymbolDefault{\tild}{T1}
29.245
        \DeclareRobustCommand*{\boi}{\textbackslash}
29.246
29.247
        \DeclareRobustCommand*{\degre}{\r{}}
29.248 \else
        \texttt{\def}\T@one\{T1\}
29.249

29.251
          \newcommand*{\degre}{\char6}
        \else
29.252
          \newcommand*{\degre}{\char23}
29.253
        \fi
29.254
        \new command *{\at}{\char64}
29.255
        \newcommand*{\circonflexe}{\char94}
29.257
        \newcommand*{\tild}{\char126}
29.258
        \newcommand*{\boi}{$\backslash$}
29.259 \fi
```

\degres We now define a macro \degres for typesetting the abbreviation for 'degrees' (as in 'degrees Celsius'). As the bounding box of the character 'degree' has very different widths in CM/EC and PostScript fonts, we fix the width of the bounding box of \degres to 0.3 em, this lets the symbol 'degree' stick to the preceding (e.g., 45\degres) or following character (e.g., 20~\degres C).

If the  $T_EX$  Companion fonts are available (textcomp.sty), we pick up \textdegree from them instead of using emulating 'degrees' from the \r{} accent. Otherwise we overwrite the (poor) definition of \textdegree given in latin1.def, applemac.def etc. (called by inputenc.sty) by our definition of \degrees. We also advice the user (once only) to use TS1-encoding.

## 29.6 Formatting numbers

\DecimalMathComma \StandardMathComma As mentioned in the  $T_EX$ book p. 134, the comma is of type \mathpunct in math mode: it is automatically followed by a space. This is convenient in lists and intervals but unpleasant when the comma is used as a decimal separator in French: it has to be entered as  $\{,\}$ . \DecimalMathComma makes the comma be an ordinary character (of type \mathbb{mathord}) in French only (no space added); \StandardMathComma switches back to the standard behaviour of the comma.

```
29.282 \newcount\std@mcc
29.283 \newcount\dec@mcc

nombre The command \nombre is now borrowed from numprint.sty for  $\LaTeX$  TeX  $2_{\varepsilon}$ . There is no point to maintain the former tricky code when a package is dedicated to do the same job and more. For Plain based formats, \nombre no longer formats numbers, it prints them as is and issues a warning about the change.

Fake command \nombre for Plain based formats, warning users of frenchb v.1.x. of the change.

The next definitions only make sense for  $\LaTeX 2_{\mathcal{E}}$ . Let's cleanup and exit if the format in Plain based.

```
29.299 \let\FBstop@here\relax

\CaptionSeparator

Let's consider now captions in figures and tables. In French, captions in figures and tables should be printed with endash ('-') instead of the standard ':'.

The standard definition of <code>\@makecaption</code> (e.g., the one provided in article.cls, report.cls, book.cls which is frozen for LATEX  $2_{\varepsilon}$  according to Frank Mittelbach), has been saved in <code>\STD@makecaption</code> before making ':' active (see section 29.2). 'AtBeginDocument' we compare it to its current definition (some classes like koma-script classes, AMS classes, ua-thesis.cls...change it). If they are identical, frenchb just adds a hook called <code>\CaptionSeparator</code> to <code>\@makecaption</code>, <code>\CaptionSeparator</code> defaults to ': ' as in the standard <code>\@makecaption</code>, and will be changed to ' – ' in French. If the definitions differ, frenchb doesn't overwrite the changes, but prints a message in the .log file.

```

#### 29.8 French lists

\listFB \listORI Vertical spacing in general lists should be shorter in French texts than the defaults provided by LATEX. Note that the easy way, just changing values of vertical spacing parameters when entering French and restoring them to their defaults on exit would not work; as most lists are based on \list we will define a variant of \list(\listFB) to be used in French.

The amount of vertical space before and after a list is given by \topsep + \parskip (+ \partopsep if the list starts a new paragraph). IMHO, \parskip should be added *only* when the list starts a new paragraph, so I subtract \parskip from \topsep and add it back to \partopsep; this will normally make no difference because \parskip's default value is 0pt, but will be noticeable when \parskip is not null.

\endlist is not redefined, but \endlistORI is provided for the users who prefer to define their own lists from the original command, they can code: \begin{listORI}{} \end{listORI}.

```
29.412 \let\listORI\list
29.413 \let\endlistORI\endlist
29.414 \def\FB@listsettings{%
29.415 \setlength{\itemsep}{0.4ex plus 0.2ex minus 0.2ex}%
29.416 \setlength{\parsep}{0.4ex plus 0.2ex minus 0.2ex}%
29.417 \setlength{\topsep}{0.8ex plus 0.4ex minus 0.4ex}%
29.418 \setlength{\partopsep}{0.4ex plus 0.2ex minus 0.2ex}%
```

\parskip is of type 'skip', its mean value only (not the glue) should be subtracted from \topsep and added to \partopsep, so convert \parskip to a 'dimen' using \@tempdima.

```
\label{lem:pdima} $$ 29.419 $$ \addtolength{\topsep}_{-\Delta^* } $$ 29.421 $$ \addtolength{\partopsep}_{\Delta^* } $$ 29.422 \def\listFB#1#2{\listORI{#1}_{FB@listsettings} $$ $$ $$ 29.423 \let\endlistFB\endlist} $$
```

\itemizeFB \itemizeORI \bbl@frenchlabelitems \bbl@nonfrenchlabelitems Let's now consider French itemize lists. They differ from those provided by the standard  $\LaTeX$  2 $\varepsilon$  classes:

- vertical spacing between items, before and after the list, should be *null* with *no glue* added;
- the item labels of a first level list should be vertically aligned on the paragraph's first character (i.e. at \parindent from the left margin);
- the '•' is never used in French itemize-lists, a long dash '-' is preferred for all levels. The item label used in French is stored in \FrenchLabelItem}, it defaults to '-' and can be changed using \frenchbsetup{} (see section 29.13).

```
29.424 \newcommand*{\FrenchLabelItem} {\textendash} \\ 29.425 \newcommand*{\Frlabelitemi}{\FrenchLabelItem} \\ 29.426 \newcommand*{\Frlabelitemii}{\FrenchLabelItem} \\ 29.427 \newcommand*{\Frlabelitemiii}{\FrenchLabelItem} \\ 29.428 \newcommand*{\Frlabelitemiv}{\FrenchLabelItem} \\ \newcommand*{\Frlabelitemiv}{\FrenchLabelItem} \\ \newcommand*{\Frlabelitemiv}} \\ \newcommand*{\Frlabelitemiv} \\ \newcommand*{\Frlabelitemiv}} \\ \newcommand*{\Frlabeli
```

\bbl@frenchlabelitems saves current itemize labels and changes them to their value in French. This code should never be executed twice in a row, so we need a new flag that will be set and reset by \bbl@nonfrenchlabelitems and \bbl@frenchlabelitems.

```

\parskip is of type 'skip', its mean value only (not the glue) should be subtracted from \topsep and added to \partopsep, so convert \parskip to a 'dimen' using \Qtempdima.

The user's changes in labelitems are saved when leaving French for further use when switching back to French. This code should never be executed twice in a row (toggle with \bbl@frenchlabelitems).

#### 29.9 French indentation of sections

\bbl@frenchindent In French the first paragraph of each section should be indented, this is another \bbl@nonfrenchindent difference with US-English.

```
29.483 \let\@aifORI\@afterindentfalse \\ 29.484 \def\bbl\@frenchindent{\let\@afterindentfalse\@aifterindenttrue} \\ 29.485 \@afterindenttrue \\ 29.486 \def\bbl\@nonfrenchindent{\let\@afterindentfalse\@aiftoRI} \\ 29.487 \end{pigns}
```

## 29.10 Formatting footnotes

The bigfoot package deeply changes the way footnotes are handled. When bigfoot is loaded, we just warn the user that frenchb will drop the customisation of footnotes.

The layout of footnotes is controlled by two flags \iffBAutoSpaceFootnotes and \iffBFrenchFootnotes which are set by options of \frenchbsetup{} (see section 29.13). Notice that the layout of footnotes does not depend on the current language (just think of two footnotes on the same page looking different because one was called in a French part, the other one in English!).

When \iffBAutoSpaceFootnotes is true, \@footnotemark (whose definition is saved at the \begin{document} in order to include any customisation that packages might have done) is redefined to add a thin space before the number or symbol calling a footnote (any space typed in is removed first). This has no effect on the layout of the footnote itself.

```
29.488 \land AtBeginDocument{\Qifpackageloaded{bigfoot}}
                            {\PackageWarning{frenchb.ldf}%
29.489
                               {bigfoot package in use.\MessageBreak

                              \fi}%
29.499
```

We then define \@makefntextFB, a variant of \@makefntext which is responsible for the layout of footnotes, to match the specifications of the French 'Imprimerie Nationale': footnotes will be indented by \parindentFFN, numbers (if any) typeset on the baseline (instead of superscripts) and followed by a dot and an half quad space. Whenever symbols are used to number footnotes (as in \tanks for instance), we switch back to the standard layout (the French layout of footnotes is meant for footnotes numbered by Arabic or Roman digits).

The value of \parindentFFN will be redefined at the \begin{document}, as the maximum of \parindent and 1.5em unless it has been set in the preamble (the weird value 10in is just for testing whether \parindentFFN has been set or not).

```
29.500 \newdimen\parindentFFN

For compatibility reasons, we provide definitions for the commands dealing with the layout of footnotes in frenchb version 1.6. \frenchbsetup{} (see in section 29.13) should be preferred for setting these options. \StandardFootnotes may still be used locally (in minipages for instance), that's why the test \ifFBFrenchFootnotes is done inside \@makefntext.

```
29.528 \newcommand*{\AddThinSpaceBeforeFootnotes}{\FBAutoSpaceFootnotestrue} \\ 29.529 \newcommand*{\FrenchFootnotes}{\FBFrenchFootnotestrue} \\ 29.530 \newcommand*{\StandardFootnotes}{\FBFrenchFootnotesfalse}
```

## 29.11 Global layout

In multilingual documents, some typographic rules must depend on the current language (e.g., hyphenation, typesetting of numbers, spacing before double punctuation...), others should, IMHO, be kept global to the document: especially the layout of lists (see 29.8) and footnotes (see 29.10), and the indentation of the first paragraph of sections (see 29.9).

From version 2.2 on, if frenchb is babel's "main language" (i.e. last language option at babel's loading), frenchb customises the layout (i.e. lists, indentation of the first paragraphs of sections and footnotes) in the whole document regardless the current language. On the other hand, if frenchb is *not* babel's "main language", it leaves the layout unchanged both in French and in other languages.

\FrenchLayout The former commands \FrenchLayout and \StandardLayout are kept for com-\StandardLayout patibility reasons but should no longer be used.

```
29.531 \newcommand*{\FrenchLayout}{%
          \FBGlobalLayoutFrenchtrue

29.549 \@onlypreamble\StandardLayout
```

#### 29.12 Dots...

**\FBtextellipsis** 

IATEX  $2\varepsilon$ 's standard definition of \dots in text-mode is \textellipsis which includes a \kern at the end; this space is not wanted in some cases (before a closing brace for instance) and \kern breaks hyphenation of the next word. We define \FBtextellipsis for French (in IATEX  $2\varepsilon$  only).

The \if construction in the  $\LaTeX$   $2_{\varepsilon}$  definition of \dots doesn't allow the use of xspace (xspace is always followed by a \fi), so we use the AMS- $\LaTeX$  construction of \dots; this has to be done 'AtBeginDocument' not to be overwritten when amsmath.sty is loaded after babel.

LY1 has a ready made character for \textellipsis, it should be used in French too (pointed out by Bruno Voisin).

```
 29.550 \ensuremath{\color=133} \\ 29.551 \ensuremath{\color=133} \\ 29.552 \ensuremath{\color=133} \\ \ensuremath{\color=1333} \\ \ensuremath{\color=1333} \\ \ensuremath{\color=13333} \\ \ensuremath{\c
```

\Mdots@ and \Tdots@ORI hold the definitions of \dots in Math and Text mode. They default to those of amsmath-2.0, and will revert to standard LATEX definitions 'AtBeginDocument', if amsmath has not been loaded. \Mdots@ doesn't change when switching from/to French, while \Tdots@ is \FBtextellipsis in French and \Tdots@ORI otherwise.

```

29.582 \newif\ifFBShowOptions
```

The defaults values of these flags have been set so that frenchb does not change anything regarding the global layout. \bbl@main@language (set by the last option of babel) controls the global layout of the document. We check the current language 'AtEndOfPackage' (it is \bbl@main@language); if it is French, the values of some flags have to be changed to ensure a French looking layout for the whole document (even in parts written in languages other than French); the end-user will then be able to customise the values of all these flags with \frenchbsetup{}.

```

29.592 }
```

\frenchbsetup From version 2.0 on, all setup options are handled by *one* command \frenchbsetup using the keyval syntax. Let's now define this command which reads and sets the options to be processed later (at \begin{document}) by \FBprocess@options. It can only be called in the preamble.

```
29.593 \newcommand*{\frenchbsetup}[1]{% 29.594 \setkeys{FB}{#1}% 29.595 }% 29.596 \@onlypreamble\frenchbsetup
```

frenchb being an option of babel, it cannot load a package (keyval) while frenchb.ldf is read, so we defer the loading of keyval and the options setup at the end of babel's loading.

StandardLayout resets the layout in French to the standard layout defined par the LATEX class and packages loaded. It deals with lists, indentation of first paragraphs of sections and footnotes. Other keys, entered after StandardLayout in \frenchbsetup, can overrule some of the StandardLayout settings.

GlobalLayoutFrench forces the layout in French and (as far as possible) outside French to meet the French typographic standards.

```

Inputing French quotes as single characters when they are available on the keyboard (through a compose key for instance) is more comfortable than typing \og and \fg. The purpose of the following code is to map the French quote characters to \og\ignorespaces and {\fg} respectively when the current language is French, and to \guillemotleft and \guillemotright otherwise (think of German quotes); thus correct unbreakable spaces will be added automatically to French quotes. The quote characters typed in depend on the input encoding, it can be single-byte (latin1, latin9, applemac,...) or multi-bytes (utf-8, utf8x). We first check whether XeTeX is used or not, if not the package inputenc has to be loaded before the \begin{document} with the proper coding option, so we check if \DeclareInputText is defined.

```

```

When true, ThinSpaceInFrenchNumbers redefines numprint.sty's command \npstylefrench to set \npthousandsep to \, (thinspace) instead of ~ (default). This option has no effect if package numprint.sty is not loaded with 'autolanguage'. As old versions of numprint.sty did not define \npstylefrench, we have to provide this command.

### 29.14 Clean up and exit

Load frenchb.cfg (should do nothing, just for compatibility).

Final cleaning. The macro \ldfQquit takes care for setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value. The config file searched for has to be frenchb.cfg, and \CurrentOption has been set to 'french', so \ldfQfinish\CurrentOption cannot be used: we first load frenchb.cfg, then call \ldfQquit\CurrentOption.

```
29.923 \FBclean@on@exit
29.924 \ldf@quit\CurrentOption
```

## 30 The Italian language

The file  $italian.dtx^{30}$  defines all the language-specific macros for the Italian language.

The features of this language definition file are the following:

- 1. The Italian hyphenation is invoked, provided that file ithyph.tex was loaded when the  $\LaTeX$   $2\varepsilon$  format was built; in case it was not, read the information coming with your distribution of the  $\TeX$  software, and the babel documentation.
- 2. The language dependent fixed words to be inserted by such commands as \chapter, \caption, \tableofcontents, etc. are redefined in accordance with the Italian typographical practice.
- 3. Since Italian can be easily hyphenated and Italian practice allows to break a word before the last two letters, hyphenation parameters have been set accordingly, but a very high demerit value has been set in order to avoid word breaks in the penultimate line of a paragraph. Specifically the \clubpenalty, and the \widowpenalty are set to rather high values and \finalhyphendemerits is set to such a high value that hyphenation is prohibited between the last two lines of a paragraph. In orer to make it consistent, also \@clubpenalty is set to the same value; actualy the latter value is the reset value after every sectioning command, so that after the first section, \clubpenalty is reset to the low default value. Thanks to Enrico Gregorio for spotting this serious bug.
- 4. Some language specific shortcuts have been defined so as to allow etymological hyphenation, specifically " inserts a break point in any word boundary that the typesetter chooses, provided it is not followed by and accented letter (very unlikely in Italian, where compulsory accents fall only on the last and ending vowel of a word, but may take place with compound words that include foreign roots), and "| when the desired break point falls before an accented letter.
- 5. The shortcut "" introduces the raised (English) opening double quotes; this shortcut proves its usefulness when one reminds that the Italian keyboard misses the backtick key, and the backtick on a Windows based platform may be obtained only by pressing the Alt key while inputting the numerical code 0096; very, very annoying!
- 6. The shortcuts "< and "> insert the French guillemots, sometimes used in Italian typography; with the T1 font encoding the ligatures << and >> should insert such signs directly, but not all the virtual fonts that claim to follow the T1 font encoding actually contain the guillemots; with the OT1 encoding the guillemots are not available and must be faked in some way. By using the "< and "> shortcuts (even with the T1 encoding) the necessary tests are performed and in case the suitable glyphs are taken from other fonts normally available with any good, modern LATEX distribution.

<sup>&</sup>lt;sup>30</sup>The file described in this section has version number v1.2t and was last revised on 2008/03/14. The original author is Maurizio Codogno, (mau@beatles.cselt.stet.it). It has been largely revised by Johannes Braams and Claudio Beccari

7. Three new specific commands \unit, \ped, and \ap are introduced so as to enable the correct composition of technical mathematics according to the ISO 31/XI recommendations. \unit does not get redefined if the babel package is loaded after the package units.sty whose homonymous command plays a different role and follows a different syntax.

For this language a limited number of shortcuts has been defined, table 6, some of which are used to overcome certain limitations of the Italian keyboard; in section 30.3 there are other comments and hints in order to overcome some other keyboard limitations.

- " inserts a compound word mark where hyphenation is legal; it allows etymological hyphenation which is recommended for technical terms, chemical names and the like; it does not work if the next character is represented with a control sequence or is an accented character.
- " | the same as the above without the limitation on characters represented with control sequences or accented ones.
- "" inserts open quotes ".
- "< inserts open guillemots.
- "> inserts closed guillemots.
- "/ equivalent to \slash

Table 6: Shortcuts for the Italian language

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
30.1 (*code)
30.2 \LdfInit{italian}{captionsitalian}%
```

When this file is read as an option, i.e. by the \usepackage command, italian will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lambda@italian to see whether we have to do something here.

```
30.3 \ifx\l@italian\@undefined
30.4 \@nopatterns{Italian}%
30.5 \adddialect\l@italian0\fi
```

The next step consists of defining commands to switch to (and from) the Italian language.

\captionsitalian The macro \captionsitalian defines all strings used in the four standard document classes provided with LATEX.

#### 30.1 Support for etymological hyphenation

In his article on Italian hyphenation [1] Beccari pointed out that the Italian language gets hyphenated on a phonetic basis, although etymological hyphenation is allowed; this is in contrast with what happens in Latin, for example, where etymological hyphenation is always used. Since the patterns for both languages would become too complicated in order to cope with etymological hyphenation, in his paper Beccari proposed the definition of an active character '\_' such that it could insert a "soft" discretionary hyphen at the compound word boundary. For several reasons that idea and the specific active character proved to be unpractical and was abandoned.

This problem is so important with the majority of the European languages, that babel from the very beginning developed the tradition of making the " character active so as to perform several actions that turned useful with every language. One of these actions consisted in defining the shortcut "| that was extensively used in German and in many other languages in order to insert a discretionary hyphen such that hyphenation would not be precluded in the rest of the word as it happens with the standard  $T_{\rm E}X$  command  $\-$ .

Meanwhile the ec fonts with the double Cork encoding (thus formerly called the dc fonts) have become more or less standard and are widely used by virtually all Europeans that write languages with many special national characters; by so doing they avoid the use of the \accent primitive which would be required with the standard cm fonts; with the latter fonts the primitive command \accent is such that hyphenation becomes almost impossible, in any case strongly impeached.

The ec fonts contain a special character, named "compound word mark", that occupies position 23 in the font scheme and may be input with the sequence ^~W. Up to now, apparently, this special character has never been used in a practical way for the typesetting of languages rich of compound words; also it has never been inserted in the hyphenation pattern files of any language. Beccari modified his pattern file ithyph.tex v4.8b for Italian so as to contain five new patterns that involve ^~W, and he tried to give the babel active character " a new shortcut definition, so as to allow the insertion of the "compound word mark" in the proper place within any word where two semantic fragments join up. With such facility for marking the compound word boundaries, etymological hyphenation becomes possible even if the patterns know nothing about etymology (but the typesetter hopefully does!). In Italian such etymological hyphenation is desirable with technical terms, chemical names, and the like.

Even this solution proved to be inconvenient on certain UN\*X platforms, so Beccari resorted to another approach that uses the babel active character " and relies on the category code of the character that follows ".

```
30.47 \initiate@active@char{"}%
30.48 \addto\extrasitalian{\bbl@activate{"}\languageshorthands{italian}}%
```

\it@cwm The active character " is now defined for language italian so as to perform different actions in math mode compared to text mode; specifically in math mode a double quote is inserted so as to produce a double prime sign, while in text mode the temporary macro \it@next is defined so as to defer any further action until the next token category code has been tested.

```
30.49 \end{areQshorthand{italian}{"}{\%} \\ 30.50 \end{areQshorthand{italian}{"}{\%} \\ 30.51 \end{areQshorthand{italian}{"}{\%} \\ 30.51 \end{areQshorthand{italian}{"}{\%} \\ 30.52 \end{areQshorthand{italian}{"}{\%} \\ 30.53 \end{area} \end{area} \end{area} \end{area} \end{area} \end{area} \end{area}
```

```
30.55 \it@next
30.56 }%
```

30.83 \it@@next}%

The \it@next service control sequence is such that upon its execution a temporary variable \it@temp is made equivalent to the next token in the input list without actually removing it. Such temporary token is then tested by the macro \it@cwm and if it is found to be a letter token, then it introduces a compound word separator control sequence \it@allowhyphens whose expansion introduces a discretionary hyphen and an unbreakable space; in case the token is not a letter, then it is tested against |<sub>12</sub>: if so a compound word separator is inserted and the | token is removed, otherwise another test is performed so as to see if another double quote sign follows: in this case a double open quote mark is inserted, otherwise two other tests are performed so as to see if guillemets have to be inserted, otherwise

equivalent to "for inserting raised open high double quotes.

nothing is done. The double quote shortcut for inserting a double open quote sign is useful for people who are inputting Italian text by means of an Italian keyboard that unfortunately misses the grave or backtick key. By this shortcut "" becomes

 $30.57 \det it@@cwm{\nobreak\discretionary{-}{}{}\nobreak\hskip\z@skip}%$  $30.58 \end{area} $$ 30.58 \end{area} $$ \end{area} $$ it@@ccap$1{\it@ccap}% $$ $$ it@eccap$1.$  $30.59 \verb|\DeclareRobustCommand*{\lit@cwm}{\lit@cwm}{\lit@cwm} = t ext | ext |$ 30.60 \ifcat\noexpand\it@temp a% \def\it@@next{\it@@cwm}% 30.61  $30.62 \ensuremath{\setminus} else$ 30.63 \if\noexpand\it@temp \string|% \def\it@@next{\it@@cwm\@gobble}% 30.64 30.65 \if\noexpand\it@temp \string<% 30.66 \def\it@@next{\it@@ocap}% 30.67 30.68 \if\noexpand\it@temp \string>% 30.69 \def\it@@next{\it@@ccap}% 30.70 30.71 \if\noexpand\it@temp\string/% 30.72 30.73 \def\it@@next{\slash\@gobble}% \else 30.74 \ifx\it@temp"% 30.75 \def\it@@next{''\@gobble}% 30.76 \fi 30.77 \fi 30.78 \fi 30.79 \fi 30.80 \fi 30.81 30.82 \fi

By this definition of " if one types macro"istruzione the possible break points become ma-cro-istru-zio-ne, while without the " mark they would be ma-cro-istru-zio-ne, according to the phonetic rules such that the macro prefix is not taken as a unit. A chemical name such as des"clor"fenir"amina"cloridrato is breakable as des-clor-fe-nir-ami-na-clo-ri-dra-to instead of de-sclor-fe-ni-ra-mi-na-...

In other language description files a shortcut is defined so as to allow a break point without actually inserting any hyphen sign; examples are given such as entrada/salida; actually if one wants to allow a breakpoint after the slash, it is much clearer to type \slash instead of / and LATEX does everything by itself; here the shortcut "/ was introduced to stand for \slash so that one can type input"/output and allow a line break after the slash. This shortcut works only for the slash, since in Italian such constructs are extremely rare.

Attention: the expansion of "takes place before the actual expansion of OT1 or T1 accented sequences such as \'{a}; therefore this etymological hyphenation facility works as it should only when the semantic word fragments do not start with an accented letter; this in Italian is always avoidable, because compulsory accents fall only on the last vowel, but it may be necessary to mark a compound word where one or more components come from a foreign language and contain diacritical marks according to the spelling rules of that language. In this case the special shorthand "| may be used that performs exactly as " normally does, except that the | sign is removed from the token input list: kilo"|{\"o}rsted gets hyphenated as ki-lo-\"or-sted.

### 30.2 Facilities required by the ISO 31/XI regulations

The ISO 31/XI regulations require that units of measure are typeset in upright font in any circumstance, math or text, and that in text mode they are separated from the numerical indication of the measure with an unbreakable (thin) space. The command \unit that was defined for achieving this goal happened to conflict with the homonymous command defined by the package units.sty; we therefore need to test if that package has already been loaded so as to avoid conflicts; we assume that if the user loads that package, s/he wants to use that package facilities and command syntax.

The same regulations require also that super and subscripts (apices and pedices) are in upright font, not in math italics, when they represent "adjectives" or appositions to mathematical or physical variables that do not represent countable or measurable entities such as, for example,  $V_{\text{max}}$  or  $V_{\text{rms}}$  for a maximum or a root mean square voltage, compared to  $V_i$  or  $V_T$  as the *i*-th voltage in a set, or a voltage that depends on the thermodynamic temperature T. See [2] for a complete description of the ISO regulations in connection with typesetting.

More rarely it happens to use superscripts that are not mathematical variables, such as the notation  $\mathbf{A}^T$  to denote the transpose of matrix  $\mathbf{A}$ ; text superscripts are useful also as ordinals or in old fashioned abbreviations in text mode; for example the feminine ordinal  $1^a$  or the old fashioned obsolete abbreviation  $\mathbf{F}^{lli}$  for Fratelli in company names (compare with "Bros." for <u>bro</u>thers in American English); text subscripts are mostly used in logos.

\unit First we define the new (internal) commands \bbl@unit, \bbl@ap, and \bbl@ped \ap as robust ones.

Then we can use \let to define the user level commands, but in case the macros already have a different meaning before entering in Italian mode typesetting, we first memorize their meaning so as to restore them on exit.

```
30.93 \@ifpackageloaded{units}{}{%
30.94 \addto\extrasitalian{%
30.95 \babel@save\unit\let\unit\bbl@unit}%
30.96 }%
30.97 \addto\extrasitalian{%
30.98 \babel@save\ap\let\ap\bbl@ap
30.99 \babel@save\ped\let\ped\bbl@ped
30.100 }%
```

#### 30.3 Accents

Most of the other language description files introduce a number of shortcuts for inserting accents and other language specific diacritical marks in a more comfortable way compared with the lengthy standard TEX conventions. When an Italian keyboard is being used on a Windows based platform, it exhibits such limitations that up to now no convenient shortcuts have been developed; the reason lies in the fact that the Italian keyboard lacks the grave accent (also known as "backtick"), which is compulsory on all accented vowels except the 'e', but, on the opposite, it carries the keys with all the accented lowercase vowels; the keyboard lacks also the tie ~ (tilde) key, while the curly braces require pressing three keys simultaneously.

The best solution Italians have found so far is to use a smart editor that accepts shortcut definitions such that, for example, by striking "( one gets directly { on the screen and the same sign is saved into the .tex file; the same smart editor should be capable of translating the accented characters into the standard  $T_EX$  sequences when writing a file to disk (for the sake of file portability), and to transform the standard  $T_EX$  sequences into the corresponding signs when loading a .tex file from disk to memory. Such smart editors do exist and can be downloaded from the CTAN archives.

For what concerns the missing backtick key, which is used also for inputting the open quotes, it must be noticed that the shortcut "" described above completely solves the problem for *double* raised open quotes; according to the traditions of particular publishing houses, since there are no compulsory regulations on the matter, the French guillemets may be used; in this case the T1 font encoding solves the problem by means of its built in ligatures << and >>. But...

### 30.4 Caporali or French double quotes

Although the T1 font encoding ligatures solve the problem, there are some circumstances where even the T1 font encoding cannot be used, either because the author/typesetter wants to use the OT1 encoding, or because s/he uses a font set that does not comply completely with the T1 font encoding; some virtual fonts, for example, are supposed to implement the double Cork font encoding but actually miss some glyphs; one such virtual font set is given by the ae virtual fonts, because they are supposed to implement such double font encoding simply using the cm fonts, of which the type 1 PostScript version exists and is freely available. Since guillemets (in Italian caporali) do not exist in any cm latin font, their glyphs must be substituted with something else that approaches them.

Since in French typesetting guillemets are compulsory, the French language definition file resorts to a clever font substitution; such file exploits the  $\LaTeX$ font selection machinery so as to get the guillemets from the Cyrillic fonts, because it suffices to locally change the default encoding. There are several sets of Cyrillic fonts, but the ones that obey the OT2 font encoding are generally distributed with all recent implementations of the T<sub>F</sub>X software; they are part of the American Mathematical Society fonts and come both as METAFONT source files and Type 1 PostScript .pfb files. The availability of such fonts should be guaranteed by the presence of the OT2cmr.fd font description file. Actually the presence of this file does not guarantee the completeness of your  $T_EX$  implementation; should  $I^AT_EX$ complain about a missing Cyrillic .tfm file (that kind of file that contains the font metric parameters) and/or about missing Cyrillic (.mf) files, then your T<sub>F</sub>X system is incomplete and you should download such fonts from the CTAN archives. Temporarily you may issue the command \LtxSymbCaporali so as to approximate the missing glyphs with the LATEX symbol fonts. In some case warning messages are issued so as to inform the typesetter about the necessity of resorting to some poor man solution.

In spite of these alternate fonts, we must avoid invoking unusual fonts if the available encoding allows to use built in caporali. As far as I know (CB) the only T1-encoded font families that miss the guillemets are the AE ones; we therefore first test if the default encoding id the T1 one and in this case if the AE families are the default ones; in order for this to work properly it is necessary to load these optional packages *before* babel. If the T1 encoding is not the default one when the Italian language is specified, then some substitutions must be done.

\LtxSymbCaporali \it@ocap \it@ccap We define some macros for substituting the default guillemets; first the emulation by means of the LATEX symbols; each one of these macro sets actually redefines the control sequences \it@ocap and \it@ccap that are the ones effectively activated by the shortcuts "< and ">.

```
30.101 \def\LtxSymbCaporali{%
30.102 \DeclareRobustCommand*{\it@ocap}{\mbox{%
30.103 \fontencoding{U}\fontfamily{lasy}\selectfont(\kern-0.20em()%
30.104 \ignorespaces}%
30.105 \DeclareRobustCommand*{\it@ccap}{\ifdim\lastskip>\z@\unskip\fi
30.106 \mbox{%
30.107 \fontencoding{U}\fontfamily{lasy}\selectfont)\kern-0.20em)}}%
```

Then the substitution with any specific font that contains such glyphs; it might be the CBgreek fonts, the Cyrillic one, the super-cm ones, the lm ones, or any other the user might prefer (the code is adapted from the one that appears in the frenchb.ld file; thanks to Daniel Flipo). By default if the user did not select the T1 encoding, the existence of the CBgreek fonts is tested; if they exist the guillemets are taken from this font, and since its families are a superset of the default CM ones and they apply also to typeset slides with the standard class slides. If the CBgreek fonts are not found, then the existence of the Cyrillic ones is tested, although this choice is not suited for typesetting slides; otherwise the poor man solution of the LATEX special symbols is used. In any case the user can force the use of the Cyrillic guillemets substitution by issuing the declaration \CyrillicCaporali just before the \begin{document} statement; in alternative the user can specify with

```
\label{lem:caporaliFrom} $$ \operatorname{cencoding} {\langle family \rangle} {\langle opening\ number \rangle} {\langle closing\ number \rangle} $$
```

the encoding and family of the font s/he prefers, and the slot numbers of the opening and closing guillemets respectively. For example if the T1-encoded Latin Modern fonts are desired the specific command should be

```
\CaporaliFrom{T1}{lmr}{19}{20}
```

These user choices might be necessary for assuring the correct typesetting with fonts that contain the required glyphs and are available also in PostScript form so as to use them directly with pdflatex, for example.

```

## 31 The Latin language

The file latin.dtx<sup>31</sup> defines all the language-specific macros for the Latin language both in modern and medieval spelling.

For this language the \clubpenalty, \widowpenalty are set to rather high values and \finalhyphendemerits is set to such a high value that hyphenation is prohibited between the last two lines of a paragraph.

For this language two "styles" of typesetting are implemented: "regular" or modern-spelling Latin, and medieval Latin. The medieval Latin specific commands can be activated by means of the language attribute medieval; the medieval spelling differs from the modern one by the systematic use of the lower case 'u' also where in modern spelling the letter 'v' is used; when typesetting with capital letters, on the opposite, the letter 'V' is used also in place of 'U'. Medieval spelling also includes the ligatures ae (æ), e (æ), AE (Æ), and e that are not used in modern spelling, nor were used in the classical times.

Furthermore a third typesetting style withprosodicmarks is defined in order to use special shortcuts for inserting breves and macrons when typesetting grammars, dictionaries, teaching texts, and the like, where prosodic marks are important for the complete information on the words or the verses. The shortcuts, listed in table 7 and described in section 32, may interfere with other packages; therefore by default this third style is off and no interference is introduced. If this third style is used and interference is experienced, there are special commands for turning on and off the specific short hand commands of this style.

For what concerns babel and typesetting with LATEX, the differences between the two styles of spelling reveal themselves in the strings used to name for example the "Preface" that becomes "Praefatio" or "Præfatio" respectively. Hyphenation rules are also different, but the hyphenation pattern file lahyph.tex takes care of both versions of the language. Needless to say that such patterns must be loaded in the LATEX format by running initex (or whatever the name if the initializer) on latex.ltx.

The name strings for chapters, figures, tables, etcetera, are suggested by prof. Raffaella Tabacco, a classicist of the University of Turin, Italy, to whom we address our warmest thanks. The names suggested by Krzysztof Konrad Żelechowski, when different, are used as the names for the medieval variety, since he made a word and spelling choice more suited for this variety.

For this language some shortcuts are defined according to table 7; all of them are supposed to work with both spelling styles, except where the opposite is explicitly stated.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

31.1 (\*code)

#### 31.2 \Ldf Init{latin}{captionslatin}

When this file is read as an option, i.e. by the \usepackage command, latin will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lambda@latin to see whether we have to do something here.

### $31.3 \ifx\l@latin\@undefined$

<sup>31</sup>The file described in this section has version number v2.0k and was last revised on 2008/03/21. The original author is Claudio Beccari with contributions by Krzysztof Konrad Żelechowski, (kkz@alfa.mimuw.edu.pl)

- inserts the breve accent as ĭ; valid also for the other lowercase vowels, but it does not operate on the medieval ligatures æ and œ.
- =a inserts the macron accent as ā; valid also for the other lowercase vowels, but it does not operate on the medieval ligatures æ and œ.
- " inserts a compound word mark where hyphenation is legal; the next character must not be a medieval ligature æ or œ, nor an accented letter (foreign names).
- "| same as above, but operates also when the next character is a medieval ligature or an accented letter.

Table 7: Shortcuts defined for the Latin language. The characters ^ and = are active only when the language attribute withprosodicmarks has been declared, otherwise they are disabled; see section 32 for more details.

```
\Onopatterns{Latin}
31.4
31.5
         \adddialect\l@latin0\fi
     Now we declare the medieval language attribute.
31.6 \bbl@declare@ttribute{latin}{medieval}{%
       \verb|\addto\captions| at in {\def\prefacename{Pr{\ae}fatio}}|,
       \def\november{Nouembris}%

31.37
31.38
      }
```

In the above definitions there are some points that might change in the future or that require a minimum of attention from the typesetter.

- 1. the \enclname is translated by a passive verb, that literally means "(they) are being added"; if just one enclosure is joined to the document, the plural passive is not suited any more; nevertheless a generic plural passive might be incorrect but suited for most circumstances. On the opposite "Additur", the corresponding singular passive, might be more correct with one enclosure and less suited in general: what about the abbreviation "Add." that works in both cases, but certainly is less elegant?
- 2. The \headtoname is empty and gobbles the possible following space; in practice the typesetter should use the dative of the recipient's name; since nowadays not all such names can be translated into Latin, they might result indeclinable. The clever use of an appellative by the typesetter such as "Domino" or "Dominae" might solve the problem, but the header might get too impressive. The typesetter must make a decision on his own.
- 3. The same holds true for the copy recipient's name in the "Cc" field of \ccname.

The macro \datelatin redefines the command \today to produce Latin dates; the choice of faked small caps Latin numerals is arbitrary and may be changed in the future. For medieval latin the spelling of 'Novembris' should be Novembris. This is taken care of by using a control sequence which can be redefined when the attribute 'medieval' is selected.

```

```

Thomas Martin Widmann (viralbus@daimi.au.dk) developed a macro originally named \latindate (but to be renamed \romandate so as not to conflict with the standard babel conventions) that should compute and translate the current date into a date ab urbe condita with days numbered according to the kalendae and idus;

for the moment this is a placeholder for Thomas' macro, waiting for a self standing one that keeps local all the intermediate data, counters, etc. If he succeeds, here is the place to add his macro.

The Latin hyphenation patterns can be used with both \lefthyphenmin and \latinhyphenmins \righthyphenmin set to 2.

31.48 \providehyphenmins{\CurrentOption}{\tw0\tw0}

\extraslatin Lower the chance that clubs or widows occur.

 $\noextraslatin_{31.49} \addto\extraslatin{%}$ 

- \babel@savevariable\clubpenalty 31.50
- \babel@savevariable\@clubpenalty 31.51
- 31.52 \babel@savevariable\widowpenalty
- $\verb|\clubpenalty3000@clubpenalty3000| widowpenalty3000| \\$ 31.53

Never ever break a word between the last two lines of a paragraph in latin texts.

- 31.54 \addto\extraslatin{%
- \babel@savevariable\finalhyphendemerits
- 31.56 \finalhyphendemerits50000000}

With medieval Latin we need the suitable correspondence between upper case V and lower case u, since in that spelling there is only one sign, and the u shape is the (uncial) version of the capital V. Everything else is identical with Latin.

- 31.57 \addto\extrasmedievallatin{% \babel@savevariable{\lccode'\V}% 31.58
- \babel@savevariable{\uccode'\u}% 31.59
- \lccode'\V='\u \uccode'\u='\V} 31.60

\SetLatinLigatures

We need also the lccodes for æ and æ; since they occupy different positions in the OT1 TeX-fontencoding compared to the T1 one, we must save the lc- and the uccodes for both encodings, but we specify the new lc- and uccodes separately as it appears natural not to change encoding while typesetting the same language. The encoding is assumed to be set before starting to use the Latin language, so that if Latin is the default language, the font encoding must be chosen before requiring the babel package with the latin option, in any case before any \selectlanguage or \foreignlanguage command.

All this fuss is made in order to allow the use of the medieval ligatures æ and œ while typesetting with the medieval spelling; I have my doubts that the medieval spelling should be used at all in modern books, reports, and the like; the uncial 'u' shape of the lower case 'v' and the above ligatures were fancy styles of the copyists who were able to write faster with those rounded glyphs; with typesetting there is no question of handling a quill penn... Since my (CB) opinion may be wrong, I managed to set up the instruments and it is up to the typesetter to use them or not.

```

With the above definitions we are sure that \MakeUppercase works properly and \MakeUppercase{C{\ae}sar} correctly 'yields 'CÆSAR"; correspondingly \MakeUppercase{Heluetia} correctly yields "HELVETIA".

#### 32 Latin shortcuts

For writing dictionaries or didactic texts (in modern spelling only) we defined a third language attribute, or a third typesetting style, a couple of other active characters are defined: ^ for marking a vowel with the breve sign, and = for marking a vowel with the macro sign. Please take notice that neither the OT1 font encoding, nor the T1 one for most vowels, contain directly the marked vowels, therefore hyphenation of words containing these "accents" may become problematic; for this reason the above active characters not only introduce the required accent, but also an unbreakable zero skip that in practice does not introduce a discretionary break, but allows breaks in the rest of the word.

It must be remarked that the active characters ^ and = may have other meanings in other contexts. For example the equals sign is used by the graphic extensions for specifying keyword options for handling the graphic elements to be included in the document. At the same time, as mentioned in the previous paragraph, diacritical marking in Latin is used only for typesetting certain kind of documents, such as grammars and dictionaries. It is reasonable that the breve and macron active characters are switched on and off at will, and in particular that they are off by default if the attribute withprosodicmarks has not been set.

\ProsodicMarksOn \ProsodicMarksOff We begin by adding to the normal typesetting style the definitions of the new commands \ProsodicMarksOn and \ProsodicMarksOff that should produce error messages when the third style is not declared:

```
32.1 \addto\extraslatin{\def\ProsodicMarksOn{%}
32.2 \GenericError{(latin)\@spaces\@spaces\@spaces\%}
32.3 {Latin language error: \string\ProsodicMarksOn\space}
32.4 is defined by setting the\MessageBreak
```

```
language attribute to 'withprosodicmarks'\MessageBreak
32.6 If you continue you are likely to encounter\MessageBreak
32.7 fatal errors that I can't recover}%
32.8 {See the Latin language description in the babel
32.9 documentation for explanation}{\Qehd}}}
32.10 \addto\extraslatin{\let\ProsodicMarksOff\relax}
```

Then we temporarily set the caret and the equals sign to active characters so that they can receive their definitions. But first we store their current category codes to restore them later on.

```
32.11 \@tempcnta=\catcode '\= 32.12 \@tempcntb=\catcode '\^ 32.13 \catcode '\= \active 32.14 \catcode '\^ \active
```

Now we can add the necessary declarations to the macros that are being activated when the Latin language and its typesetting styles are declared:

```
32.15 \addto\extraslatin{\languageshorthands{latin}}\% \\ 32.16 \addto\extraswithprosodicmarks{\bbl@activate{^}}\% \\ 32.17 \addto\extraswithprosodicmarks{\bbl@activate{=}}\% \\ 32.18 \addto\noextraswithprosodicmarks{\bbl@deactivate{^}}\% \\ 32.19 \addto\noextraswithprosodicmarks{\bbl@deactivate{=}}\% \\ 32.20 \addto\extraswithprosodicmarks{\ProsodicMarks}
```

\ProsodicMarks Next we define the defining macro for the active characters

```
32.21 \def\ProsodicMarks{%
32.22 \def\ProsodicMarksOn{\catcode'\^ \active\catcode'\= \active}%
32.23 \def\ProsodicMarksOff{\catcode'\^ 7\catcode'\= 12\relax}%
```

Notice that with the above redefinitions of the commands \ProsodicMarksOn and \ProsodicMarksOff, the operation of the newly defined shortcuts may be switched on and off at will, so that even if a picture has to be inserted in the document by means of the commands and keyword options of the graphicx package, it suffices to switch them off before invoking the picture including command, and switched on again afterwards; or, even better, since the picture very likely is being inserted within a figure environment, it suffices to switch them off within the environment, being conscious that their deactivation remains local to the environment.

```
32.24
       \initiate@active@char{^}%
32.25
       \initiate@active@char{=}%
       \declare@shorthand{latin}{^a}{%
32.26
         \textormath{\u\{a\}\bbl@allowhyphens}{\hat\{a\}}}%
32.27
32.28
       \declare@shorthand{latin}{^e}{%
         \textormath{\u\{e\}\bbl@allowhyphens}{\hat\{e\}}}\%
32 29
       \declare@shorthand{latin}{^i}{%

32.34
       \declare@shorthand{latin}{^u}{%
         \textormath{\u\{u\}\bbl@allowhyphens}{\hat\{u\}}}%
32.35
32.36 %
32.37
       \declare@shorthand{latin}{=a}{%
32.38
         \textormath{=a}\bbl@allowhyphens}{\bar{a}}}
32.39
       \declare@shorthand{latin}{=e}{%
         \textormath{\ef{bll}allowhyphens}{\bar{e}}}\%
32.40
```

```
\label{eq:continuous} $$32.41 \declare@shorthand{latin}{=i}{% }$$32.42 \textormath{={i}\bbl@allowhyphens}{\bar{\imath}}}% $$32.43 \declare@shorthand{latin}{=o}{% }$$$32.44 \textormath{={o}\bbl@allowhyphens}{\bar{o}}}% $$$32.45 \declare@shorthand{latin}{=u}{% }$$$$$$$$32.46 \textormath{={u}\bbl@allowhyphens}{\bar{u}}% $$$32.47$$$}
```

Notice that the short hand definitions are given only for lower case letters; it would not be difficult to extend the set of definitions to upper case letters, but it appears of very little use in view of the kind of documents where prosodic marks are supposed to be used. Nevertheless in those rare cases when it's required to set some uppercase letters with their prosodic marks, it is always possible to use the standard LATEX commands such as  $\text{U}\{I\}$  for typesetting  $\check{I}$ , or LA for typesetting  $\check{A}$ .

Finally we restore the caret and equals sign initial default category codes.

```
32.48 \catcode '\= \@tempcnta
32.49 \catcode '\^ \@tempcntb
```

so as to avoid conflicts with other packages or other babel options.

\LatinMarksOn We define two new commands so as to switch on and off the breve and macron \LatinMarksOff shortcuts.

```
32.50 \ \texttt{Addto} \ \texttt{extraswithprosodicmarks} \\ \{\texttt{LatinMarks0n} \ \texttt{ProsodicMarks0ff} \} \\ 32.51 \ \texttt{Addto} \ \texttt{extraswithprosodicmarks} \\ \{\texttt{LatinMarks0ff} \ \texttt{ProsodicMarks0ff} \} \\ \}
```

It must be understood that by using the above prosodic marks, line breaking is somewhat impeached; since such prosodic marks are used almost exclusively in dictionaries, grammars, and poems (only in school textbooks), this shouldn't be of any importance for what concerns the quality of typesetting.

# 33 Etymological hyphenation

In order to deal in a clean way with prefixes and compound words to be divided etymologically, the active character " is given a special definition so as to behave as a discretionary break with hyphenation allowed after it. Most of the code for dealing with the active " is already contained in the core of babel, but we are going to use it as a single character shorthand for Latin.

```
33.1 \initiate@active@char{"}%
33.2 \addto\extraslatin{\bbl@activate{"}%
33.3 }
```

A temporary macro is defined so as to take different actions in math mode and text mode: specifically in the former case the macro inserts a double quote as it should in math mode, otherwise another delayed macro comes into action.

```
33.4 \declare@shorthand{latin}{"}{%
33.5 \ifmmode
33.6 \def\lt@@next{''}}%
33.7 \else
33.8 \def\lt@@next{\futurelet\lt@temp\lt@cwm}%
33.9 \fi
33.10 \lt@@next
33.11 }%
```

In text mode the \lt@next control sequence is such that upon its execution a temporary variable \lt@temp is made equivalent to the next token in the input list without actually removing it. Such temporary token is then tested by the macro \lt@cwm and if it is found to be a letter token, then it introduces a compound word separator control sequence \lt@allowhyphens whose expansion introduces a discretionary hyphen and an unbreakable space; in case the token is not a letter, the token is tested again to find if it is the character |, in which case it is gobbled and a discretionary break is introduced.

```
33.12 \def\lt@allowhyphens{\nobreak\discretionary{-}{}{}\nobreak\hskip\z@skip}
33.13 \newcommand*{\lt@cwm}{\lt@n@xt\relax}
33.14
       \ifcat\noexpand\lt@temp a%
         \let\lt@n@xt\lt@allowhyphens
33.15
       \else
33.16
         \if\noexpand\lt@temp\string|%
33.17
             \def\lt@n@xt{\lt@allowhyphens\@gobble}%
33.18
         \fi
33.19
      \fi
33.20
      \t 0.00xt}
33.21
```

Attention: the category code comparison does not work if the temporary control sequence \lt@temp has been let equal to an implicit character, such as \ae; therefore this etymological hyphenation facility does not work with medieval Latin spelling when " immediately precedes a ligature. In order to overcome this drawback the shorthand "| may be used in such cases; it behaves exactly as ", but it does not test the implicit character control sequence. An input such as super"|{\ae}quitas^{33} gets hyphenated as su-per-æqui-tas instead of su-pe-ræ-qui-tas.

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
33.22 \ldf@finish{latin} 33.23 \langle /code \rangle
```

 $<sup>^{33}</sup>$ This word does not exist in "regular" Latin, and it is used just as an example.

# 34 The Portuguese language

The file portuges.dtx<sup>34</sup> defines all the language-specific macros for the Portuguese language as well as for the Brasilian version of this language.

For this language the character " is made active. In table 8 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "" like "-, but producing no hyphen sign (for words that should break at some sign such as "entrada/salida."
- "
  for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).
- \- like the old \-, but allowing hyphenation in the rest of the word.

Table 8: The extra definitions made by portuges.ldf

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
\begin{array}{ll} 34.1 \ \langle *code \rangle \\ 34.2 \ Ldf Init \ CurrentOption \{ captions \ CurrentOption \} \end{array}
```

When this file is read as an option, i.e. by the \usepackage command, portuges will be an 'unknown' language in which case we have to make it known. So we check for the existence of \logortuges to see whether we have to do something here. Since it is possible to load this file with any of the following four options to babel: portuges, portuguese, brazil and brazilian we also allow that the hyphenation patterns are loaded under any of these four names. We just have to find out which one was used.

```
34.3 \ifx\l@portuges\@undefined
       \ifx\l@portuguese\@undefined
34.4
         \ifx\l@brazil\@undefined
34.5
           \ifx\l@brazilian\@undefined
34.6
              \Onopatterns{Portuguese}
34.7
34.8
              \adddialect\l@portuges0
34.9
           \else
34.10
              \let\l@portuges\l@brazilian
           \fi
34 11
         \else
34.12
           \let\l@portuges\l@brazil
34.13
         \fi
34.14
34.15
       \else
34 16
         \let\l@portuges\l@portuguese
       \fi
34.17
34.18 \fi
```

By now \logortuges is defined. When the language definition file was loaded under a different name we make sure that the hyphenation patterns can be found.

<sup>34</sup>The file described in this section has version number v1.2q and was last revised on 2008/03/18. Contributions were made by Jose Pedro Ramalhete (JRAMALHECCERNVM or Jose-Pedro\_Ramalhete@MACMAIL) and Arnaldo Viegas de Lima arnaldo@VNET.IBM.COM.

```
34.19 \expandafter\ifx\csname l@\CurrentOption\endcsname\relax
34.20 \expandafter\let\csname l@\CurrentOption\endcsname\l@portuges
34.21 \fi
```

Now we have to decide whether this language definition file was loaded for Portuguese or Brasilian use. This can be done by checking the contents of \CurrentOption. When it doesn't contain either 'portuges' or 'portuguese' we make \bbl@tempb empty.

```
34.22 \def\bbl@tempa{portuguese}
34.23 \ifx\CurrentOption\bbl@tempa
      \let\bbl@tempb\@empty
34.24
34.25 \else
       \def\bbl@tempa{portuges}
34.26
       \ifx\CurrentOption\bbl@tempa
34.27
         \let\bbl@tempb\@empty
34.28
34.29
       \else
         \def\bbl@tempb{brazil}
34.30
       \fi
34.31
34 32 \fi
34.33 \ifx\bbl@tempb\@empty
```

The next step consists of defining commands to switch to (and from) the Portuguese language.

\captionsportuges

The macro \captionsportuges defines all strings used in the four standard document classes provided with IATEX.

```
34.34 \@namedef{captions\CurrentOption}{%
34.35 \def\prefacename{Pref\'acio}%
34.36 \def\refname{Refer\^encias}%
34.37 \def\abstractname{Resumo}%
34.38 \def\bibname{Bibliografia}%
34.39 \def\chaptername{Cap\'{\i}tulo}%
34.40 \def\appendixname{Ap\^endice}%
```

Some discussion took place around the correct translations for 'Table of Contents' and 'Index'. the translations differ for Portuguese and Brasilian based the following history:

The whole issue is that some books without a real index at the end misused the term 'Índice' as table of contents. Then, what happens is that some books apeared with 'Índice' at the begining and a 'Índice Remissivo' at the end. Remissivo is a redundant word in this case, but was introduced to make up the difference. So in Brasil people started using 'Sumário' and 'Índice Remissivo'. In Portugal this seems not to be very common, therefore we chose 'Índice' instead of 'Índice Remissivo'.

```
\def\contentsname{Conte\', udo}%
34 41
         \def\listfigurename{Lista de Figuras}%

34.96 \providehyphenmins{\CurrentOption}{\tw0\thr00}

 $\verb|\extrasportuges| \\ \verb|\noextrasportuges| \\$ 

The macro \extrasportuges will perform all the extra definitions needed for the Portuguese language. The macro \noextrasportuges is used to cancel the actions of \extrasportuges.

For Portuguese the " character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the portuguese group of shorthands should be used.

Don't forget to turn the shorthands off again.

34.101 \addto\noextrasportuges{\bbl@deactivate{"}}

First we define access to the guillemets for quotations,

then we define two shorthands to be able to specify hyphenation breakpoints that behave a little different from  $\setminus$ -.

```
34.106 \end{portuges} {"-} {\nobreak-\bbl@allowhyphens} \\ 34.107 \end{portuges} {""} {\hskip\z@skip}
```

And we want to have a shorthand for disabling a ligature.

```
34.108 \end{portuges} \begin{tabular}{l} 34.108 \end{tabular} $$ 34.109 \textormath{\discretionary{-}{}{\kern.03em}}{} $$
```

\- All that is left now is the redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TeX in this respect is very unfortunate for languages such as Dutch and German, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation position on top of the ones that TeX can generate from the hyphenation patterns.

```
34.110 \expandafter\addto\csname extras\CurrentOption\endcsname {\% 34.111 \babel@save-} \\ 34.112 \expandafter\addto\csname extras\CurrentOption\endcsname {\% 34.113 \def\-{\allowhyphens}} }
```

```
\ord We also provide an easy way to typeset ordinals, both in the male (\ord or \ro)
\ro and the female (orda or \ra) form.
\ord34.114 \def\ord{$^{\rm o}$}
\r94.115 \def\orda{$^{\rm a}$}
34.116 \let\ro\ord\let\ra\orda
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
34.117 \ \label{ldf0finish} \ \Current0ption \\ 34.118 \ \slabel{ldf0finish}
```

# 35 The Spanish language

The file spanish.dtx<sup>35</sup> defines all the language-specific macros for the Spanish language.

Spanish support is implemented following mainly the guidelines given by José Martínez de Sousa. You may get the the full documentation (more comprehensive, but regrettably only in Spanish) by typesetting spanish.dtx directly. There are examples and some additional features documented in the Spanish version only. Cross-references in this section point to that document.

#### Features This style provides:

- Translations following the International LATEX conventions, as well as \today.
- Shorthands listed in Table 9. Examples in subsection 3.4 are illustrative. Notice that "~ has a special meaning in spanish different to other languages, and is used mainly in linguistic contexts.
- \frenchspacing.
- In math mode, a dot followed by a digit is replaced by a decimal comma.
- Spanish ordinals and abbreviations with the \sptext{\lambda text\} command as, for instance, 1\sptext{er}. The preceptive dot is included.
- Accented (lim, máx, mín, mód) and spaced (arc cos, etc.) functions.
- \dotlessi is provided for use in math mode.
- A quoting environment and a related pair of shorthands << and >>. Useful for traditional spanish multi-paragraph quoting.
- There is a small space before the percent \% sign.
- \lsc provides lowercase small caps. (See subsection 3.10.)
- Ellipsis is best typed as ... or, within a sentence, as \...

If spanish is the main language, the command \layoutspanish is added to the main group, modifying the standard classes throughout the whole document in the following way:

- Paragraphs are set with \indentfirst.
- Both enumerate and itemize are adapted to Spanish rules.
- Both \alph and \Alph include  $\tilde{n}$  after n.
- Symbol footmarks are one, two, three, etc., asterisks.

<sup>&</sup>lt;sup>35</sup>The file described in this section has version number v5.0e and was last revised on 2008/07/06. The maintainer from v4.0 on is Javier Bezos (http://www.texytipografia.com). Previous versions were made by Julio Sánchez. The English documentation has been improved by José Luis Rivera; thanks to him it is now a lot clearer.

```
Acute accented a. Works for e, i, o, u, too (both
'a
           lowercase and uppercase).
'n
           ñ (uppercase too).
"i
           i (uppercase too).
"u
           ü (uppercase too).
"a "o
           Ordinal numbers (uppercase "A, "O too).
           Ordinal 1.^{er} 1.^{er}
"er "ER
"с
           ç (uppercase too).
"rr
           rr, but -r when hyphenated.
"y
           An old ligature for "et" (like the English &).
           Like \-, but allowing hyphenation in the rest the
           word.
II _
           Like -, but allowing hyphenation in the rest the
           word.
           The hyphen is repeated at the very beginning of the
           next line if the word is hyphenated at this point.
           Like "- but producing no hyphen sign.
           Like "- but with no break after the hyphen. Works
           for en-dashes (~--) and em-dashes (~---). "+, "+-
           and "+-- are synonymous.
           A slash slightly lowered, if necessary.
           Disable ligatures at this point.
" <
           Left guillemets.
">
           Right guillemets.
           \begin{quoting} and \end{quoting}. (See below.)
<< >>
           "' and "' are synonymous.
"? "!
           Opening question and exlamation marks (ii) aligned
           on the baseline, useful for all-caps headings, etc.
```

Table 9: Extra definitions made by file spanish.ldf

- OT1 guillemets are generated with two lasy symbols instead of small \11 and \gg.
- \roman is redefined to write small caps Roman numerals, since lowercase Roman numerals are discouraged (see below).
- There is a dot after section numbers in titles, headings, and toc.

A subset of these features is implemented for Plain TEX (accesible with the command \input spanish.sty). Most significantly, \lsc, the quoting environment, and features provided by \layoutspanish are missing.

Customization Beginning with version 5.0, customization is made following two paths: via options or via commands; these options and commands override the layout for Spanish documents at different levels: options are meant for use at the preamble only, while commands may be used in the configuration file or at document level.

Global options control the overall appearance of the document, and may be set on the {babel} call, right after calling spanish, or shortly before the call to

Basic Options	es-minimal	es-sloppy	es-noshorthands
es-noindentfirst	X	X	
es-nosectiondot	X	X	
es-nolists	X	X	
es-noquoting	X	X	X
es-notilde	X	X	X
es-nodecimaldot	X	X	X
es-nolayout		X	
es-ucroman	X		
es-lcroman	X	X	

Table 10: Spanish Customization Options

{babel}, to ensure their proper loading at runtime. Thus, the following calls are roughly equivalent:

```
\usepackage[...,spanish,es-nosectiondot,es-nodecimaldot,...]{babel}
\def\spanishoptions{es-nosectiondot,es-nodecimaldot}
\usepackage[...,spanish,...]{babel}
```

Some global options are built upon lower level options, and may be used as shorthand for more global customizations. Table 10 gives an overview of the global options constructed this way. Most of these options are self-explanatory: they disable the changes made to the basic LaTeX layout by spanish. es-lcroman however, and a few others, need a bit of explanation, and they may be described as follows:

- Traditional Spanish typography discourages the use of lowercase Roman numerals; instead, a smallcaps variant is implemented. However, since Makeindex seems to choke on the code implementing lowercase Roman numerals (via the \lsc macro), two workarounds are implemented: the es-ucroman option converts all Roman numerals to uppercase, and the es-lcroman option turns all Roman numerals to lowercase; the former should be preferred over the latter. Three macros control local changes to Roman numbers: \spanishscroman, \spanishucroman, and \spanishlcroman.
- The es-preindex option calls the romanidx.sty package automatically to fix index entries in smallcaps roman form. An additional macro, \spanishindexchars{\langle encap\} {\langle openrange \rangle} {\langle closerange \rangle} \determines the characters delimiting index entries. Defaults are \spanishindexchars{|}{()}{)}.
- The es-tilden option restores the old tilde ~ shorthand for ñ. This shorthand is however *strongly* deprecated.
- The es-nolayout option disables layout changes in the document when spanish is the main language. These changes affect enumerated and itemized lists, enumerations (alphabetic order excludes ñ), and symbolic footnotes
- The es-noshorthands disables the shorthand mechanism completely: neither " nor ' nor < nor > nor " nor . work at all.

- The es-noquoting option disables the macros << and >> calling the quoting environment; the alternative macros "' and "' are still available.
- The es-uppernames option makes uppercase versions of captions for chapter, tablename, etc.
- The es-tabla option changes "cuadro" for "tabla" in captions.

Finally, the Spanish 5 series begins the implementation of national variations of Spanish typography, beginning with Mexico. Thus the global options mexico and mexico-com are adapted to practices spread in Mexico, and perhaps Central America, the Caribbean, and some countries in South America.<sup>36</sup>

Many of the global options are implemented via macros, which may be included in the configuration file spanish.cfg, in the preamble, after the call to babel, and in the body of the document. These macros are the following.

- The macros \spanishdashitems and \spanishsignitems change the values
  of itemized lists to a series of dashes or an alternative series of symbols,
  respectively.
- The command \deactivatequoting deactivates the << and >> shorthands
  if you want to use < and > in numerical comparisons and some AMSTEX
  commands.
- You may kill the space in spaced operators with \unspacedoperators.
- You may kill the accents on accented operators with \unaccentedoperators.
- The command \decimalpoint resets the decimal separator to its default (dot) value, while \spanishdecimal{\langle symbol \rangle} allows for an arbitrary definition.
- \spanishplainpercent prevents the addition of a thinspace before the percent sign in texts. This might be useful for parenthesized percent signs in tables, etc.
- The macros \spanishdatedel and \spanishdatede control the if the article is given in years (del or de).
- The macro \spanishreverseddate sets the date of the format "Month Day del Year".
- The macro \Today gives months in uppercase.
- The macros \spanish caption change the value of the caption automatically (no need to add an \addto).
- The command \spanishdeactivate{\langle characters \rangle} \ disables the shorthand characters listed in the argument. Elegible characters are the set .'"~<>. These shorthand characters may be globally deactivated for Spanish adding this command to \shorthandsspanish.

<sup>&</sup>lt;sup>36</sup>The main difference is that mexico disables the decimaldot mechanism, while mexico-com keeps it enabled; both change the quoting environment, disabling the use of guillemets.

```
\lquoti     "<
\rquoti     ">
\lquotii     ''
\rquotii     ''
\lquotiii     '
\rquotiii     '
```

Table 11: Default quoting signs set for the quoting environment.

- Extras are divided in groups controlled by the commands \textspanish, \mathspanish, \shorthandsspanish y \layoutspanish; their values may be cancelled typing \renewcommand{\(\langle command \rangle \} \}, or changed at will (check the Spanish documentation or the code for details).
- The command \spanishoperators{\langle operators \rangle} defines command names for operators in Spanish. There is no standard name for some of them, so they may be created or changed at will. For instance, the command \renewcommand{\spanishoperators}{arc\,ctg m\acute{i}n} creates commands for these functions. The command \, adds thinspaces at the appropriate places for spaced operators (like \arcctg in this case), and the command \acute{\lefter} adds an accent to the letter included in the definition (thus, m\acute{i}n defines the accented function \min (min); please notice that \dotlessi is not necessary).
- The command \selectspanish\* is obsolete: if spanish is the main language, all its features are available right after loading babel. The es-delayed option is provided to restore the previous behavior and macros for backwards compatibility.

#### 35.1 The Code

This file provides definition for both  $\LaTeX 2_{\varepsilon}$  and non  $\LaTeX 2_{\varepsilon}$  formats.

Now comes the text shorthands. They are grouped in  $\shorthandsspanish$  and this style performs some operations before the babel shortands are called. The aims are to allow espression like  $a^{x}$ , and to deactivate shorthands by making them of category 'other.' After providing a 'i shorthand, the new macros are defined.

 $35.341 \ensuremath{\texttt{NT1}}{i}{\texttt{Command}$

# 36 The Catalan language

The file  $\mathtt{catalan.dtx}^{37}$  defines all the language-specific macro's for the Catalan language.

For this language only the double quote character (") is made active by default. In table 12 an overview is given of the new macros defined and the new meanings of ". Additionally to that, the user can explicitly activate the acute accent or apostrophe (') and/or the grave accent (') characters by using the activeacute and activegrave options. In that case, the definitions shown in table 13 also become available<sup>38</sup>.

- \lambda1.1 geminated-l digraph (similar to l·l). \L.L produces the uppercase version.
- \lgem geminated-l digraph (similar to l·l). \Lgem produces the uppercase version.
- \up Macro to help typing raised ordinals, like 1<sup>er</sup>. Takes one argument.
- \- like the old \-, but allowing hyphenation in the rest of the word.
- "i i with diaeresis, allowing hyphenation in the rest of the word. Valid for the following vowels: i, u (both lowercase and uppercase).
- "c c-cedilla (ç). Valid for both uppercase and lowercase c.
- "1 geminated-l digraph (similar to l·l). Valid for both uppercase and lowercase l.
- "
  French left double quotes (similar to <<).
- "> French right double quotes (similar to >>).
- "- explicit hyphen sign, allowing hyphenation in the rest of the word.
- "| disable ligature at this position.

Table 12: Extra definitions made by file catalan.ldf (activated by default)

- 'e acute accented a, allowing hyphenation in the rest of the word. Valid for the following vowels: e, i, o, u (both lowercase and uppercase).
- 'a grave accented a, allowing hyphenation in the rest of the word. Valid for the following vowels: a, e, o (both lowercase and uppercase).

Table 13: Extra definitions made by file catalan.ldf (activated only when using the options activeacute and activegrave)

These active accents characters behave according to their original definitions

 $<sup>^{37}\</sup>mathrm{The}$  file described in this section has version number v2.2p and was last revised on 2005/03/29.

<sup>&</sup>lt;sup>38</sup>Please note that if the acute accent character is active, it is necessary to take special care of coding apostrophes in a way which cannot be confounded with accents. Therefore, it is necessary to type 1'{}estri instead of l'estri.

if not followed by one of the characters indicated in that table.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
36.1 \langle *code \rangle

36.2 \backslash LdfInit\{catalan\} \backslash captions catalan
```

When this file is read as an option, i.e. by the \usepackage command, catalan could be an 'unknown' language in which case we have to make it known. So we check for the existence of \locatalan to see whether we have to do something here.

```
36.3 \ifx\l@catalan\@undefined
36.4 \@nopatterns{Catalan}
36.5 \adddialect\l@catalan0
36.6 \fi
```

The next step consists of defining commands to switch to (and from) the Catalan language.

\catalanhyphenmins This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

36.7 \providehyphenmins{catalan}{\tw@\tw@}

\captionscatalan The macro \captionscatalan defines all strings used in the four standard document classes provided with IATEX.

```
36.8 \addto\captionscatalan{%
      \def\prefacename{Pr\'oleg}%
36.10
      \def\refname{Refer\'encies}%

      \def\proofname{Demostraci\'o}%
      \def\glossaryname{Glossari}%
36.29
36.30 }
```

\datecatalan The macro \datecatalan redefines the command \today to produce Catalan dates. Months are written in lowercase<sup>39</sup>.

```
36.31 \def\datecatalan{%
```

 $<sup>^{39} {\</sup>rm This}$  seems to be the common practice. See for example: E. Coromina, El 9 Nou: Manual de redacció i estil, Ed. Eumo, Vic, 1993

```
36.32 \def\today{\number\day^\ifcase\month\or
36.33 de gener\or de febrer\or de mar\c{c}\or d'abril\or de maig\or
36.34 de juny\or de juliol\or d'agost\or de setembre\or d'octubre\or
36.35 de novembre\or de desembre\fi
36.36 \space de^\number\year}}
```

\extrascatalan \noextrascatalan

The macro \extrascatalan will perform all the extra definitions needed for the Catalan language. The macro \noextrascatalan is used to cancel the actions of \extrascatalan.

To improve hyphenation we give the grave character (') a non-zero lower case code; when we do that TEX will find more breakpoints in words that contain this character in its rôle as apostrophe.

```
36.37 \addto\extrascatalan{%
36.38 \lccode''=''}
36.39 \addto\noextrascatalan{%
36.40 \lccode''=0}
```

For Catalan, some characters are made active or are redefined. In particular, the "character receives a new meaning; this can also happen for the 'character and the 'character when the options activegrave and/or activeacute are specified.

```
36.41 \addto\extrascatalan{\languageshorthands{catalan}} \\ 36.42 \initiate@active@char{"} \\ 36.43 \addto\extrascatalan{\bbl@activate{"}}
```

Because the grave character is being used in constructs such as \catcode''=\active it needs to have it's original category code" when the auxiliary file is being read. Note that this file is read twice, once at the beginning of the document; then there is no problem; but the second time it is read at the end of the document to check whether any labels changes. It's this second time round that the actived grave character leads to error messages.

```
36.44 \@ifpackagewith{babel}{activegrave}{%
36.45
      \AtBeginDocument{%
36.46
         \if@filesw\immediate\write\@auxout{\catcode096=12}\fi}
36.47
       \initiate@active@char{'}%
36.49 \@ifpackagewith{babel}{activegrave}{%
      \addto\extrascatalan{\bbl@activate{'}}%
36.50
36.51
36.52 \@ifpackagewith{babel}{activeacute}{%
      \initiate@active@char{'}%
36.53
36.54
36.55 \@ifpackagewith{babel}{activeacute}{%
       \addto\extrascatalan{\bbl@activate{'}}%
36.56
36.57
```

Now make sure that the characters that have been turned into shorthanfd characters expand to 'normal' characters outside the catalan environment.

```
36.58 \addto \noextras catalan { bbl@deactivate {"}} \\ 36.59 \end{to} addto \noextras catalan { bbl@deactivate {'}} { } \\ 36.60 \addto \noextras catalan { bbl@deactivate {'}} { } \\ 36.61 \end{to} addto \noextras catalan { bbl@deactivate {'}} { } \\ 36.62 \addto \noextras catalan { bbl@deactivate {'}} { } { } \\ \end{cases}
```

Apart from the active characters some other macros get a new definition. Therefore we store the current ones to be able to restore them later. When their current meanings are saved, we can safely redefine them.

We provide new definitions for the accent macros when one or both of the options activegrave or activeacute were specified.

```
36.63 \addto\extrascatalan{%
       \babel@save\"%
36.64
       \def\"{\protect\@umlaut}}%
36.66 \@ifpackagewith{babel}{activegrave}{%
       \babel@save\'%
36.67
       \addto\extrascatalan{\def\'{\protect\@grave}}
36.68
36.69
       } { }
36.70 \@ifpackagewith{babel}{activeacute}{%
       \babel@save\'%
36.71
36.72
       \addto\extrascatalan{\def\',{\protect\@acute}}
36.73
```

All the code above is necessary because we need a few extra active characters. These characters are then used as indicated in tables 12 and 13.

\dieresis \textacute \textgrave The original definition of \" is stored as \dieresis, because the definition of \" might not be the default plain TEX one. If the user uses POSTSCRIPT fonts with the Adobe font encoding the " character is not in the same position as in Knuth's font encoding. In this case \" will not be defined as \accent"7F 1, but as \accent'310 #1. Something similar happens when using fonts that follow the Cork encoding. For this reason we save the definition of \" and use that in the definition of other macros. We do likewise for \', and \'.

```
36.74 \let\dieresis\"
36.75 \@ifpackagewith{babel}{activegrave}{\let\textgrave\'}{}
36.76 \@ifpackagewith{babel}{activeacute}{\let\textacute\'}{}
```

\@umlaut \@acute \@grave We check the encoding and if not using T1, we make the accents expand but enabling hyphenation beyond the accent. If this is the case, not all break positions will be found in words that contain accents, but this is a limitation in TEX. An unsolved problem here is that the encoding can change at any time. The definitions below are made in such a way that a change between two 256-char encodings are supported, but changes between a 128-char and a 256-char encoding are not properly supported. We check if T1 is in use. If not, we will give a warning and proceed redefining the accent macros so that TEX at least finds the breaks that are not too close to the accent. The warning will only be printed to the log file.

```
36.77 \ifx\DeclareFontShape\@undefined
      \wlog{Warning: You are using an old LaTeX}
36.78
      \wlog{Some word breaks will not be found.}

        \def\@acute#1{\allowhyphens\textacute{#1}\allowhyphens}}{}
36.82
36.83
      \@ifpackagewith{babel}{activegrave}{%
        \def\@grave#1{\allowhyphens\textgrave{#1}\allowhyphens}}{}
36.84
36.85 \else
      \ifx\f@encoding\bbl@t@one
36.86
        \let\@umlaut\dieresis
36.87
36.88
         \@ifpackagewith{babel}{activeacute}{%
```

```
\let\@acute\textacute}{}
36.89
          \@ifpackagewith{babel}{activegrave}{%
36.90
            \let\@grave\textgrave}{}
36.91
36.92
        \else
36.93
          \wlog{Warning: You are using encoding \f@encoding\space
            instead of T1.}
36.94
          \wlog{Some word breaks will not be found.}
36.95
          \def\@umlaut#1{\allowhyphens\dieresis{#1}\allowhyphens}
 36.96
36.97
          \0 ifpackagewith{babel}{activeacute}{%
            \def\@acute#1{\allowhyphens\textacute{#1}\allowhyphens}}{}
36.98
          \0 ifpackagewith{babel}{activegrave}{%
36.99
            \def\@grave#1{\allowhyphens\textgrave{#1}\allowhyphens}}{}
36 100
36.101
36.102 \fi
```

If the user setup has extended fonts, the Ferguson macros are required to be defined. We check for their existance and, if defined, expand to whatever they are defined to. For instance, \'a would check for the existance of a \@ac@a macro. It is assumed to expand to the code of the accented letter. If it is not defined, we assume that no extended codes are available and expand to the original definition but enabling hyphenation beyond the accent. This is as best as we can do. It is better if you have extended fonts or ML-TEX because the hyphenation algorithm can work on the whole word. The following macros are directly derived from ML-TEX.  $^{40}$ 

Now we can define our shorthands: the diaeresis and "ela geminada" support,

```
36.103 \declare@shorthand{catalan}{"i}{\textormath}{\dot\imath}}
36.104 \ensuremath{\mbox{declare@shorthand{catalan}{"l}{\lgem{}}}
36.106 \declare@shorthand{catalan}{"I}{\textormath{\@umlaut I}{\ddot I}}
36.107 \end{catalan} {"L}{\end{cem{}}}
36.108 \declare@shorthand{catalan}{"U}{\textormath{\@umlaut U}{\ddot U}}
  cedille.
'french' quote characters,
36.111 \declare@shorthand{catalan}{"<}{%
      \textormath{\guillemotleft}{\mbox{\guillemotleft}}}
36.113 \declare@shorthand{catalan}{">}{%
     \textormath{\guillemotright}{\mbox{\guillemotright}}}
  grave accents,
36.115 \@ifpackagewith{babel}{activegrave}{%
      \declare@shorthand{catalan}{'a}{\textormath{\@grave a}{\grave a}}
      \declare@shorthand{catalan}{'e}{\textormath{\@grave e}{\grave e}}
36.117
      \declare@shorthand{catalan}{'o}{\textormath{\@grave o}{\grave o}}
36.118
```

<sup>&</sup>lt;sup>40</sup>A problem is perceived here with these macros when used in a multilingual environment where extended hyphenation patterns are available for some but not all languages. Assume that no extended patterns exist at some site for French and that french.sty would adopt this scheme too. In that case, 'e in French would produce the combined accented letter, but hyphenation around it would be suppressed. Both language options would need an independent method to know whether they have extended patterns available. The precise impact of this problem and the possible solutions are under study.

```
\declare@shorthand{catalan}{'A}{\textormath{\@grave A}{\grave A}}
36 119
                    \declare@shorthand{catalan}{'E}{\textormath{\@grave E}{\grave E}}

36.139
        and finally, some support definitions
36.140 \declare@shorthand{catalan}{"-}{\nobreak-\bbl@allowhyphens}
36.141 \declare@shorthand{catalan}{"|}{%}
                   \textormath{\nobreak\discretionary{-}{}{\kern.03em}%
36 142
                                                   \allowhyphens}{}}
36.143
```

\- All that is left now is the redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TeX in this respect is unfortunate for Catalan but not as much as for Dutch or German, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation position on top of the ones that TeX can generate from the hyphenation patterns. However, the average length of words in Catalan makes this desirable and so it is kept here.

```
36.144 \addto\extrascatalan{%
36.145 \babel@save{\-}%
36.146 \def\-{\bbl@allowhyphens\discretionary{-}{}{}\bbl@allowhyphens}}
```

\lgem Here we define a macro for typing the catalan "ela geminada" (geminated l). The macros \lgem and \Lgem have been chosen for its lowercase and uppercase representation, respectively<sup>41</sup>.

The code used in the actual macro used is a combination of the one proposed by Feruglio and Fuster<sup>42</sup> and the proposal<sup>43</sup> from Valiente presented at the T<sub>F</sub>X Users

<sup>&</sup>lt;sup>41</sup>The macro names \11 and \LL were not taken because of the fact that \11 is already used in mathematical mode.

<sup>&</sup>lt;sup>42</sup>G. Valiente and R. Fuster, Typesetting Catalan Texts with T<sub>E</sub>X, TUGboat 14(3), 1993.

<sup>&</sup>lt;sup>43</sup>G. Valiente, Modern Catalan Typographical Conventions, TUGboat 16(3), 1995.

Group Annual Meeting in 1995. This last proposal has not been fully implemented due to its limitation to CM fonts.

```

\l.1 It seems to be the most natural way of entering the "ela geminda" to use the \L.L sequences \l.1 and \L.L. These are not really macro's by themselves but the macros \l and \L with delimited arguments. Therefor we define two macros that check if the next character is a period. If not the "polish l" will be typeset, otherwise a "ela geminada" will be typeset and the next two tokens will be 'eaten'.

```

```

 $\label{lem:condition} $$ \sup $A$ macro for type setting things like $1^{er}$ as proposed by Raymon Seroul$^4$. $$ 36.194 \DeclareRobustCommand*{\up}[1]{\text{textsuperscript}${$\#1$}}$$ 

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

 $\begin{array}{l} 36.195 \ \texttt{\ldf@finish\{catalan\}} \\ 36.196 \ \texttt{\ldf@finish\{catalan\}} \end{array}$ 

<sup>&</sup>lt;sup>44</sup>This macro has been borrowed from francais.dtx

### 37 This file

This file defines all the language-specific macros for the Galician language. The file galician.dtx was translated in January 2007 by Javier A. Múgica from spanish.dtx. It was given the version number 4.3, based on the version for spanish.dtx at those times, that was 4.2b. The original author from v4.0 to 4.2b was Javier Bezos. Previous versions were written by Julio Sánchez.

I decided to make *tabula rasa* of all \changes logs. Only changes from spanish 4.2b to galician 4.3 and thereafter are documented. The change history for the original spanish.dtx can be found in that file.

## 38 The Galcian language

Custumization is made following mainly the books on the subject by José Martínez de Sousa and Xosé Feixó Cid. By typesetting galician.dtx directly you will get the full documentation (regrettably is in Galician only, but it is pretty long). References in this part refers to that document. There are several aditional features documented in the Galician version only.

This style provides:

- Translations following the International LaTeX conventions, as well as \today.
- Shorthands listed in Table 14. Examples in subsection 3.4 are illustrative. Note that "~ has a special meaning in galician different to other languages, and is used mainly in linguistic contexts.
- \deactivatetilden deactivates the ~n and ~N shorthands.
- In math mode a dot followed by a digit is replaced by a decimal comma.
- Galicians ordinals and abbeviations with \sptext as, for instance, 1\sptext{0}. The preceptive dot is included.
- Accented functions: lím, máx, mín, mód. You may globally omit the accents with \unaccentedoperators. Spaced functions: arc cos, etc. You may globally kill that space with \unspacedoperators. \dotlessi is provided for use in math mode.
- A quoting environment and a related pair of shorthands << and >>. The command \deactivatequoting deactivates these shorthand in case you want to use < and > in some AMS commands and numerical comparisons.
- The command \selectgalician selects the galician language and its shorthands. (Intended for the preamble.)
- \frenchspacing is used.
- \dots is redefined. It is now equal to typing tree points in a row (it preserves the space following).
- There is a small space before \%.
- \msc provides lowercase small caps. (See subsection 3.10.)

- 'a acute accented a. Also for: e, i, o, u (both lowercase and uppercase).
- 'n ñ (also uppercase).
- ~n ~n (also uppercase). Deprecated.
- "u ü (also uppercase).
- "i "i (also uppercase).
- "a Ordinal numbers (also "A, "o, "O).
- "rr rr, but -r when hyphenated
- "- Like \-, but allowing hyphenation in the rest the word
- "= Like -, but allowing hyphenation in the rest the word.
- " The hyphen is repeated at the very beginning of the next line if the word is hyphenated at this point.
- "" Like "- but producing no hyphen sign.
- ~- Like but with no break after the hyphen. Also for: en-dashes (~--) and em-dashes (~---).
- "/ A slash slightly lowered, if necessary.
- "| disable ligatures at this point.
- << Left guillemets.
- >> Right guillemets.
- "< \begin{quoting}. (See text.)
- "> \end{quoting}. (See text.)

Table 14: Extra definitions made by file galician.ldf

Just in case galician is the main language, the group \layoutgalician is activated, which modifies the standard classes through the whole document (it cannot be deactivated) in the following way:

- Both enumerate and itemize are adapted to Galician rules.
- Both \alph and \Alph include  $\tilde{n}$  after n.
- Symbol footmarks are one, two, three, etc., asteriscs.
- $\bullet$  0T1 guillemets are generated with two lasy symbols instead of small \11 and \gg.
- \roman is redefined to write small caps roman numerals, since lowercase roman numerals are not allowed. However, *MakeIndex* rejects entries containing pages in that format. The .idx file must be preprocessed if the document has this kind of entries with the provided romanidx.tex tool—just TEX it and follow the instructions.
- There is a dot after section numbers in titles and toc.

This group is ignored if you write \selectgalician\* in the preamble.

Some additional commands are provided to be used in the galician.cfg file:

• With \gl@activeacute acute accents are always active, overriding the default babel behaviour.

- \gl@enumerate sets the labels to be used by enumerate. The same applies to \gl@itemize and itemize.
- \gl@operators stores the operator commands. All of them are canceled with

\let\gl@operators\relax

The commands \deactivatequoting, \deactivatetilden and \selectgalician may be used in this file, too.

A subset of these commands is provided for use in Plain TeX (with \input galician.sty).

#### 38.1 The Code

This file provides definition for both LATEX  $2_{\varepsilon}$  and non LATEX  $2_{\varepsilon}$  formats. Identify the ldf file.

```
38.1 (*code)
38.2 \ProvidesLanguage{galician.ldf}
38.3 [2008/07/06 v4.3c Galician support from the babel system]
```

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc. When this file is read as an option, i.e. by the \usepackage command, galician will be an 'unknown' language in which case we have to make it known. So we check for the existence of \l@galician to see whether we have to do something here.

```
38.4 \LdfInit{galician}\captionsgalician
38.5 \ifx\undefined\l@galician
38.6 \@nopatterns{Galician}
38.7 \adddialect\l@galician0
38.8 \fi
```

We define some tools which will be used in that style file: (1) we make sure that ~ is active, (2) \gl@delayed delays the expansion of the code in conditionals (in fact, quite similar to \bbl@afterfi).

```
38.9 \edef\gl@savedcatcodes{%
     \catcode '\noexpand\~=\the\catcode '\~
      \catcode '\noexpand\"=\the\catcode '\"}
38.12 \catcode'\"=\active

```

We follow with the math group. It's not easy to add an accent in an operator. The difficulty is that we must avoid using text (that is, \mbox) because we have no control on font and size, and at time we should access \i, which is a text command forbidden in math mode. \dotlessi must be converted to uppercase if necessary in LATEX  $2_{\mathcal{E}}$ . There are two versions, depending on the format.

```

Now comes the text shorthands. They are grouped in \shorthandsgalician and this style performs some operations before the babel shortands are called. The goals are to allow espression like \$a^{x'}\$ and to deactivate the shorthands making them of category 'other'. After providing a \'i shorthand, the new macros are defined.

# 39 The Basque language

The file basque.dtx<sup>45</sup> defines all the language definition macro's for the Basque language.

For this language the characters  $\tilde{}$  and " are made active. In table 15 an overview is given of their purpose. These active accent characters behave according

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- \- like the old \-, but allowing hyphenation in the rest of the word.
- "< for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).
- n a n with tilde. Works for uppercase too.

Table 15: The extra definitions made by basque.ldf

to their original definitions if not followed by one of the characters indicated in that table.

This option includes support for working with extended, 8-bit fonts, if available. Support is based on providing an appropriate definition for the accent macros on entry to the Basque language. This is automatically done by  $\LaTeX$  or NFSS2. If T1 encoding is chosen, and provided that adequate hyphenation patterns<sup>46</sup> are available. The easiest way to use the new encoding with  $\LaTeX$  is to load the package tlenc with \usepackage. This must be done before loading babel.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
39.1 \ \ensuremath{\mbox{\sc sque}}\ 39.2 \LdfInit{basque}\captionsbasque}
```

When this file is read as an option, i.e. by the \usepackage command, basque could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lobasque to see whether we have to do something here.

```
39.3 \ifx\l@basque\@undefined
39.4 \@nopatterns{Basque}
39.5 \adddialect\l@basque0
39.6 \fi
```

The next step consists of defining commands to switch to (and from) the Basque language.

\captionsbasque

The macro \captionsbasque defines all strings used in the four standard document classes provided with LATEX.

```
39.7 \addto\captionsbasque{%
39.8 \def\prefacename{Hitzaurrea}%
39.9 \def\refname{Erreferentziak}%
```

<sup>&</sup>lt;sup>45</sup>The file described in this section has version number v1.0f and was last revised on 2005/03/29. The original author is Juan M. Aguirregabiria, (wtpagagj@lg.ehu.es) and is based on the Spanish file by Julio Sánchez, (jsanchez@gmv.es).

39.48

\dieresia \texttilde The original definition of \" is stored as \dieresia, because the we do not know what is its definition, since it depends on the encoding we are using or on special macros that the user might have loaded. The expansion of the macro might use the TeX \accent primitive using some particular accent that the font provides or might check if a combined accent exists in the font. These two cases happen with respectively OT1 and T1 encodings. For this reason we save the definition of \" and use that in the definition of other macros. We do likewise for \', and \~. The present coding of this option file is incorrect in that it can break when the encoding changes. We do not use \tilde as the macro name because it is already defined as \mathaccent.

```
39.50 \let\dieresia\"
39.51 \let\texttilde\~
```

@umlaut @tilde We check the encoding and if not using T1, we make the accents expand but enabling hyphenation beyond the accent. If this is the case, not all break positions will be found in words that contain accents, but this is a limitation in TEX. An unsolved problem here is that the encoding can change at any time. The definitions below are made in such a way that a change between two 256-char encodings are supported, but changes between a 128-char and a 256-char encoding are not properly supported. We check if T1 is in use. If not, we will give a warning and proceed redefining the accent macros so that TEX at least finds the breaks that are not too close to the accent. The warning will only be printed to the log file.

39.76 \end{basque} {\n}{\text{textormath}\n}{\text{0tilde n}} \\ 39.77 \end{basque} {\n}{\text{textormath}\n}{\text{0tilde N}} \\ \text{and some additional commands}.
```

The shorthand "- should be used in places where a word contains an explicit hyphenation character. According to the Academy of the Basque language, when a word break occurs at an explicit hyphen it must appear both at the end of the first line and at the beginning of the second line.

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
39.83 \setminus 1df@finish\{basque\}

39.84 \langle /code \rangle
```

#### 40 The Romanian language

The file romanian.dtx<sup>48</sup> defines all the language-specific macros for the Romanian language.

For this language currently no special definitions are needed or available.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
40.1 (*code)
40.2 \LdfInit{romanian}\captionsromanian
```

When this file is read as an option, i.e. by the \usepackage command, romanian will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lambda Cromanian to see whether we have to do something here.

```
40.3 \ifx\l@romanian\@undefined
        \Onopatterns{Romanian}
40.4
        \adddialect\l@romanian0\fi
40.5
```

The next step consists of defining commands to switch to (and from) the Romanian language.

\captionsromanian The macro \captionsromanian defines all strings used in the four standard documentclasses provided with LATEX.

```
40.6\,\mathrm{ls}

# 41 The Danish language

The file  $\mathtt{danish.dtx}^{49}$  defines all the language definition macros for the Danish language.

For this language the character " is made active. In table 16 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "" like "-, but producing no hyphen sign (for words that should break at some sign such as "entrada/salida."
- "' lowered double left quotes (looks like ")
- "' normal double right quotes
- " for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).
- \- like the old \-, but allowing hyphenation in the rest of the word.

Table 16: The extra definitions made by danish.ldf

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
41.1 \(\rangle \text{code}\)
41.2 \(\text{Ldf Init{danish}}\) \(\text{captionsdanish}\)
```

When this file is read as an option, i.e. by the \usepackage command, danish will be an 'unknown' language in which case we have to make it known. So we check for the existence of \loganish to see whether we have to do something here.

```
41.3 \ifx\l@danish\@undefined
41.4 \@nopatterns{Danish}
41.5 \adddialect\l@danishO\fi
```

\englishhyphenmins

This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

 $41.6 \verb|\providehyphenmins{\CurrentOption}{\two\two}|$ 

The next step consists of defining commands to switch to (and from) the Danish language.

\captionsdanish The macro \captionsdanish defines all strings used in the four standard document classes provided with LATEX.

```
41.7 \addto\captionsdanish{%
41.8 \def\prefacename{Forord}%

```

\datedanish The macro \datedanish redefines the command \today to produce Danish dates.

```
41.30 \def\datedanish{%
41.31 \def\today{\number\day.~\ifcase\month\or
41.32 januar\or februar\or marts\or april\or maj\or juni\or
41.33 juli\or august\or september\or oktober\or november\or december\fi
41.34 \space\number\year}}
```

\extrasdanish The macro \extrasdanish will perform all the extra definitions needed for the \noextrasdanish Danish language. The macro \noextrasdanish is used to cancel the actions of \extrasdanish.

Danish typesetting requires \frenchspacing to be in effect.

```
41.35 \addto\extrasdanish{\bbl@frenchspacing} \\ 41.36 \addto\noextrasdanish{\bbl@nonfrenchspacing} \\
```

For Danish the " character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the danish group of shorthands should be used.

```
41.37 \initiate@active@char{"}
41.38 \addto\extrasdanish{\languageshorthands{danish}}
41.39 \addto\extrasdanish{\bbl@activate{"}}

Don't forget to turn the shorthands off again.
41.40 \addto\noextrasdanish{\bbl@deactivate{"}}
```

First we define access to the low opening double quote and guillemets for quotations,

```
41.41 \declare@shorthand{danish}{"'}{%
41.42 \textormath{\quotedblbase}{\mbox{\quotedblbase}}}
41.43 \declare@shorthand{danish}{"'}{%
41.44 \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
41.45 \declare@shorthand{danish}{"'>}{%
41.46 \textormath{\guillemotleft}{\mbox{\guillemotleft}}}
41.47 \declare@shorthand{danish}{"'>}{%
41.48 \textormath{\guillemotright}{\mbox{\guillemotright}}}
```

then we define commands to be able to specify hyphenation breakpoints that behave a little different from \-.

```
41.49 \declare@shorthand{danish}{""}{\hskip\z@skip}
41.50 \declare@shorthand{danish}{""}{\hskip\z@skip}
41.51 \declare@shorthand{danish}{""}{\textormath{\leavevmode\hbox{-}}{-}}
41.52 \declare@shorthand{danish}{"=}{\nobreak-\hskip\z@skip}

And we want to have a shorthand for disabling a ligature.
41.53 \declare@shorthand{danish}{"|}{%
41.54 \textormath{\discretionary{-}{}}{\kern.03em}}{}}

To enable hyphenation in two words, written together but separated by a slash, as in 'uitdrukking/opmerking' we define the command "/.
```

as in unturking/opinerking we define the command "/.

41.55 \declare@shorthand{dutch}{"/}{\textormath}

41.56 \{\bbl@allowhyphens\\discretionary{/}{}{/}\bbl@allowhyphens}{}}

\- All that is left now is the redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TEX in this respect is very unfortunate for languages such as Dutch and German, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation

position on top of the ones that T<sub>F</sub>X can generate from the hyphenation patterns.

```
 41.57 \expandafter\addto\csname extras\CurrentOption\endcsname \{\% 41.58 \babel@save\-\}   41.59 \expandafter\addto\csname extras\CurrentOption\endcsname \{\% 41.60 \def\-{\bbl@allowhyphens\discretionary}_-\}_{\}}\bbl@allowhyphens}_{}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

# 42 The Icelandic language

## 42.1 Overview

The file  $iceland.dtx^{50}$  defines all the language definition macros for the Icelandic language

Customization for the Icelandic language was made following several official and semiofficial publications [2, 3, 1, 6, 5]. These publications do not always agree and we indicate those instances.

For this language the character " is made active. In table 17 an overview is given of its purpose. The shorthands in table 17 can also be typeset by using the

```
disable ligature at this position.
" _
           an explicit hyphen sign, allowing hyphenation in the
           rest of the word.
           like "-, but producing no hyphen sign (for compund
           words with hyphen, e.g. x-""y).
ıı ~
           for a compound word mark without a breakpoint.
"=
           for a compound word mark with a breakpoint, allow-
           ing hyphenation in the composing words.
11 6
           for Icelandic left double quotes (looks like ").
11 )

## 42.2 T<sub>E</sub>Xnical details

When this file was read through the option icelandic we make it behave as if icelandic was specified.

```
42.1 \def\bbl@tempa{icelandic}
42.2 \ifx\CurrentOption\bbl@tempa
42.3 \def\CurrentOption{icelandic}
42.4 \fi
```

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
42.5 (*code)
42.6 \LdfInit\CurrentOption{captions\CurrentOption}
```

When this file is read as an option, i.e., by the \usepackage command, icelandic will be an 'unknown' language, so we have to make it known. So we

check for the existence of \lambda@celandic to see whether we have to do something here.

```
42.7 \ifx\l@icelandic\@undefined
42.8 \Onopatterns{Icelandic}
     \adddialect\l@icelandic0
42.9
42.10 \fi
```

\ifCTwoCE We will need a new 'if': \ifCTwoCE is true if and only if  $\LaTeX Z_{\varepsilon}$  is running not in compatibility mode. It is used in the definitions of the command \tala and \upp. The definition is somewhat complicated, due to the fact that \if@compatibility is not recognized as a \if in LATEX-2.09 based formats.

```
42.11 \newif\if@Two@E \@Two@Etrue
42.12 \left( \frac{9FI0{\pi }}{12} \right)
42.13 \ifx\Compatibilitytrue\Cundefined
42.14 \@Two@Efalse \def\@FI@{\relax}
42.15 \else
42.16 \if@compatibility \@Two@Efalse \fi
42.17 \@FI@
```

\extrasicelandic The macro \extrasicelandic will perform all the extra definitions needed for the \noextrasicelandic Icelandic language. The macro \noextrasicelandic is used to cancel the actions of \extrasicelandic.

> For Icelandic the " character is made active. This is done once, later on its definition may vary.

```
42.18 \initiate@active@char{"}
42.19 \@namedef{extras\CurrentOption}{%
     \languageshorthands{icelandic}}
42.21 \expandafter\addto\csname extras\CurrentOption\endcsname{%
42.22 \bbl@activate{"}}
```

Don't forget to turn the shorthands off again.

 $42.23 \verb| addto \verb| noextrasicel and ic{\bbl@deactivate{"}}|$ 

The icelandic hyphenation patterns can be used with \lefthyphenmin and \righthyphenmin set to 2.

```
42.24 \providehyphenmins{\CurrentOption}{\tw0}tw0
```

The code above is necessary because we need an extra active character. This character is then used as indicated in table 18.

To be able to define the function of ", we first define a couple of 'support' macros.

#### 42.3 Captionnames and date

The next step consists of defining the Icelandic equivalents for the LATEX caption-

\captionsicelandic The macro \captionsicelandic will define all strings used used in the four standard document classes provided with LATEX.

```
42.25 \Onamedef{captions\CurrentOption}{%
                                                                                              \def\prefacename{Form\'{a}li}%
42.26
42.27
                                                                                                 \def\refname{Heimildir}%
                                                                                              \label{lem:def_abstractname} $$ \end{abstractname} \footnote{\label{lem:def_abstractname}} $$ \end{abstractname} $$ \end{abstractn
```

```

42.45
42.46
       \def\glossaryname{Or{\dh}alisti}%
42.47 }
```

\dateicelandic The macro \dateicelandic redefines the command \today to produce Icelandic dates.

```
\label{lem:def_date} $$42.48 \left(\frac{%}{2.49} \right)^{\left(\frac{%}{2.50} \right)^{\left(\frac{%}{2.
```

## 42.4 Icelandic quotation marks

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as ".

Now we can define the icelandic and icelandic 'french' quotes. The icelandic 'french' guillemets are the reverse of french guillemets. We define single icelandic 'french' quotes for compatibility. Shorthands are provided for a number of different quotation marks, which make them useable both outside and inside mathmode.

```
42.59 \let\ilq\grq
42.60 \let\irq\grq
42.61 \let\iflq\frq
42.62 \let\ifrq\flq
42.63 \let\ilqq\glqq
42.64 \let\irqq\grqq
42.65 \let\iflqq\frqq
42.66 \let\ifrqq\flqq
42.67 \declare@shorthand{icelandic}{"'}{\glqq}
```

```
42.68 \declare@shorthand{icelandic}{""}{\grqq}
42.69 \declare@shorthand{icelandic}{"">}{\frqq}
42.70 \declare@shorthand{icelandic}{"">}{\frqq}
and some additional commands:
42.71 \declare@shorthand{icelandic}{""-}{\nobreak\-\bbl@allowhyphens}
42.72 \declare@shorthand{icelandic}{""|}{%
42.73 \textormath{\nobreak\discretionary{-}{}{\kern.03em}%
42.74 \bbl@allowhyphens}{}}
42.75 \declare@shorthand{icelandic}{""}{\hskip\z@skip}
42.76 \declare@shorthand{icelandic}{""}{\textormath{\leavevmode\hbox{-}}{-}}}
42.77 \declare@shorthand{icelandic}{""}{\textormath{\leavevmode\hbox{-}}{-}}}
```

## 42.5 Old Icelandic

In old Icelandic some letters have special diacritical marks, described for example in *First Grammatical Treatise* [4, 5]. We provide these in the T1 encoding with the 'ogonek'. The ogonek is placed with the letters 'o', and 'O', '6' and 'É', and 'É'. Shorthands are provided for these as well.

The following code by Leszek Holenderski lifted from polish.dtx is designed to position the diacritics correctly for every font in every size. These macros need a few extra dimension variables.

```
42.78 \newdimen\pl@left
            42.79 \newdimen\pl@down
            42.80 \newdimen\pl@right
            42.81 \newdimen\pl@temp
  \sob The macro \sob is used to put the 'ogonek' in the right place.
            42.82 \def\sob#1#2#3#4#5{%parameters: letter and fractions hl,ho,vl,vo
                             \setbox0\hbox{#1}\setbox1\hbox{\k{}}\setbox2\hbox{p}%
            42.83
            42.84
                             \pl@right=#2\wd0 \advance\pl@right by-#3\wd1

```

## 42.6 Formatting numbers

This section is lifted from frenchb.dtx by D. Flipo. In English the decimal part starts with a point and thousands should be separated by a comma: an approximation of  $1000\pi$  should be inputed as \$3{,}141.592{,}653\$ in mathmode and as 3,141.592,653 in text.

In Icelandic the decimal part starts with a comma and thousands should be separated by a space [1] or by a period [5]; we have the space. The above approximation of  $1000\pi$  should be inputed as \$3\;141{,}592\;653\$ in math-mode and as something like 3~141,592~653 in text. Braces are mandatory around the comma in math-mode, the reason is mentioned in the TEXbook p. 134: the comma is of type \mathpunct (thus normally followed by a space) while the point is of type \mathord (no space added).

Thierry Bouche suggested that a second type of comma, of type \mathord would be useful in math-mode, and proposed to introduce a command (named \decimalsep in this package), the expansion of which would depend on the current language.

Vincent Jalby suggested a command \nombre to conveniently typeset numbers: inputting \nombre{3141,592653} either in text or in math-mode will format this number properly according to the current language (Icelandic or non-Icelandic). We use \nombre to define command \tala in Icelandic.

\tala accepts an optional argument which happens to be useful with the extension 'dcolumn', it specifies the decimal separator used in the *source code*: \newcolumntype{d}{D{,}{\decimalsep}{-1}}}

```
\begin{tabular}{d}\hline
3,14 \\
  \tala[,]{123,4567} \\
  \tala[,]{9876,543}\\hline
\end{tabular}
```

will print a column of numbers aligned on the decimal point (comma or point depending on the current language), each slice of 3 digits being separated by a space or a comma according to the current language.

\decimalsep \thousandsep We need a internal definition, valid in both text and math-mode, for the comma (\@comma@) and another one for the unbreakable fixed length space (no glue) used in Icelandic (\f@thousandsep).

The commands \decimalsep and \thousandsep get default definitions (for the English language) when icelandic is loaded; these definitions will be updated when the current language is switched to or from Icelandic.

```
 42.106 \mathchardef\m@comma="013B \def\@comma@{\ifmmode\m@comma\else,\fi} \\ 42.107 \def\f@thousandsep{\ifmmode\mskip5.5mu\else\penalty\@M\kern.3em\fi} \\ 42.108 \newcommand{\decimalsep}{.} \newcommand{\thousandsep}{\@comma@} \\ 42.109 \expandafter\addto\csname extras\CurrentOption\endcsname{%} \\ 42.110 \def\thousandsep{\f@thousandsep}} \\ 42.111 \def\thousandsep{\f@thousandsep}} \\ 42.112 \expandafter\addto\csname noextras\CurrentOption\endcsname{%} \\ 42.113 \def\thousandsep{\gcmma@}} \\ 42.114 \def\thousandsep{\gcmma@}}
```

\tala The decimal separator used when inputing a number with \tala has to be a comma. \tala splits the inputed number into two parts: what comes before the first comma will be formatted by \@integerpart while the rest (if not empty) will be formatted by \@decimalpart. Both parts, once formatted separately will be merged together with between them, either the decimal separator \decimalsep or (in  $\text{ETFX} 2_{\mathcal{E}}$  only) the optional argument of \tala.

```
42.115 \setminus if@Two@E
       \newcommand{\tala}[2][\decimalsep]{%
42.116
                \def\@decimalsep{#1}\@tala#2\@empty,\@empty,\@nil}
42.117
42.118 \else
42.119
        \newcommand{\tala}[1]{%
               \def\@decimalsep{\decimalsep}\@tala#1\@empty,\@empty,\@nil}
42.120
42.121 \fi
42.122 \def\@tala#1,#2,#3\@nil{%
42.123
             \ifx\@empty#2%
               \@integerpart{#1}%
42.124
42.125
             \else
                \@integerpart{#1}\@decimalsep\@decimalpart{#2}%
42 126
42.127
             \fi}
```

The easiest bit is the decimal part: We attempt to read the first four digits of the decimal part, if it has less than 4 digits, we just have to print them, otherwise \thousandsep has to be appended after the third digit, and the algorithm is applied recursively to the rest of the decimal part.

Formatting the integer part is more difficult because the slices of 3 digits start from the *bottom* while the number is read from the top! This (tricky) code is borrowed from David Carlisle's comma.stv.

```
42.134 \def\@integerpart#1{\@@integerpart{}#1\@empty\@empty}
42.135 \def\@@integerpart#1#2#3#4{%
        \ifx\ensuremath{\mbox{Qempty#2\%}}
42.136
42.137
          \@addthousandsep#1\relax
42.138
        \else
           \ifx\@empty#3%
42.139
             \@addthousandsep\@empty\@empty#1#2\relax
42.140
          \else
42.141
42.142
             \ifx\ensuremath{\mbox{Qempty}\#4\%}
42.143
               \@addthousandsep\@empty#1#2#3\relax
42 144
             \else
               \@@integerpartafterfi{#1#2#3#4}%
42 145
             \fi
42.146
          \fi
42.147
42.148
42.149 \def\@@integerpartafterfi#1\fi\fi\fi\fi\fi\fi\\fi\@@integerpart{#1}}
42.150 \det @addthousandsep#1#2#3#4{#1#2#3%
42.151
        \if#4\relax
42.152
        \else
```

```
42.153 \thousandsep\expandafter\@addthousandsep\expandafter#4% 42.154 \fi}
```

## 42.7 Extra utilities

We now provide the Icelandic user with some extra utilities.

\upp \upp is for typesetting superscripts. \upp relies on

\upp@size The internal macro \upp@size holds the size at which the superscript will be typeset. The reason for this is that we have to specify it differently for different formats.

```
42.155 \ifx\sevenrm\Qundefined
42.156 \ifx\Qptsize\Qundefined
42.157 \let\upp\Qsize\small
42.158 \else
42.159 \ifx\selectfont\Qundefined
```

In this case the format is the original LATEX-2.09:

```
42.160 \ifcase\@ptsize

42.161 \let\upp@size\ixpt\or

42.162 \let\upp@size\xpt\or

42.163 \let\upp@size\xipt

42.164 \fi
```

When \selectfont is defined we probably have NFSS available:

```
42.165
          \else
42.166
            \ifcase\@ptsize
42.167
              \def\upp@size{\fontsize\@ixpt{10pt}\selectfont}\or
42.168
              \def\upp@size{\fontsize\@xpt{11pt}\selectfont}\or
42.169
              \def\upp@size{\fontsize\@xipt{12pt}\selectfont}
            \fi
42.170
          \fi
42.171
42.172
       \fi
42.173 \else
```

If we end up here it must be a plain based TEX format, so:

```
42.174 \let\upp@size\sevenrm
42.175 \fi
```

Now we can define \upp. When  $\LaTeX 2_{\varepsilon}$  runs in compatibility mode ( $\LaTeX 2.09$  emulation), \textsuperscript is also defined, but does no good job, so we give two different definitions for \upp using \ifGTwoGE.

Some definitions for special characters. \grada needs a special treatment: it is \char6 in T1-encoding and \char23 in OT1-encoding.

```
42.182 \ifx\fmtname\LaTeXeFmtName
42.183 \DeclareTextSymbol{\grada}{T1}{6}
42.184 \DeclareTextSymbol{\grada}{0T1}{23}
```

```
42.185 \else
42.186 \def\T@one{T1}
42.187 \ifx\f@encoding\T@one
42.188 \newcommand{\grada}{\char6}
42.189 \else
42.190 \newcommand{\grada}{\char23}
42.191 \fi
42.192 \fi
```

\gradur Macro for typesetting the abbreviation for 'degrees' (as in 'degrees Celsius'). As the bounding box of the character 'degree' has very different widths in CMR/DC and PostScript fonts, we fix the width of the bounding box of \gradur to 0.3 em, this lets the symbol 'degree' stick to the preceding (e.g., 45\gradur) or following character (e.g., 20~\gradur C).

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
42.195 \label{ldf@finish}\currentOption 42.196 \label{ldfQfinish}
```

# 43 The Norwegian language

The file norsk.dtx<sup>51</sup> defines all the language definition macros for the Norwegian language as well as for an alternative variant 'nynorsk' of this language.

For this language the character " is made active. In table 19 an overview is given of its purpose.

- "ff for ff to be hyphenated as ff-f, this is also implemented for b, d, f, g, l, m, n, p, r, s, and t. (o"ppussing)
- "ee Hyphenate "ee as \'e-e. (komit"een)
- '- an explicit hyphen sign, allowing hyphenation in the composing words. Use this for compound words when the hyphenation patterns fail to hyphenate properly. (alpin"-anlegg)
- "| Like "-, but inserts 0.03em space. Use it if the compound point is spanned by a ligature. (hoff"|intriger)
- "" Like "-, but producing no hyphen sign. (i""g\aa{}r)
- "~ Like -, but allows no hyphenation at all. (E"~cup)
- "= Like -, but allowing hyphenation in the composing words. (marksistisk"=leninistisk)
- "
  for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).

Table 19: The extra definitions made by norsk.sty

Rune Kleveland distributes a Norwegian dictionary for ispell (570000 words). It can be found at http://www.uio.no/~runekl/dictionary.html.

This dictionary supports the spellings spi"sslede for 'spisslede' (hyphenated spiss-slede) and other such words, and also suggest the spelling spi"sslede for 'spisslede' and 'spissslede'.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

43.1 (\*code)

## 43.2 \LdfInit\CurrentOption{captions\CurrentOption}

When this file is read as an option, i.e. by the \usepackage command, norsk will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lambda@norsk to see whether we have to do something here.

- $43.3 \ifx\loop norsk\over 100 morsk\over 100 mors$
- 43.4 \@nopatterns{Norsk}
- 43.5 \adddialect\l@norsk0\fi

 $\n$ norskhyphenmins

Some sets of Norwegian hyphenation patterns can be used with \lefthyphenmin set to 1 and \righthyphenmin set to 2, but the most common set nohyph.tex can't. So we use \lefthyphenmin=2 by default.

## $43.6 \providehyphenmins{\CurrentOption}{\tw@}$

<sup>51</sup>The file described in this section has version number v2.0h and was last revised on 2005/03/30. Contributions were made by Haavard Helstrup (HAAVARD@CERNVM) and Alv Kjetil Holme (HOLMEA@CERNVM); the 'nynorsk' variant has been supplied by Per Steinar Iversen iversen@vxcern.cern.ch) and Terje Engeset Petterst (TERJEEP@VSFYS1.FI.UIB.NO); the shorthand definitions were provided by Rune Kleveland (runekl@math.uio.no).

Now we have to decide which version of the captions should be made available. This can be done by checking the contents of \CurrentOption.

```
43.7 \def\bbl@tempa{norsk}
43.8 \ifx\CurrentOption\bbl@tempa
```

The next step consists of defining commands to switch to (and from) the Norwegian language.

\captionsnorsk The macro \captionsnorsk defines all strings used in the four standard documentclasses provided with LATEX.

```
\def\captionsnorsk{%
 43.9

         \def\glossaryname{Ordliste}%
43.57
         }
43.58
43.59 \fi
```

\datenorsk The macro \datenorsk redefines the command \today to produce Norwegian dates.

```
43.60 \@namedef{date\CurrentOption}{%
43.61 \def\today{\number\day.^\ifcase\month\or
43.62 januar\or februar\or mars\or april\or mai\or juni\or
43.63 juli\or august\or september\or oktober\or november\or desember
43.64 \fi
43.65 \space\number\year}}
```

\extrasnorsk The macro \extrasnorsk will perform all the extra definitions needed for the \extrasnynorsk Norwegian language. The macro \noextrasnorsk is used to cancel the actions of \extrasnorsk.

Norwegian typesetting requires \frencspacing to be in effect.

```
43.66 \enskip \enski
```

For Norsk the " character is made active. This is done once, later on its definition may vary.

```
43.68 \initiate@active@char{"}
43.69 \expandafter\addto\csname extras\CurrentOption\endcsname{%
43.70 \languageshorthands{norsk}}
43.71 \expandafter\addto\csname extras\CurrentOption\endcsname{%
43.72 \bbl@activate{"}}

Don't forget to turn the shorthands off again.
```

Don't forgot to tain the phoreinanas on again.

The code above is necessary because we need to define a number of shorthand commands. These sharthand commands are then used as indicated in table 19.

To be able to define the function of ", we first define a couple of 'support' macros.

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as ".

```
43.75 \begingroup \catcode '\"12

43.76 \def\x{\endgroup}

43.77 \def\@SS{\mathchar"7019 }

43.78 \def\dq{"}}

43.79 \x
```

Now we can define the discretionary shorthand commands. The number of words where such hyphenation is required is for each character

```
b d f g k l n p r s t
4 4 15 3 43 30 8 12 1 33 3
```

taken from a list of 83000 ispell-roots.

```
43.80 \end{norsk} {\begin{tabular}{l} 43.80 \end{tabular}} \end{norsk} {\begin{tabular}{l} blue \end{tabular}} \end{tabular} \
     43.81 \end{areQshorthand{norsk}{"B}{\text{textormath}{bblQdisc B{BB}}{B}}}
     43.82 \ \ declare@shorthand{norsk}{"d}{\text{textormath}}{\bbl@disc\ d{dd}}{d}}
     43.84 \declare@shorthand{norsk}{"e}{\textormath{\bbl@disc e{\'e}}{}}
     43.85 \ \end{are@shorthand{norsk}{"E}{\operatorname{textormath}(bbl@disc E{\'E})}}
     43.86 \declare@shorthand{norsk}{"F}{\textormath{\bbl@disc F{FF}}{F}}
     43.87 \declare@shorthand{norsk}{"g}{\textormath{\bbl@disc g{gg}}{g}}
     43.88 \declare@shorthand{norsk}{"G}{\text{textormath}}{bbl@disc G{GG}}{G}}
     43.89 \declare@shorthand{norsk}{"k}{\textormath{\bl@disc k{kk}}{k}}
     43.90 \ \c) \ \K{KK}}{K}
    43.91 \declare@shorthand{norsk}{"1}{\text{\textormath}(bbl@disc 1{11})}{1}}
    43.92 \end{are@shorthand{norsk}{"L}{\text{\commath}{\bbl@disc L{LL}}{L}}}
    43.93 \declare@shorthand{norsk}{"n}{\textormath{\bbl@disc\ n{nn}}{n}}
    43.94 \declare@shorthand{norsk}{"N}{\textormath{\bbl@disc\ N{NN}}}{N}}
    43.95 \declare@shorthand{norsk}{"p}{\textormath{\bbl@disc p{pp}}{p}}
    43.96 \declare@shorthand{norsk}{"P}{\textormath{\bbl@disc\ P{PP}}{P}}
     43.97 \declare@shorthand{norsk}{"r}{\textormath{\bbl@disc r{rr}}{r}}
     43.98 \declare@shorthand{norsk}{"R}{\textormath{\bl@disc R{RR}}{R}}
    43.99 \declare@shorthand{norsk}{"s}{\textormath{\bbl@disc s{ss}}{s}}
43.100 \declare@shorthand{norsk}{"S}{\textormath{\bbl@disc S{SS}}{S}}
43.101 \end{norsk} {\tt "t} {\tt textormath} {\tt bbl@disc~t\{tt\}} {\tt tt} {\tt 
43.102 \label{lem:condition} \begin{tabular}{l} $43.102 \label{lem:condition} $43.102 \label{l
```

We need to treat "f a bit differently in order to preserve the ff-ligature.

We now define the French double quotes and some commands concerning hyphenation:

```
 43.111 \ declare@shorthand{norsk}{"<} \{flqq\} \\ 43.112 \ declare@shorthand{norsk}{">} \{frqq\} \\ 43.113 \ declare@shorthand{norsk}{"-} \{penalty\@M\-\bbl@allowhyphens\} \\ 43.114 \ declare@shorthand{norsk}{"|} {% \\ 43.115 \ \textormath{\penalty\@M\discretionary{-}} {\kern.03em}% \\ 43.116 \ \ \allowhyphens} {}\} \\ 43.117 \ declare@shorthand{norsk}{""} {\hskip\z@skip} \\ 43.118 \ declare@shorthand{norsk}{""} {\textormath{\leavevmode\hbox{-}}} {}\} \\ 43.119 \ \declare@shorthand{norsk}{""} {\textormath{\leavevmode\hbox{-}}} {}\} \\ 43.119 \ \declare@shorthand{norsk} {""} {\textormath{\coskip}} \\ 43.119 \ \declare@shorthand{norsk} {""} {\textormath{\coskip}} \\ 43.119 \ \declare@shorthand{norsk} {""} {\textormath{\coskip}} \\ 43.119 \ \declare@shorthand{norsk} {\coskip} \\ 43.119 \
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

 $43.120 \label{eq:currentOption} \\ 43.121 \end{code}$ 

### 44 The Swedish language

The file swedish.dtx<sup>52</sup> defines all the language-specific macros for the Swedish language. This file has borrowed heavily from finnish.dtx and germanb.dtx.

For this language the character " is made active. In table 20 an overview is given of its purpose. The vertical placement of the "umlaut" in some letters can be controlled this way.

- "a Gives  $\ddot{a}$ , also implemented for "A, "o and "0. "w, "W gives  $\mathring{a}$  and  $\mathring{A}$ .
- "ff for ff to be hyphenated as ff-f. Used for compound words, such as stra"ffånge, which should be hyphenated as straff-fånge. This is also implemented for b, d, f, g, l, m, n, p, r, s, and t.
- "| disable ligature at this position. This should be used for compound words, such as "stra"ffinrättning", which should not have the ligature "ffi".
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word, such as e. g. in "x"-axeln".
- "" like "-, but producing no hyphen sign (for words that should break at some sign such as och/""eller).
- "~ for an explicit hyphen without a breakpoint; useful for expressions such as "2"~3 veckor" where no line-break is desirable.
- "= an explicit hyphen sign allowing subsequent hyphenation, for expressions such as "studiebidrag och -lån".
- \- like the old \-, but allowing hyphenation in the rest of the word.

Table 20: The extra definitions made by swedish.sty

Two variations for formatting of dates are added. \datesymd makes \today output dates formatted as YYYY-MM-DD, which is commonly used in Sweden today. \datesdmy formats the date as D/M YYYY, which is also very common in Sweden. These commands should be issued after \begindocument.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

### 44.1 **(\*code)**

### 

When this file is read as an option, i.e. by the \usepackage command, swedish will be an 'unknown' language in which case we have to make it known. So we check for the existence of \l@swedish to see whether we have to do something here.

### 44.3 \ifx\l@swedish\@undefined 44.4 \@nopatterns{Swedish}

 $<sup>^{52}\</sup>mathrm{The}$  file described in this section has version number v2.3d and was last revised on 2005/03/31. Contributions were made by Sten Hellman (HELLMAN@CERNVM.CERN.CH) and Erik Östhols (erik\_osthols@yahoo.com).

#### 44.5 \adddialect\l@swedish0\fi

The next step consists of defining commands to switch to the Swedish language. The reason for this is that a user might want to switch back and forth between languages.

\captionsswedish The macro \captionsswedish defines all strings used in the four standard document classes provided with LATEX.

```
44.6 \addto\captionsswedish{%
      \def\prefacename{F\"orord}%
44 7
      \def\refname{Referenser}%
44.8
      \def\abstractname{Sammanfattning}%
44.9
44.10
      \def\bibname{Litteraturf\"orteckning}%
44.11
      \def\chaptername{Kapitel}%
      \def\appendixname{Bilaga}%
44.12
      44.13
      \def\listfigurename{Figurer}%
44 14
      \def\listtablename{Tabeller}%
44 15
      \def\indexname{Sakregister}%
44.16
44.17
      \def\figurename{Figur}%
44.18
      \def\tablename{Tabell}%
44.19
      \def\partname{Del}%
      \def\enclname{Bil.}%
44.20
      \def\ccname{Kopia f\"or k\"annedom}%
44.21
44.22
      \def\headtoname{Till}% in letter
      \def\pagename{Sida}%
44.23
      \def\seename{se}%
44.24
44.25
      \def\alsoname{se \"aven}%
      \def\proofname{Bevis}%
44.26
      \def\glossaryname{Ordlista}%
44.27
44.28
```

\dateswedish The macro \dateswedish redefines the command \today to produce Swedish dates

```
44.29 \def\dateswedish{%
44.30 \def\today{%
44.31 \number\day~\ifcase\month\or
44.32 januari\or februari\or mars\or april\or maj\or juni\or
44.33 juli\or augusti\or september\or oktober\or november\or
44.34 december\fi
44.35 \space\number\year}}
```

\datesymd The macro \datesymd redefines the command \today to produce dates in the format YYYY-MM-DD, common in Sweden.

\datesdmy The macro \datesdmy redefines the command \today to produce Swedish dates in the format DD/MM YYYY, also common in Sweden.

The swedish hyphenation patterns can be used with \lefthyphenmin set to 2 and \swedishhyphenmins \righthyphenmin set to 2.

 $44.42 \text{providehyphenmins{swedish}{} \text{tw@} \text{tw@}}$ 

\extrasswedish The macro \extrasswedish performs all the extra definitions needed for the \noextrasswedish Swedish language. The macro \noextrasswedish is used to cancel the actions of \extrasswedish.

> For Swedish texts \frenchspacing should be in effect. We make sure this is the case and reset it if necessary.

```
44.43 \addto\extrasswedish{\bbl@frenchspacing}
44.44 \addto\noextrasswedish{\bbl@nonfrenchspacing}
```

For Swedish the "character is made active. This is done once, later on its definition may vary.

```
44.45 \initiate@active@char{"}
44.46 \addto\extrasswedish{\languageshorthands{swedish}}
44.47 \addto\extrasswedish{\bbl@activate{"}}
```

Don't forget to turn the shorthands off again.

```
44.48 \addto\noextrasswedish{\bbl@deactivate{"}}
```

The "umlaut" accent macro \" is changed to lower the "umlaut" dots. The redefinition is done with the help of \umlautlow.

```
44.49 \addto\extrasswedish{\babel@save\"\umlautlow}
44.50 \addto\noextrasswedish{\umlauthigh}
```

The code above is necessary because we need an extra active character. This character is then used as indicated in table 20.

To be able to define the function of ", we first define a couple of 'support'

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as ".

```
44.51 \begingroup \catcode \"12
44.52 \left( x_{\text{endgroup}} \right)
44.53 \ \def\ensuremath{\mathchar}\ \
44.54
       \def\dq{"}
44.55 \x
```

Now we can define the doublequote macros: the umlauts and å.

```
44.56 \declare@shorthand{swedish}{"w}{\textormath{{\aa}\allowhyphens}{\ddot w}}
44.57 \declare@shorthand{swedish}{"a}{\text{\ }}{\ a}llowhyphens}{\dot a}
44.58 \verb|\declare@shorthand{swedish}{"o}{\text{textormath}{"o}}{\text{allowhyphens}}{\text{ddot o}}{}
44.59 \declare@shorthand\{swedish\}{"W}{\textormath}{\{\AA}\allowhyphens}{\ddot W}}
44.60 \end{swedish}{"A}{\text{Lextormath}}{"A}\allowhyphens}{\dot A}}
44.61 \end{swedish} {"0} {\texttt{v}} allowhyphens} {\texttt{d}} 0} 
  discretionary commands
44.62 \declare@shorthand{swedish}{"b}{\textormath{\bbl@disc b{bb}}{b}}
```

```
44.63 \declare@shorthand{swedish}{"B}{\textormath{\bl@disc B{BB}}{B}}
44.64 \end{swedish} {\end{swedish} {\end{swedish}
44.66 \ \ declare@shorthand{swedish}{"f}{\text{textormath}}{\text{bbl@disc } f{ff}}{f}}
```

```
44.67 \ \ensuremath{\hlobl@disc} F{FF}}{F}
44.68 \enskip {\enskip} 
 44.69 \end{swedish} {\tt "G} {\tt textormath} {\tt bbl@disc~G\{GG\}} {\tt G} {\tt oblock} {\tt obloc
 44.70 \declare@shorthand{swedish}{"1}{\text{textormath}}{bbl@disc 1}{11}}{1}}
 44.73 \end{swedish} {\end{swedish} {\end{swedish} {\end{swedish} } {\end{swedish} } {\end{swedish} {\end{swedish} } {\end{swedish} {\end{swedish} } {\end{swedish} } {\end{swedish} } {\end{swedish} } {\end{swedish} {\end{swedish} } {\end{swedish} } {\end{swedish} } {\end{swedish} } {\end{swedish} } {\end{swedish} {\end{swedish} } {\end{swedish} 
  44.74 \declare@shorthand{swedish}{"n}{\textormath{\bbl@disc n{nn}}{n}}
 44.76 \declare@shorthand{swedish}{"p}{\texttextormath}{\bbl@disc p{pp}}{p}}
 44.78 \end{swedish} {\tt "r} {\tt textormath} {\tt bbl@disc\ r\{rr\}} {\tt r} {\tt textormath} {\tt bbl@disc\ r\{rr\}} {\tt r} {\tt 
 44.81 \declare@shorthand{swedish}{"S}{\textormath{\bbl@disc S{SS}}{S}}
 44.82 \ensuremath{\hobl@disc\ t{tt}}{tt}}
 44.83 \end{swedish} {\tt "T} {\tt textormath} {\tt bbl@disc\ T{TT}} {\tt T} {\tt textormath} {\tt bbl@disc\ T{TT}} {\tt T} {\tt T} {\tt textormath} {\tt textor
                 and some additional commands:
 44.84 \declare@shorthand{swedish}{"-}{\nobreak-\bbl@allowhyphens}
 44.85 \declare@shorthand{swedish}{"|}{%
 44 86
                                            \textormath{\nobreak\discretionary{-}{}{\kern.03em}%
                                                                                                                                       \bbl@allowhyphens}{}}
  44.88 \declare@shorthand{swedish}{""}{\hskip\z@skip}
  44.89 \declare@shorthand{swedish}{"~}{%
 44.91 \declare@shorthand{swedish}{"=}{\hbox{-}}\allowhyphens}
```

\- Redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TEX in this respect is very unfortunate for languages such as Dutch, Finnish, German and Swedish, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation position on top of the ones that TEX can generate from the hyphenation patterns.

```
 44.92 \add to \extrasswed is h{\def}-{\allowhyphens} \\ 44.94 \discretionary{-}{}{\allowhyphens}}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
44.95 \ldf@finish{swedish} 44.96 \cde
```

# 45 The North Sami language

The file samin.dtx<sup>53</sup> defines all the language definition macros for the North Sami language.

Several Sami dialects/languages are spoken in Finland, Norway, Sweden and on the Kola Peninsula (Russia). The alphabets differ, so there will eventually be a need for more .dtx files for e.g. Lule and South Sami. Hence the name samin.dtx (and not sami.dtx or the like) in the North Sami case.

There are currently no hyphenation patterns available for the North Sami language, but you might consider using the patterns for Finnish (fi8hyph.tex), Norwegian (nohyph.tex) or Swedish (sehyph.tex). Add a line for the samin language to the language.dat file, and rebuild the LATEX format file. See the documentation for your LATEX distribution.

A note on writing North Sami in LATEX: The TI encoding and EC fonts do not include the T WITH STROKE letter, which you will need a workaround for. My suggestion is to place the lines

```
\newcommand{\txx}{\mbox{t\hspace{-.35em}-}}
\newcommand{\txx}{\mbox{T\hspace{-.5em}-}}
in the preamble of your documents. They define the commands
\txx{} for LATIN CAPITAL LETTER T WITH STROKE and
\tx{} for LATIN SMALL LETTER T WITH STROKE.
```

### 45.1 The code of samin.dtx

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
45.1 \langle *code \rangle
45.2 \LdfInit{samin}{captionssamin}
```

When this file is read as an option, i.e. by the \usepackage command, samin could be an 'unknown' language in which case we have to make it known. So we check for the existence of \losamin to see whether we have to do something here.

```
45.3 \ifx\undefined\l@samin
45.4 \@nopatterns{Samin}
45.5 \adddialect\l@samin0\fi
```

The next step consists of defining commands to switch to (and from) the North Sami language.

\saminhyphenmins This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

 $45.6 \verb|\providehyphenmins{samin}{{\sf tw@} tw@}$ 

\captionssamin The macro \captionssamin defines all strings used in the four standard document classes provided with IATEX.

```
45.7 \def\captionssamin{%
45.8 \def\prefacename{Ovdas\'atni}%
45.9 \def\refname{\v Cujuhusat}%
45.10 \def\abstractname{\v Coahkk\'aigeassu}%
```

<sup>53</sup>The file described in this section has version number v1.0c and was last revised on 2004/02/20. It was written by Regnor Jernsletten, (Regnor.Jernsletten@sami.uit.no) or (Regnor.Jernsletten@eunet.no).

```

         \space\number\day.~b.\space\number\year}%
45.45 }%
```

\extrassamin The macro \extrassamin will perform all the extra definitions needed for the \noextrassamin North Sami language. The macro \noextrassamin is used to cancel the actions of \extrassamin. For the moment these macros are empty but they are defined for compatibility with the other language definition files.

```
45.46 \addto\extrassamin{}
45.47 \addto\noextrassamin{}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
45.48 \ldf@finish{samin}
45.49 (/code)
```

### 46 The Finnish language

The file  $finnish.dtx^{54}$  defines all the language definition macros for the Finnish language.

For this language the character " is made active. In table 21 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "= an explicit hyphen sign for expressions such as "pakastekaapit ja -arkut".
- "" like "-, but producing no hyphen sign (for words that should break at some sign such as "entrada/salida."
- "' lowered double left quotes (looks like ")
- "' normal double right quotes
- "
  for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).
- \- like the old \-, but allowing hyphenation in the rest of the word.

Table 21: The extra definitions made by finnish.ldf

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
46.1 \; \langle *code \rangle \\ 46.2 \; \label{eq:code} \\ 46.2 \; \label{eq:code} \\ \label{eq:code}
```

When this file is read as an option, i.e. by the \usepackage command, finnish will be an 'unknown' language in which case we have to make it known. So we check for the existence of \loginish to see whether we have to do something here.

```
46.3 \ifx\l@finnish\@undefined
46.4 \@nopatterns{Finnish}
46.5 \adddialect\l@finnish0\fi
```

The next step consists of defining commands to switch to the Finnish language. The reason for this is that a user might want to switch back and forth between languages.

\captionsfinnish The macro \captionsfinnish defines all strings used in the four standard documentclasses provided with LATEX.

```
46.6 \addto\captionsfinnish{%
46.7 \def\prefacename{Esipuhe}%
46.8 \def\refname{Viitteet}%
46.9 \def\abstractname{Tiivistelm\"a}
46.10 \def\bibname{Kirjallisuutta}%
46.11 \def\chaptername{Luku}%
46.12 \def\appendixname{Liite}%
```

 $<sup>^{54}\</sup>mathrm{The}$  file described in this section has version number v1.3q and was last revised on 2007/10/20. A contribution was made by Mikko KANERVA (KANERVA@CERNVM) and Keranen Reino (KERANEN@CERNVM).

```
/* Could be "Sis\"allys" as well */
      \def\contentsname{Sis\"alt\"o}%

46.22
      \def\pagename{Sivu}%
46.23
      \def\seename{katso}%
46.24
      46.25
      \def\proofname{Todistus}%
46.26
46.27
      \def\glossaryname{Sanasto}%
46.28
```

\datefinnish The macro \datefinnish redefines the command \today to produce Finnish

```
46.29 \def\datefinnish{%
      \def\today{\number\day.~\ifcase\month\or
         tammikuuta\or helmikuuta\or maaliskuuta\or huhtikuuta\or
46.32
         toukokuuta\or kes\"akuuta\or hein\"akuuta\or elokuuta\or
46.33
         syyskuuta\or lokakuuta\or marraskuuta\or joulukuuta\fi
46.34
        \space\number\year}}
```

\noextrasfinnish

\extrasfinnish Finnish has many long words (some of them compound, some not). For this reason hyphenation is very often the only solution in line breaking. For this reason the values of \hyphenpenalty, \exhyphenpenalty and \doublehyphendemerits should be decreased. (In one of the manuals of style Matti Rintala noticed a paragraph with ten lines, eight of which ended in a hyphen!)

Matti Rintala noticed that with these changes TEX handles Finnish very well, although sometimes the values of \tolerance and \emergencystretch must be increased. However, I don't think changing these values in finnish.ldf is appropriate, as the looseness of the font (and the line width) affect the correct choice of these parameters.

```
46.35 \addto\extrasfinnish{%
                                                \babel@savevariable\hyphenpenalty\hyphenpenalty=30%
 46.36
                                                \begin{tabular}{l} \begin{tabu
46.37
                                               \verb|\babel@savevariable| double hyphen demerits \verb|\double hyphen demerits| \\
46.38
                                               \babel@savevariable\finalhyphendemerits\finalhyphendemerits=5000%
46.39
46.40
 46.41 \addto\noextrasfinnish{}
```

Another thing \extrasfinnish needs to do is to ensure that \frenchspacing is in effect. If this is not the case the execution of \noextrasfinnish will switch it of again.

```
46.42 \addto\extrasfinnish{\bbl@frenchspacing}
46.43 \addto\noextrasfinnish{\bbl@nonfrenchspacing}
```

For Finnish the "character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the finnish group of shorthands should be used.

```
46.44 \initiate@active@char{"}
46.45 \addto\extrasfinnish{\languageshorthands{finnish}}
  Don't forget to turn the shorthands off again.
46.46 \addto\extrasfinnish{\bbl@activate{"}}
46.47 \addto\noextrasfinnish{\bbl@deactivate{"}}
     The 'umlaut' character should be positioned lower on all vowels in Finnish
46.48 \addto\extrasfinnish{\umlautlow\umlautelow}
46.49 \addto\noextrasfinnish{\umlauthigh}
     First we define access to the low opening double quote and guillemets for
  quotations,
46.50 \declare@shorthand{finnish}{"'}{%
     \textormath{\quotedblbase}{\mbox{\quotedblbase}}}
46.52 \ensuremath{\mbox{declare@shorthand{finnish}{\"'}}{\mbox{\"'}}}
     \textormath{\textquotedblright}{\mbox{\textquotedblright}}}
46.54 \declare@shorthand{finnish}{"<}{%
      \textormath{\guillemotleft}{\mbox{\guillemotleft}}}
46.56 \declare@shorthand{finnish}{">}{%
     \textormath{\guillemotright}{\mbox{\guillemotright}}}
  then we define two shorthands to be able to specify hyphenation breakpoints that
  behave a little different from \setminus-.
46.58 \ \ declare@shorthand{finnish}{"-}{\ \ nobreak-\ \ bbl@allowhyphens}
46.59 \declare@shorthand{finnish}{""}{\hskip}z@skip}
And we want to have a shorthand for disabling a ligature.
46.61 \declare@shorthand{finnish}{"|}{%
      \textormath{\discretionary{-}{}{\kern.03em}}{}}
```

\- All that is left now is the redefinition of \-. The new version of \- should indicate an extra hyphenation position, while allowing other hyphenation positions to be generated automatically. The standard behaviour of TeX in this respect is very unfortunate for languages such as Dutch, Finnish and German, where long compound words are quite normal and all one needs is a means to indicate an extra hyphenation position on top of the ones that TeX can generate from the hyphenation patterns.

```
\label{lowhyphens} $$46.63 \addto\extrasfinnish{\def'-{\bbl@allowhyphens}}$$ $$46.65 $$ \discretionary{-}{}{\bbl@allowhyphens}$$
```

\finishhyphenmins

The finnish hyphenation patterns can be used with \lefthyphenmin set to 2 and \righthyphenmin set to 2.

```
46.66 \text{providehyphenmins}(CurrentOption}{\text{tw@}tw@}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
46.67 \label{df:finish} $46.68 \label{df:finish}$
```

### 47 The Hungarian language

The file option magyar.dtx defines all the language definition macros for the Hungarian language.

The babel support for the Hungarian language until file version 1.3i was essentially changing the English document elements to Hungarian ones, but because of the differences between these too languages this was actually unusable ('Part I' was transferred to 'Rész I' which is not usable instead of 'I. rész'). To enhance the typesetting facilities for Hungarian the following should be considered:

- In Hungarian documents there is a period after the part, section, subsection etc. numbers.
- In the part, chapter, appendix name the number (or letter) goes before the name, so 'Part I' translates to 'I. rész'.
- The same is true with captions ('Table 2.1' goes to '2.1. táblázat').
- There is a period after the caption name instead of a colon. ('Table 2.1:' goes to '2.1. táblázat.')
- There is a period at the end of the title in a run-in head (when afterskip<0 in \@startsection).
- Special hyphenation rules must be applied for the so-called long double consonants (ccs, ssz,...).
- The opening quotation mark is like the German one (the closing is the same as in English).
- In Hungarian figure, table, etc. referencing a definite article is also incorporated. The Hungarian definite articles behave like the English indefinite ones ('a/an'). 'a' is used for words beginning with a consonant and 'az' goes for a vowel. Since some numbers begin with a vowel some others with a consonant some commands should be provided for automatic definite article generation.

Until file version  $1.3i^{55}$  the special typesetting rules of the Hungarian language mentioned above were not taken into consideration. This version  $(v1.4j)^{56}$  enables babel to typeset 'good-looking' Hungarian texts.

 $\ontoday$ 

The \ontoday command works like \today but produces a slightly different date format used in expressions such as 'on February 10th'.

\Az

The commands  $\Delta z = 1$  and z = 1 write the correct definite article for the argument and the argument itself (separated with a  $\tilde{a}$ ). The star-forms ( $\Delta z = 1$ ) produce the article only.

\Azr

 $\Delta zr#1$  and  $\vec r@#1$  treat the argument as a label so expand it then write the definite article for  $\vec r@#1$ , a non-breakable space then the label expansion. The star-forms do not print the label expansion.  $\Delta zr(#1 \text{ and } \vec r@#1 \text{ are used for equation referencing with the syntax } \vec r@#1$ .

\Aref

There are two aliases \Aref and \aref for \Azr and \azr, respectively.

<sup>55</sup> That file was last revised on 1996/12/23 with a contribution by the next authors: Attila Koppányi (attila@cernvm.cern.ch), Árpád Bíró (JZP1104@HUSZEG11.bitnet), István Hamecz (hami@ursus.bke.hu) and Dezső Horváth (horvath@pisa.infn.it).

<sup>&</sup>lt;sup>56</sup>It was written by József Bérces (jozsi@docs4.mht.bme.hu) with some help from Ferenc Wettl (wettl@math.bme.hu) and an idea from David Carlisle (david@dcarlisle.demon.co.uk).

shortcut	explanation	example
"	same as \glqq in babel, or	''id\'ezet''—→"idézet''
	\quotedblbase in T1 (open-	
	ing quotation mark, like ")	
'с, 'С	ccs is hyphenated as cs-cs	loʻccsan $\longrightarrow$ locs-csan
'd, 'D	ddz is hyphenated as dz-dz	e'ddz∖"unkedz-dzünk
'g, 'G	ggy is hyphenated as gy-gy	poʻggy∖'asz—→pogy-gyász
'1, 'L	lly is hyphenated as ly-ly	Kod∖'a'llyal—→Kodály-lyal
'n, 'N	nny is hyphenated as ny-ny	me'nnyei →meny-nyei
's, 'S	ssz is hyphenated as sz-sz	vi'ssza $\longrightarrow$ v $\mathrm{isz} ext{-}\mathrm{sza}$
't, 'T	tty is hyphenated as ty-ty	$\mathtt{po'ttyan} {\longrightarrow} \mathrm{poty-tyan}$
ʻz, ʻZ	zzs is hyphenated as zs-zs	ri'zzsel—→rizs-zsel

Table 22: The shortcuts defined in magyar.ldf

During the preparation of a document it is not known in general, if the code 'a~\ref{label}' or the code 'az~\ref{label}' is the grammatically correct one. Writing '\aref{label}' instead of the previous ones solves the problem.

 $\Azp$ 

\Azp#1 and \azp#1 also treat the argument as a label but use the label's page for definite article determination. There are star-forms giving only the definite article without the page number.

\Apageref

There are aliases  $\Apageref$  and  $\apageref$  for  $\Azp$  and  $\azp$ , respectively. The code  $\apageref\{label\}$  is equivalent either to  $\arangeref\{label\}$  or to  $\arangeref\{label\}$ .

\Azc

\Azc and \azc work like the \cite command but (of course) they insert the definite article. There can be several comma separated cite labels and in that case the definite article is given for the first one. They accept \cite's optional argument. There are star-forms giving the definite article only.

\Acite

There are aliases \Acite and \acite for \Azc and \azc, respectively.

For this language the character ' is made active. Table 22 shows the shortcuts. The main reason for the activation of the ' character is to handle the special hyphenation of the long double consonants.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
47.1 (*code)
47.2 \Ldf Init{magyar}{caption\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, magyar will be an 'unknown' language in which case we have to make it known. So we check for the existence of \l@magyar or \l@hungarian to see whether we have to do something here.

```
47.3 \ifx\l@magyar\@undefined
47.4 \ifx\l@hungarian\@undefined
47.5 \@nopatterns{Magyar}

```

\mathrmale{\textrasmagyar} \textrasmagyar will perform all the extra definitions needed for the \mathrmale{\textrasmagyar} \textrasmagyar is used to cancel the actions of \mathrmale{\textrasmagyar}.

```
 \begin{array}{lll} 47.59 & \colored{0.59} & \colo
```

Now we redefine some commands included into latex.ltx. The original form of a command is always saved with \babel@save and the changes are added to \extrasmagyar. This ensures that the Hungarian version of a macro is alive *only* if the Hungarian language is active.

\fnum@figure In figure and table captions the order of the figure/table number and \figurename /\tablename must be changed. To achieve this \fnum@figure and \fnum@table are redefined and added to \extrasmagyar.

```
47.63 \expandafter\addto\csname extras\CurrentOption\endcsname{% 47.64 \babel@save\fnum@figure 47.65 \def\fnum@figure{\thefigure.\nobreakspace\figurename}} 47.66 \expandafter\addto\csname extras\CurrentOption\endcsname{% 47.67 \babel@save\fnum@table 47.68 \def\fnum@table{\thetable.\nobreakspace\tablename}}
```

\@makecaption The colon in a figure/table caption must be replaced by a dot by redefining \@makecaption.

```
47.69 \expandafter\addto\csname extras\CurrentOption\endcsname{%
47.70 \babel@save\@makecaption
47.71 \def\@makecaption#1#2{%
47.72 \vskip\abovecaptionskip
47.73 \sbox\@tempboxa{#1. #2}%
47.74 \ifdim \wd\@tempboxa >\hsize
47.75 {#1. #2\csname par\endcsname}
```

```
\global \@minipagefalse
               47.77
                          \hb@xt@\hsize{\hfil\box\@tempboxa\hfil}%
               47.78
              47.79
                        \vskip\belowcaptionskip}}
               47.80
     \@caption There should be a dot after the figure/table number in lof/lot, so \@caption is
                 redefined.
               47.81 \expandafter\addto\csname extras\CurrentOption\endcsname{%
                     \babel@save\@caption

         fi}%
```

End of letter class.

47.373 }{}

After making the changes to the L<sup>A</sup>T<sub>E</sub>X macros we define some new ones to handle the problem with definite articles.

\az is a user-level command which decides if the next character is a star. \@az is called for \az\* and \az@ for \az.

```
47.374 \det a\left( \frac{a}{0} \right) {\ az0}
```

 $\Delta z$  \Az is used at the beginning of a sentence. Otherwise it behaves the same as  $\Delta z$ .

47.375 \def\Az{A\Qifstar{\Qaz}{\azQ}}

\az@ \az@ is called if there is no star after \az or \Az. It calls \@az and writes #1 separating with a non-breakable space.

```
47.376 \det az@#1{\langle az\{#1\}\rangle nobreakspace#1}
```

\@az This macro calls \hun@tempadef to remove the accents from the argument then calls \@@az that determines if a 'z' should be written after a/A (written by \az/\Az).

\hun@tempadef The macro \hun@tempadef has three tasks:

• Accent removal. Accented letters confuse  $\$ 00az, the main definite article determinator macro, so they must be changed to their non-accented counterparts. Special letters must also be changed, eg.  $\alpha \rightarrow 0$ .

- Labels must be expanded.
- To handle Roman numerals correctly, commands starting with \hun@ are defined for labels containing Roman numbers with the Roman numerals replaced by their Arabic representation. This macro can check if there is a \hun@ command.

#### There are three arguments:

- The primary command that should be expanded if it exists. This is usually the \hun@ command for a label.
- 2. The secondary command which is used if the first one is \relax. This is usually the original LATEX command for a label.
- 3. This is used if the first two is \relax. For this one no expansion is carried out but the accents are still removed and special letters are changed.

```

```

The following macros are used to determine the definite article for a label's expansion.

```
\aref \aref is an alias for \azr.

47.403 \def\aref{\azr}

\Aref \Aref is an alias for \Azr.

47.404 \def\Aref{\Azr}

\azr \azr calls \@azr if the next character is a star, otherwise it calls \azr@.

47.405 \def\azr{a\@ifstar{\@azr}{\azr@}}

\Azr \Azr is the same as \azr except that it writes 'A' instead of 'a'.

47.406 \def\Azr{A\@ifstar{\@azr}{\azr@}}
```

```
\azr@ \azr@ decides if the next character is ( and in that case it calls \azr@@@ which writes an extra ( for equation referencing. Otherwise \azr@@ is called.

47.407 \def\azr@{\@ifnextchar ({\azr@@@}{\azr@@}}
```

\azr@@ Calls \@azr then writes the label's expansion preceded by a non-breakable space.

47.408 \def\azr@@#1{\@azr{#1}\nobreakspace\ref{#1}}

\azr@@ Same as \azr@@ but inserts a ( between the non-breakable space and the label expansion.

```
47.409 \ensuremath{\mbox{def}\mbox{azr@@@(#1{\mbox{#1}}\nobreakspace(\ref{#1})}}
```

\@azr Calls \hun@tempadef to choose between the label's \hun@ or original LATEX command and to expand it with accent removal and special letter substitution. Then calls \@@az, the core macro of definite article handling.

The following commands are used to generate the definite article for the page number of a label.

```
number of a label.

\apageref \apageref is an alias for \azp.

47.418 \def\apageref {\azp}

\Apageref \Apageref is an alias for \Azp.

47.419 \def\Apageref {\Azp}

\azp Checks if the next character is * and calls \@azp or \azp@.

47.420 \def\azp{a\@ifstar{\@azp}{\azp@}}

\Azp Same as \azp except that it writes 'A' instead of 'a'.

47.421 \def\Azp{A\@ifstar{\@azp}{\azp@}}

\azp@ Calls \@azp then writes the label's page preceded by a non-breakable space.

47.422 \def\azp@#1{\@azp{#1}\nobreakspace\pageref{#1}}
```

\@azp Calls \hun@tempadef then takes the label's page and passes it to \@@az.

```
 47.423 \left( \frac{2\pi 1{\%} }{47.424} \right) \\ 47.425 \left( \frac{\pi 1}{r@#1}{\%} \right) \\ 47.425 \left( \frac{\pi 2}{r@#1} \right) \\ 47.426 \left( \frac{\pi 2}{r@#1} \right) \\ 47.427 \left( \frac{\pi 2}{r@#1} \right) \\ 47.428 \left( \frac{\pi 2}{r@#1} \right) \\ 47.428 \left( \frac{\pi 2}{r@#1} \right) \\ 47.429 \left( \frac{\pi 2}{r@#1} \right) \\ 47.430 \left( \frac{\pi 2}{
```

The following macros are used to give the definite article to citations.

```

\hun@alph@lehgth#2\hbox\hbox!\fi}

This macro is called by \@@az if the argument begins with a letter. The task of \@@az@string is to determine if the argument starts with a vowel and in that case \let\@tempa\@tempb. After checking if the first letter is A, E, I, O, or U, \hun@alph@lehgth is called to determine the length of the argument. If it gives 1 (that is the argument is a single-letter one or the second character is not letter) then the letters L, M, N, R, S, X, and Y are also considered as a vowel since their Hungarian pronounced name starts with a vowel.

\@@az This macro is the core of definite article handling. It determines if the argument needs 'az' or 'a' definite article by setting \@tempa to 'z' or \@empty. It sets \@tempa to 'z' if

- the first character of the argument is 5; or
- the first character of the argument is 1 and the *length of the number* (mod 3) = 1 (one-egy, thousand-ezer, million-egymillió,...); or
- the first character of the argument is a, A, e, E, i, I, o, O, u, or U; or

• the first character of the argument is l, L, m, M, n, N, r, R, s, S, x, X, y, or Y and the length of the argument is 1 or the second character is a non-letter.

At the end it calls \@tempa, that is, it either typesets a 'z' or nothing.

```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

# 48 The Estonian language

The file  ${\tt estonian.dtx}^{57}$  defines the language definition macro's for the Estonian language.

This file was written as part of the TWGML project, and borrows heavily from the babel German and Spanish language files germanb.ldf and spanish.ldf.

Estonian has the same umlauts as German ( $\ddot{a}$ ,  $\ddot{o}$ ,  $\ddot{u}$ ), but in addition to this, we have also  $\tilde{o}$ , and two recent characters  $\check{s}$  and  $\check{z}$ , so we need at least two active characters. We shall use " and  $\tilde{a}$  to type Estonian accents on ASCII keyboards (in the 7-bit character world). Their use is given in table 23. These active accent

     \v z, (and uppercase);
н
     disable ligature at this position;
     an explicit hyphen sign, allowing hyphenation in the
     rest of the word;
     like the old \-, but allowing hyphenation in the rest
     of the word;
     for Estonian low left double quotes (same as Ger-
     man);
11 )
     for Estonian right double quotes;
"<
     for French left double quotes (also rather popular)
     for French right double quotes.
```

Table 23: The extra definitions made by estonian.ldf

characters behave according to their original definitions if not followed by one of the characters indicated in that table; the original quote character can be typed using the macro \dq.

We support also the T1 output encoding (and Cork-encoded text input). You can choose the T1 encoding by the command \usepackage[T1]{fontenc}. This package must be loaded before babel. As the standard Estonian hyphenation file eehyph.tex is in the Cork encoding, choosing this encoding will give you better hyphenation.

As mentioned in the Spanish style file, it may happen that some packages fail (usually in a \message). In this case you should change the order of the \usepackage declarations or the order of the style options in \documentclass.

#### 48.1 Implementation

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
48.1 (*code)
```

 $<sup>\</sup>overline{\phantom{a}^{57}}$  The file described in this section has version number v1.0h and was last revised on 2005/03/30. The original author is Enn Saar, (saar@aai.ee).

```
48.2 \LdfInit{estonian}\captionsestonian
```

If Estonian is not included in the format file (does not have hyphenation patterns), we shall use English hyphenation.

```
48.3 \ifx\l@estonian\@undefined
48.4 \@nopatterns{Estonian}
48.5 \adddialect\l@estonian0
48.6 \fi
```

Now come the commands to switch to (and from) Estonian.

\captionsestonian The macro \captionsestonian defines all strings used in the four standard document classes provided with LATEX.

48.107 \label{eq:continuity} $$48.107 \declare@shorthand{estonian}{^z}{\text{textormath}(\dellare.z)}{\text{check z}}$$
48.108 \end{estonian} {\cite{Continuous} {\cite{C
           and some additional commands:
48.109 \declare@shorthand{estonian}{"-}{\nobreak}-\bl@allowhyphens}
48.110 \declare@shorthand{estonian}{"|}{%
                       \textormath{\nobreak\discretionary{-}{}{\kern.03em}%
48.111
48 112
                                                                   \allowhyphens}{}}
48.113 \declare@shorthand{estonian}{""}{\dq}
48.114 \declare@shorthand{estonian}{^{\sim}}{\langle til}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
48.115 \ldf@finish{estonian}
48.116 \label{code}
```

### 49 The Albanian language

The file  $\mathtt{albanian.dtx}^{58}$  defines all the language definition macros for the Albanian language.

Albanian is written in a latin script, but it has 36 letters, 9 which are diletters (dh, gj, ll, nj, rr, sh, th, xh, zh), and two extra special characters.

For this language the character " is made active. In table 24 an overview is given of its purpose.

- "c \"c, also implemented for the uppercase
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- " disable ligature at this position
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y).
- "' for Albanian left double quotes (looks like ").
- "' for Albanian right double quotes.
- "< for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).

Table 24: The extra definitions made by albanian.ldf

Apart from defining shorthands we need to make sure that the first paragraph of each section is intended. Furthermore the following new math operators are defined (\tg, \ctg, \arctg, \arctg, \sh, \ch, \th, \cth, \arch, \arch,

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
49.1 (*code)
```

#### 49.2 \LdfInit{albanian}\captionsalbanian

When this file is read as an option, i.e. by the \usepackage command, albanian will be an 'unknown' language in which case we have to make it known. So we check for the existence of \l@albanian to see whether we have to do something here.

```
49.3 \ifx\l@albanian\@undefined
49.4 \@nopatterns{Albanian}
49.5 \adddialect\l@albanianO\fi
```

The next step consists of defining commands to switch to (and from) the Albanian language.

\captionsalbanian

The macro  $\c$  albanian defines all strings used in the four standard document classes provided with LaTeX.

```

        Qershor\or Korrik\or Gusht\or Shtator\or Tetor\or N\"entor\or
        Dhjetor\fi \space \number\year}}
```

\noextrasalbanian

\extrasalbanian The macro \extrasalbanian will perform all the extra definitions needed for the Albanian language. The macro \noextrasalbanian is used to cancel the actions of \extrasalbanian.

> For Albanian the "character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the albanian group of shorthands should be used.

```
49.34 \initiate@active@char{"}
49.35 \addto\extrasalbanian{\languageshorthands{albanian}}
49.36 \addto\extrasalbanian{\bbl@activate{"}}
  Don't forget to turn the shorthands off again.
49.37 \addto\noextrasalbanian{\bbl@deactivate{"}}
  First we define shorthands to facilitate the occurrence of letters such as č.
49.38 \declare@shorthand{albanian}{"c}{\textormath{\v c}{\check c}}
49.39 \declare@shorthand{albanian}{"e}{\textormath{\v e}{\check e}}
49.40 \ \c){\c} \ \c)
49.41 \ \c) \ E}{\c) E}{\c) E}
```

Then we define access to two forms of quotation marks, similar to the german and french quotation marks.

```
49.42 \declare@shorthand{albanian}{"'}{%
49.43 \quad \text{\textormath}(\text{\quotedblbase}) \} 
49.44 \declare@shorthand{albanian}{"'}{%
     \textormath{\textquotedblleft{}}{\mbox{\textquotedblleft}}}
49.46 \declare@shorthand{albanian}{"<}{%
     \textormath{\guillemotleft{}}{\mbox{\guillemotleft}}}
```

```
49.48 \declare@shorthand{albanian}{""}{%
49.49 \textormath{\guillemotright{}}{\mbox{\guillemotright}}}
  then we define two shorthands to be able to specify hyphenation breakpoints that behave a little different from \-.
49.50 \declare@shorthand{albanian}{""}{\nobreak-\bbl@allowhyphens}
49.51 \declare@shorthand{albanian}{""}{\hskip\z@skip}
  And we want to have a shorthand for disabling a ligature.
49.52 \declare@shorthand{albanian}{""}{%
49.53 \textormath{\discretionary{-}{}}\kern.03em}}{}}
```

\bbl@frenchindent In albanian the first paragraph of each section should be indented. Add this code \bbl@nonfrenchindent only in LATEX.

```
49.54 \ifx\fmtname plain \else

49.77 \def\Variance{\mathop{\mathop}\mathop{\mathop}\nolimits} D\hskipOpt}\nolimits}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
49.78 \setminus 1df@finish{albanian}
49.79 \langle /code \rangle
```

#### 50 The Croatian language

The file croatian.dtx<sup>59</sup> defines all the language definition macros for the Croatian language.

For this language currently no special definitions are needed or available.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
50.1 (*code)
50.2 \LdfInit{croatian}\captionscroatian
```

When this file is read as an option, i.e. by the \usepackage command, croatian will be an 'unknown' language in which case we have to make it known. So we check for the existence of \lambda@croatian to see whether we have to do something here.

```
50.3 \ifx\l@croatian\@undefined
        \Onopatterns{Croatian}
50.4
        \adddialect\l@croatian0\fi
50.5
```

The next step consists of defining commands to switch to (and from) the Croatian language.

\captionscroatian The macro \captionscroatian defines all strings used in the four standard documentclasses provided with LATEX.

```
50.6 \addto\captionscroatian{%

```
50.36 \setminus 1df@finish\{croatian\}
50.37 (/code)
```

# 51 The Czech Language

The file  $czech.dtx^{60}$  defines all the language definition macros for the Czech language. It is meant as a replacement of  $\mathcal{C}_{\mathcal{S}}$  IATEX, the most-widely used standard for typesetting Czech documents in IATEX.

## 51.1 Usage

For this language \frenchspacing is set.

Additionally, two macros are defined  $\q$  and  $\w$  for easy access to two accents are defined.

The command  $\q$  is used with the letters (t,d,1,andL) and adds a 'to them to simulate a 'hook' that should be there. The result looks like t'. The command  $\w$  is used to put the ring-accent which appears in ångstrøm over the letters u and u.

## 51.2 Compatibility

Great care has been taken to ensure backward compatibility with  $\mathcal{C}_S$ IATEX. In particular, documents which load this file with \usepackage{czech} should produce identical output with no modifications to the source. Additionally, all the  $\mathcal{C}_S$ IATEX options are recognized:

### IL2, T1, OT1

These options set the default font encoding. Please note that their use is deprecated. You should use the fontenc package to select font encoding.

## split, nosplit

These options control whether hyphenated words are automatically split according to Czech typesetting rules. With the split option "je-li" is hyphenated as "je-/-li". The nosplit option disables this behavior.

The use of this option is strongly discouraged, as it breaks too many common things—hyphens cannot be used in labels, negative arguments to TEX primitives will not work in horizontal mode (use \minus as a workaround), and there are a few other peculiarities with using this mode.

### nocaptions

This option was used in  $\mathcal{CSIAT}_{EX}$  to set up Czech/Slovak typesetting rules, but leave the original captions and dates. The recommended way to achieve this is to use English as the main language of the document and use the environment otherlanguage\* for Czech text.

olduv There are two version of \uv. The older one allows the use of \uverb inside the quotes but breaks any respective kerning with the quotes (like that in \$\mathcal{CS}\$ fonts). The newer one honors the kerning in the font but does not allow \uverb inside the quotes.

 $<sup>^{60}</sup>$ The file described in this section has version number v3.1a and was last revised on 2008/07/06. It was rewritten by Petr Tesařík (babel@tesarici.cz).

The new version is used by default in  $\LaTeX 2_{\varepsilon}$  and the old version is used with plain  $\TeX X$ . You may use olduv to override the default in  $\LaTeX 2_{\varepsilon}$ .

cstex This option was used to include the commands \csprimeson and \csprimesoff. Since these commands are always included now, it has been removed and the empty definition lasts for compatibility.

### 51.3 Implementation

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
51.1 (*code)
51.2 \Ldf Init\CurrentOption{date\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, czech might be an 'unknown' language in which case we have to make it known. So we check for the existence of \loczech to see whether we have to do something here.

```
51.3 \ifx\l@czech\@undefined

51.4 \@nopatterns{Czech}

51.5 \adddialect\l@czech0\fi
```

We need to define these macros early in the process.

```
51.6 \def\cs@iltw@{IL2}
51.7 \newif\ifcs@splithyphens
51.8 \cs@splithyphensfalse
```

If Babel is not loaded, we provide compatibility with CSLATEX. However, if macro \@ifpackageloaded is not defined, we assume to be loaded from plain and provide compatibility with csplain. Of course, this does not work well with LATEX 2.09, but I doubt anyone will ever want to use this file with LATEX 2.09.

```
51.9 \ifx\@ifpackageloaded\@undefined
      \let\cs@compat@plain\relax
51.10
       \message{csplain compatibility mode}
51.11
51.12 \ensuremath{\setminus} \texttt{else}
      \@ifpackageloaded{babel}{}{%
51.13
51.14
         \let\cs@compat@latex\relax
51.15
         \message{cslatex compatibility mode}}
51.16 \fi
51.17 \ifx\cs@compat@latex\relax
      \ProvidesPackage{czech}[2008/07/06 v3.1a CSTeX Czech style]
     Declare CSIATEX options (see also the descriptions on page 290).
       \DeclareOption{IL2}{\def\encodingdefault{IL2}}
51.19
       \DeclareOption {T1}{\def\encodingdefault {T1}}}
51.20
51.21
       \DeclareOption{OT1}{\def\encodingdefault{OT1}}
51.22
      \DeclareOption{nosplit}{\cs@splithyphensfalse}
      \DeclareOption{split}{\cs@splithyphenstrue}
51.23
51.24
      \DeclareOption{nocaptions}{\let\cs@nocaptions=\relax}
51.25
      \DeclareOption{olduv}{\let\cs@olduv=\relax}
51.26
      \DeclareOption{cstex}{\relax}
```

Make IL2 encoding the default. This can be overriden with the other font encoding options.

51.27 \ExecuteOptions{\cs@iltw@}

Now, process the user-supplied options.

51.28 \ProcessOptions

Standard IATEX  $2_{\varepsilon}$  does not include the IL2 encoding in the format. The encoding can be loaded later using the fontenc package, but  $\mathcal{C}_{\mathcal{S}}$ IATEX included IL2 by default. This means existing documents for  $\mathcal{C}_{\mathcal{S}}$ IATEX do not load that package, so load the encoding ourselves in compatibility mode.

```
51.29 \ifx\encodingdefault\cs@iltw@
51.30 \input il2enc.def
51.31 \fi
```

Restore the definition of \CurrentOption, clobbered by processing the options.

 $51.32 \ \def\CurrentOption\{czech\}$   $51.33 \fi$ 

The next step consists of defining commands to switch to (and from) the Czech language.

\captionsczech The macro \captionsczech defines all strings used in the four standard documentclasses provided with LATEX.

```
51.34 \verb|\CurrentOption|{%} \\
51.35
       \def\prefacename{P\v{r}edmluva}%

51.55
       \def\glossaryname{Slovn\',\i}k}%
51.56
```

\dateczech The macro \dateczech redefines the command \today to produce Czech dates.

\$\mathcal{CSIATEX}\$ allows line break between the day and the month. However, this behavior has been agreed upon to be a bad thing by the csTeX mailing list in December 2005 and has not been adopted.

```
51.57 \end{cmaller} $1.57 \end{cmaller} $1.58 \end{cmaller} $1.58 \end{cmaller} $$ \end{cmaller} $$ 1.58 \end{cmaller} $$ \end{cmaller} $$ 1.58 \end{cma
```

```
\begin{array}{lll} 51.59 & b \ v\{r\} ezna \ or \ dubna \ or \ kv \ v\{e\} tna \ or \ v\{c\} ervna \
```

\extrasczech The macro \extrasczech will perform all the extra definitions needed for the \noextrasczech Ianguage. The macro \noextrasczech is used to cancel the actions of \extrasczech. This means saving the meaning of two one-letter control sequences before defining them.

For Czech texts \frenchspacing should be in effect. Language group for shorthands is also set here.

```
51.62 \expandafter\addto\csname extras\CurrentOption\endcsname{% 51.63 \bbl@frenchspacing 51.64 \languageshorthands{czech}} 51.65 \expandafter\addto\csname noextras\CurrentOption\endcsname{% 51.66 \bbl@nonfrenchspacing} 51.67 \expandafter\addto\csname extras\CurrentOption\endcsname{% 51.68 \babel@save\q\let\q\v 51.69 \babel@save\w\let\w\r}
```

\sq We save the original single and double quote characters in \sq and \dq to make \dq them available later.

```
51.70 \begingroup\catcode'\"=12\catcode'\'=12
51.71 \def\x{\endgroup}
51.72 \def\sq{'}
51.73 \def\dq{"}}
51.74 \x
```

This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin.

```
51.75 \providehyphenmins{\CurrentOption}{\tw0\thr00}
```

\v LATEX's normal \v accent places a caron over the letter that follows it (ŏ). This is not what we want for the letters d, t, l and L; for those the accent should change shape. This is acheived by the following.

```
51.76 \AtBeginDocument{%
51.77 \DeclareTextCompositeCommand{\v}{0T1}{t}{%
51.78 t\kern-.23em\raise.24ex\hbox{'}}
51.79 \DeclareTextCompositeCommand{\v}{0T1}{d}{%
51.80 d\kern-.13em\raise.24ex\hbox{'}}
51.81 \DeclareTextCompositeCommand{\v}{0T1}{1}{\laranon{}}
51.82 \DeclareTextCompositeCommand{\v}{0T1}{L}{\Lcaron{}}}
```

\lambda For the letters 1 and L we want to disinguish between normal fonts and monospaced \Lambda fonts.

```
51.83 \def\lcaron{%
51.84 \setbox0\hbox{M}\setbox\tw@\hbox{i}%
51.85 \ifdim\wd0>\wd\tw@\relax
51.86     l\kern-.13em\raise.24ex\hbox{'}\kern-.11em%
51.87    \else

51.89    \fi}
51.90 \def\Lcaron{%
```

```
51.91 \setbox0\hbox{M}\setbox\tw@\hbox{i}%
51.92 \ifdim\wd0>\wd\tw@\relax
51.93 L\raise.24ex\hbox to\z@{\kern-.28em'\hss}%
51.94 \else
51.95 L\raise.45ex\hbox to\z@{\kern-.40em '\hss}%
51.96 \fi}
```

Initialize active quotes.  $\mathcal{C}_{\mathcal{S}}$  Part Part Provides a way of converting English-style quotes into Czech-style ones. Both single and double quotes are affected, i.e. ''text'' is converted to something like ',,text'' and 'text' is converted to ,text'. This conversion can be switched on and off with \csprimeson and \csprimesoff.

These quotes present various troubles, e.g. the kerning is broken, apostrophes are converted to closing single quote, some primitives are broken (most notably the  $\colon colon co$

```

 $<sup>^{61}\</sup>mathrm{By}$  the way, the names of these macros are misleading, because the handling of primes in math mode is rather marginal, the most important thing being the handling of quotes...

```
51.128 \declare@shorthand{czech}{"'}{\clqq}
51.129 \declare@shorthand{czech}{"'}{\crqq}
51.130 \declare@shorthand{czech}{"<}{\flqq}
51.131 \declare@shorthand{czech}{">}{\frqq}
51.132 \declare@shorthand{czech}{"=}{\cs@splithyphen}
51.133 \fi
```

\clqq This is the CS opening quote, which is similar to the German quote (\glqq) but the kerning is different.

For the OT1 encoding, the quote is constructed from the right double quote (i.e. the "Opening quotes" character) by moving it down to the baseline and shifting it to the right, or to the left if italic correction is positive.

For T1, the "German Opening quotes" is used. It is moved to the right and the total width is enlarged. This is done in an attempt to minimize the difference between the OT1 and T1 versions.

```
51.134 \ProvideTextCommand{\clqq}{OT1}{%
51.135 \set@low@box{\textquotedblright}%
51.136 \setbox\@ne=\hbox{1\/}\dimen\@ne=\wd\@ne
51.137 \setbox\@ne=\hbox{1}\advance\dimen\@ne-\wd\@ne
51.138 \leavevmode
51.139 \ifdim\dimen\@ne>\z@\kern-.1em\box\z@\kern.1em
51.140 \else\kern.1em\box\z@\kern-.1em\fi\allowhyphens}
51.141 \ProvideTextCommand{\clqq}{T1}
51.142 {\kern.1em\quotedblbase\kern-.0158em\relax}
51.143 \ProvideTextCommandDefault{\clqq}{\UseTextSymbol{OT1}\clqq}
```

\crqq For OT1, the CS closing quote is basically the same as \grqq, only the \textormath macro is not used, because as far as I know, \grqq does not work in math mode anyway.

For T1, the character is slightly wider and shifted to the right to match its OT1 counterpart.

```
51.144 \ProvideTextCommand{\crqq}{OT1}

```

\uv There are two versions of \uv. The older one opens a group and uses \aftergroup to typeset the closing quotes. This version allows using \verb inside the quotes, because the enclosed text is not passed as an argument, but unfortunately it breaks

any kerning with the quotes. Although the kerning with the opening quote could be fixed, the kerning with the closing quote cannot.

The newer version is defined as a command with one parameter. It preserves kerning but since the quoted text is passed as an argument, it cannot contain \verb.

Decide which version of \uv should be used. For sake of compatibility, we use the older version with plain T<sub>F</sub>X and the newer version with L<sup>A</sup>T<sub>F</sub>X  $2_{\varepsilon}$ .

\cs@wordlen Declare a counter to hold the length of the word after the hyphen.

```
51.167 \newcount\cs@wordlen
```

```
\cs@hyphen Store the original hyphen in a macro. Ditto for the ligatures. \cs@endash_51.168 \begingroup\catcode'\-12
```

```
\cs@emdash_1.169 \def\x{\endgroup}
51.170 \def\cs@hyphen{-}

          \fi
51.271
       \fi \cs@next}
51.272
```

\cs@nosplit Insert a non-breakable hyphen followed by the saved word.

```
51.273 \def\cs@nosplit{\cs@boxhyphen\cs@word}
```

\cs@hyphen The \minus sequence can be used where the active hyphen does not work, e.g. in arguments to TEX primitives in outer horizontal mode.

```
51.274 \let\minus\cs@hyphen
```

\standardhyphens These macros control whether split hyphens are allowed in Czech and/or Slovak \splithyphens texts. You may use them in any language, but the split hyphen is only activated for Czech and Slovak.

```
51.275 \ \texttt{\def}\ \texttt{\cs@splithyphensfalse}\ \texttt{\cs@deactivatehyphens}\}
51.276 \ \texttt{\def\splithyphens\{\cs@splithyphenstrue\cs@activatehyphens\}}
```

\cs@splitattr Now we declare the split language attribute. This is similar to the split package option of cslatex, but it only affects Czech, not Slovak.

```
51.277 \def\cs@splitattr{\babel@save\ifcs@splithyphens\splithyphens}
51.278 \bbl@declare@ttribute{czech}{split}{%
       \addto\extrasczech{\cs@splitattr}}
```

\cs@activatehyphens \cs@deactivatehyphens These macros are defined as \relax by default to prevent activating/deactivating the hyphen character. They are redefined when the language is switched to Czech/Slovak. At that moment the hyphen is also activated if split hyphens were requested with \splithyphens.

When the language is de-activated, de-activate the hyphen and restore the bogus definitions of these macros.

```
51.280 \let\cs@activatehyphens\relax
51.281 \let\cs@deactivatehyphens\relax
51.282 \expandafter\addto\csname extras\CurrentOption\endcsname{%
51.283 \def\cs@activatehyphens{\bbl@activate{-}}%
51.284 \def\cs@deactivatehyphens{\bbl@deactivate{-}}%
51.285 \ifcs@splithyphens\cs@activatehyphens\fi}
51.286 \expandafter\addto\csname noextras\CurrentOption\endcsname{%
51.287 \cs@deactivatehyphens
51.288 \let\cs@activatehyphens\relax
51.289 \let\cs@deactivatehyphens\relax}
```

\cs@looseness One of the most common situations where an active hyphen will not work properly is the \looseness primitive. Change its definition so that it deactivates the hyphen if needed.

```
51.290 \let\cs@looseness\looseness
51.291 \def\looseness{%
51.292 \ifcs@splithyphens
51.293 \cs@deactivatehyphens\afterassignment\cs@activatehyphens \fi
51.294 \cs@looseness}
```

\cs@selectlanguage \cs@main@language Specifying the nocaptions option means that captions and dates are not redefined by default, but they can be switched on later with \captionsczech and/or \dateczech.

We mimic this behavior by redefining \selectlanguage. This macro is called once at the beginning of the document to set the main language of the document. If this is \cs@main@language, it disables the macros for setting captions and date. In any case, it restores the original definition of \selectlanguage and expands it.

The definition of \selectlanguage can be shared between Czech and Slovak; the actual language is stored in \cs@main@language.

```
51.295 \ \text{ifx} \ \text{cs@nocaptions} \ \text{Qundefined} \ \text{else}
        \edef\cs@main@language{\CurrentOption}
51.296

cs@undoiltw@ The thing is that  $\LaTeX 2_{\varepsilon}$  core only supports the T1 encoding and does not bother changing the uc/lc/sfcodes when encoding is switched. :( However, the IL2

encoding does change these codes, so if encoding is switched back from IL2, we must also undo the effect of this change to be compatible with  $\LaTeX 2_{\mathcal{E}}$ . OK, this is not the right solution but it works. Cheers to Petr Olšák.

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
51.382 \label{ldf@finish} CurrentOption \\ 51.383 \label{ldfQfinish}
```

# 52 The Polish language

The file  $\mathtt{polish.dtx}^{62}$  defines all the language-specific macros for the Polish language.

For this language the character " is made active. In table 25 an overview is given of its purpose.

```
"a
     or \aob, for tailed-a (like a)
     or \Aob, for tailed-A (like A)
     or \eob, for tailed-e (like e)
"E
     or \Eob, for tailed-E (like E)
     or \'c, for accented c (like ć), same with uppercase
     letters and n,o,s
"1
     or \lpb{}, for l with stroke (like l)
"L
     or \Lpb{}, for L with stroke (like Ł)
"r
     or \zkb{}, for pointed z (like \(\bar{z}\)), cf. pronounciation
"R
     or \Zkb{}, for pointed Z (like Ż)
"z
     or \'z, for accented z
"Z
     or \'z, for accented Z
н
     disable ligature at this position.
     an explicit hyphen sign, allowing hyphenation in the
     rest of the word.
     like "-, but producing no hyphen sign (for compund
     words with hyphen, e.g. x-""y).
11 6
     for German left double quotes (looks like ").
     for German right double quotes.
     for French left double quotes (similar to <<).
     for French right double quotes (similar to >>).
```

Table 25: The extra definitions made by polish.sty

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
52.1 \langle *code \rangle

52.2 \backslash LdfInit\{polish\} \backslash captionspolish
```

When this file is read as an option, i.e. by the \usepackage command, polish could be an 'unknown' language in which case we have to make it known. So we check for the existence of \logolish to see whether we have to do something here.

The next step consists of defining commands to switch to (and from) the Polish language.

\captionspolish The macro \captionspolish defines all strings used in the four standard documentclasses provided with LATEX.

```
52.6 \addto\captionspolish{\%}
```

 $<sup>^{62}</sup>$ The file described in this section has version number v1.2l and was last revised on 2005/03/31.

```

52.27
52.28 }
```

\datepolish The macro \datepolish redefines the command \today to produce Polish dates.

```
52.29 \def\datepolish{%
52.30 \def\today{\number\day^\ifcase\month\or
52.31 stycznia\or lutego\or marca\or kwietnia\or maja\or czerwca\or lipca\or
52.32 sierpnia\or wrze\'snia\or pa\'zdziernika\or listopada\or grudnia\fi
52.33 \space\number\year}%
52.34 }
```

\extraspolish The macro \extraspolish will perform all the extra definitions needed for the \noextraspolish language. The macro \noextraspolish is used to cancel the actions of \extraspolish.

For Polish the " character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the polish group of shorthands should be used.

```
52.35 \initiate@active@char{"}
52.36 \addto\extraspolish{\languageshorthands{polish}}
52.37 \addto\extraspolish{\bbl@activate{"}}

Don't forget to turn the shorthands off again.
52.38 \addto\noextraspolish{\bbl@deactivate{"}}
```

The code above is necessary because we need an extra active character. This character is then used as indicated in table 25.

If you have problems at the end of a word with a linebreak, use the other version without hyphenation tricks. Some TeX wizard may produce a better solution with forcasting another token to decide whether the character after the double quote is the last in a word. Do it and let us know.

In Polish texts some letters get special diacritical marks. Leszek Holenderski designed the following code to position the diacritics correctly for every font in every size. These macros need a few extra dimension variables.

```
52.39 \newdimen\pl@left
       52.40 \newdimen\pl@down
       52.41 \newdimen\pl@right
       52.42 \newdimen\pl@temp
\sob The macro \sob is used to put the 'ogonek' in the right place.

Initially we assume that typesetting is done with text fonts.
52.83 \textpl
52.84 \let\lll=\l \let\LLL=\L
52.85 \def\pll1{\ll1}
```

\telepl But for the 'teletype' font in 'OT1' encoding we have to take some special actions, involving the macros defined above.

```
52.87 \def\telep1{%
52.88 \def\lpb{\spb 1{.45}{.5}{.4}{.8}}%
52.89 \def\Lpb{\spb L{.23}{.5}{.4}{.8}}%
52.90 \def\zkb{\skb z{.5}{.5}{1.2}{0}}%
52.91 \def\Zkb{\skb Z{.5}{.5}{1.1}{0}}}
```

 $52.86 \left\{ \frac{\LLL}{\LLL} \right\}$ 

To activate these codes the font changing commands as they are defined in LATEX are modified. The same is done for plain TEX's font changing commands.

When \selectfont is undefined the current format is sphosed to be either plain (based) or LATeX 2.09.

```
 52.92 \left| ifx > 0 \right| \\ 52.93 \left| ifx \right| \end{tined} \\ 52.94 \left| ifx \right| \end{tined} \addto \right| \end{tined} \\ $2.95 \left| ifx \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.96 \left| ifx \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.96 \left| ifx \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.97 \left| ifx \right| \end{tined} \addto \left| \text{else} \addto \right| \\ 52.98 \left| ifx \right| \end{tined} \end{tined} \end{tined} \\ $2.99 \left| \text{ifx} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.99 \left| \text{ifx} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{else} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{textpl} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{textpl} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{textpl} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{textpl} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{textpl} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{textpl} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{textpl} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{textpl} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{textpl} \right| \end{tined} \addto \left| \text{textpl} \right| \\ 52.100 \left| \text{textpl} \right| \end{ti
```

When \selectfont exists we assume  $\LaTeX 2_{\varepsilon}$ .

```
52.101 \expandafter\addto\csname selectfont \endcsname{% 52.102 \csname\f@encoding @pl\endcsname} 52.103 \fi
```

Currently we support the OT1 and T1 encodings. For T1 we don't have to make a difference between typewriter fonts and other fonts, they all have the same glyphs.

```
52.104 \exp \text{andafter}
```

For OT1 we need to check the current font family, stored in \footnote{Ofamily}. Unfortunately we need a hack as \ttdefault is defined as a \long macro, while \footnote{Ofamily} is not.

```
52.105 \expandafter\def\csname OT1@pl\endcsname{%
52.106 \long\edef\curr@family{\f@family}%
52.107 \ifx\curr@family\ttdefault
52.108 \telepl
52.109 \else
52.110 \textpl
52.111 \fi}
```

```
\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as ".
```

```
52.112 \begingroup \catcode '\"12
52.113 \def\x{\endgroup
52.114 \def\dq{"}}
52.115 \x
```

Now we can define the doublequote macros for diacritics,

```
\label{textormath} $$ \frac{dd}{dd} a} $$ 116 \eclare@shorthand{polish}{"a}{\text{Aob}}{\dd} a} $$ 2.117 \eclare@shorthand{polish}{"a}{\text{textormath}}{\dd} a} $$ 2.118 \eclare@shorthand{polish}{"c}{\text{textormath}}{\c}{\acute c} $$ 2.119 \eclare@shorthand{polish}{"c}{\text{textormath}}{\c}{\dd} e} $$ 2.120 \eclare@shorthand{polish}{"E}{\text{textormath}}{\c}{\dd} e} $$ 2.121 \eclare@shorthand{polish}{"E}{\text{textormath}}{\c}{\dd} e} $$ 2.122 \eclare@shorthand{polish}{"1}{\text{textormath}}{\dd} e} $$ 2.123 \eclare@shorthand{polish}{"1}{\text{textormath}}{\dd} e} $$ 2.123 \eclare@shorthand{polish}{"L}{\text{textormath}}{\dd} e $$ 2.124 \eclare@shorthand{polish}{"n}{\text{textormath}}{\dd} e $$ 2.125 \eclare@shorthand{polish}{"n}{\text{textormath}}{\dd} e $$ 3.126 \eclare@shorthand{polish}{"0}{\text{textormath}}{\dd} e $$ 3.127 \eclare@shorthand{polish}{"0}{\text{textormath}}{\dd} e $$ 3.128 \eclare@shorthand{polish}{"s}{\text{textormath}}{\dd} e $$ 3.129 \eclare@shorthand{polish}{\dd} e $
```

\polishrz The command \polishrz defines the shorthands "r, "z and "x to produce pointed z, accented z and "x. This is the default as these shorthands were defined by this language definition file for quite some time.

```
52.130 \newcommand*{\polishrz}{%
52.131 \declare@shorthand{\polish}{\"r}{\textormath\\zkb}{\ddot r}}%
52.132 \declare@shorthand{\polish}{\"R}{\textormath\\zkb}{\ddot R}}%
52.133 \declare@shorthand{\polish}{\"z}{\textormath\\'z}{\acute z}}%
52.134 \declare@shorthand{\polish}{\"Z}{\textormath\\'z}{\acute Z}}%
52.135 \declare@shorthand{\polish}{\"x}{\dq x}%
52.136 \declare@shorthand{\polish}{\"X}{\dq X}%
52.137 }
52.138 \polishrz
```

The command \polishzx switches to a different set of shorthands, "z, "x and "r to produce pointed z, accented z and "r; a different shorthand notation also in use.

```
\label{thm:command*} $$ \sum_{1.139 \neq 0} \left(\frac{x}{x}\right)^{2.140} \left(\frac{polish}{"z}{\text{\commath}{zkb}{\dot } z}\right)^{2.141} \\ \label{thm:commath} $$ \left(\frac{y}{x}\right)^{2.142} \\ \label{thm:commath} $$ \left(\frac{y}{x}\right)^{2.142} \\ \label{thm:commath} $$ \left(\frac{y}{x}\right)^{2.143} \\ \label{thm:commath} $$ \left(\frac{y}{x}\right)^{2.144} \\ \label{thm:commath} $$ \left(\frac{y}{x}\right)^{2.144
```

Then we define access to two forms of quotation marks, similar to the german and french quotation marks.

```
52.150 \textormath{\textquotedblright}{\mbox{\textquotedblright}}}
52.151 \declare@shorthand{polish}{"<}{%
52.152 \textormath{\guillemotleft}{\mbox{\guillemotleft}}}
52.153 \declare@shorthand{polish}{">}{%
52.154 \textormath{\guillemotright}{\mbox{\guillemotright}}}
then we define two shorthands to be able to specify hyphenation breakpoints that behavew a little different from \-.
52.155 \declare@shorthand{polish}{"-}{\nobreak-\bbl@allowhyphens}}
52.156 \declare@shorthand{polish}{""}{\hskip\z@skip}
And we want to have a shorthand for disabling a ligature.
52.157 \declare@shorthand{polish}{"|}{%
52.158 \textormath{\discretionary{-}{}}\kern.03em}}{}}
```

\mdqon All that's left to do now is to define a couple of commands for reasons of compat-\mdqoff ibility with polish.tex.

```
 52.159 \end{on{\shorthandon{"}}}   52.160 \end{onf{\shorthandoff{"}}}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
52.161 \ldf@finish{polish} 52.162 \langle /code \rangle
```

## 53 The Serbocroatian language

The file serbian.dtx<sup>63</sup> defines all the language definition macros for the Serbian language, typeset in a latin script. In a future version support for typesetting in a cyrillic script may be added.

For this language the character " is made active. In table 26 an overview is given of its purpose. One of the reasons for this is that in the Serbian language some special characters are used.

- "c \"c, also implemented for the lowercase and uppercase s and z.
- "d \dj, also implemented for "D
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "| disable ligature at this position
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y).
- "' for Serbian left double quotes (looks like ").
- "' for Serbian right double quotes.
- "< for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).

Table 26: The extra definitions made by serbian.ldf

Apart from defining shorthands we need to make sure taht the first paragraph of each section is intended. Furthermore the following new math operators are defined (\tg, \ctg, \arctg, \arctg, \sh, \ch, \th, \cth, \arch, \arch,

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
53.1 \text{ $<$code$}
53.2 \text{ $LdfInit{serbian}\captionsserbian}
```

When this file is read as an option, i.e. by the \usepackage command, serbian will be an 'unknown' language in which case we have to make it known. So we check for the existence of \loserbian to see whether we have to do something here.

```
53.3 \ifx\l@serbian\@undefined
53.4 \@nopatterns{Serbian}
53.5 \adddialect\l@serbian0\fi
```

The next step consists of defining commands to switch to (and from) the Serbocroatian language.

 $\colonizer$   $\colonizer$ 

The macro \captionsserbian defines all strings used in the four standard document classes provided with LATEX.

```
53.6 \addto\captionsserbian{%
53.7 \def\prefacename{Predgovor}%
53.8 \def\refname{Literatura}%
```

<sup>63</sup> The file described in this section has version number v1.0d and was last revised on 2005/03/31. A contribution was made by Dejan Muhamedagić (dejan@yunix.com).

```
\def \abstractname{Sa\v{z}etak}%
53.9

       \def\glossaryname{Glossary}% <-- Needs translation
53.27
53.28
      }%
```

\dateserbian The macro \dateserbian redefines the command \today to produce Serbocroatian dates.

```
53.29 \def\dateserbian{%
      \def\today{\number\day .~\ifcase\month\or
53.30
        januar\or februar\or mart\or april\or maj\or
53.31
        juni\or juli\or avgust\or septembar\or oktobar\or novembar\or
        decembar\fi \space \number\year}}
```

\noextrasserbian

\extrasserbian The macro \extrasserbian will perform all the extra definitions needed for the Serbocroatian language. The macro \noextrasserbian is used to cancel the actions of \extrasserbian.

> For Serbian the "character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the serbian group of shorthands should be used.

```
53.34 \initiate@active@char{"}
53.35 \add to \extrasserbian {\languageshorthands {serbian}} \\
53.36 \addto\extrasserbian{\bbl@activate{"}}
```

Don't forget to turn the shorthands off again.

```
53.37 \addto\noextrasserbian{\bbl@deactivate{"}}
```

First we define shorthands to facilitate the occurrence of letters such as č.

```
53.38 \declare@shorthand{serbian}{"c}{\text{textormath}}v c}{\check c}
53.40 \end{serbian} {\tt "s}{\tt textormath} {\tt v s}{\tt check s}}
53.41 \end{serbian} {\tt "z} {\tt textormath} {\tt v z} {\tt check z} \}
53.42 \declare@shorthand{serbian}{"C}{\textormath{\v C}{\check C}}
53.43 \declare@shorthand{serbian}{"D}{\text{VDJ}}{\DJ}}%
53.44 \declare@shorthand{serbian}{"S}{\textormath{\v S}{\check S}}
53.45 \declare@shorthand{serbian}{"Z}{\text{v Z}}{\text{check Z}}
```

Then we define access to two forms of quotation marks, similar to the german and french quotation marks.

```
53.46 \declare@shorthand{serbian}{"'}{%
53.47  \textormath{\quotedblbase{}}{\mbox{\quotedblbase}}}
53.48 \declare@shorthand{serbian}{"'}{%
53.49  \textormath{\textquotedblleft{}}{\mbox{\textquotedblleft}}}
53.50 \declare@shorthand{serbian}{"'>{%
53.51  \textormath{\guillemotleft{}}{\mbox{\guillemotleft}}}}
53.52 \declare@shorthand{serbian}{"'>}{%
53.53  \textormath{\guillemotright{}}{\mbox{\guillemotright}}}}

then we define two shorthands to be able to specify hyphenation breakpoints that behave a little different from \-.
53.54 \declare@shorthand{serbian}{"''}{\nobreak-\bbl@allowhyphens}}
53.55 \declare@shorthand{serbian}{""'}{\hskip\z@skip}

And we want to have a shorthand for disabling a ligature.
53.56 \declare@shorthand{serbian}{"''}{\kern.03em}}{}}
```

\bbl@frenchindent In Serbian the first paragraph of each section should be indented. Add this code \bbl@nonfrenchindent only in LATEX.

```
53.58 \ifx\fmtname plain \else
53.59
      \let\@aifORI\@afterindentfalse
       \def\bbl@frenchindent{\let\@afterindentfalse\@afterindenttrue
53.60
53.61
                              \@afterindenttrue}
      \def\bbl@nonfrenchindent{\let\@afterindentfalse\@aifORI
53 62
                                \@afterindentfalse}
53.63
      \addto\extrasserbian{\bbl@frenchindent}
53.64
      \addto\noextrasserbian{\bbl@nonfrenchindent}
53.65
53.66 \fi
```

\mathserbian Some math functions in Serbian math books have other names: e.g. sinh in Serbian is written as sh etc. So we define a number of new math operators.

```
53.67 \def\sh{\mathop{\operator@font sh}\nolimits} % same as \sinh
53.68 \def\ch{\mathop{\operator@font ch}\nolimits} % same as \cosh
53.69 \def\th{\mathop{\operator@font th}\nolimits} % same as \tanh
53.70 \def\cth{\mathop{\operator@font cth}\nolimits} % same as \coth
53.71 \def\arsh{\mathop{\operator@font arsh}\nolimits}
53.72 \def\arch{\mathop{\operator@font arch}\nolimits}
53.73 \def\arch{\mathop{\operator@font arch}\nolimits}
53.74 \def\arch{\mathop{\operator@font arch}\nolimits}
53.75 \def\tg{\mathop{\operator@font tg}\nolimits} % same as \tan
53.76 \def\ctg{\mathop{\operator@font ctg}\nolimits} % same as \cot
53.77 \def\arctg{\mathop{\operator@font arctg}\nolimits} % same as \arctan
53.78 \def\arctg{\mathop{\operator@font arctg}\nolimits}
53.79 \def\Prob{\mathop{\mathop{\mathop}\nolimits} \nolimits}
53.80 \def\Expect{\mathop{\mathop}\mathop{\mathof}\nolimits} \nolimits}
53.81 \def\Variance{\mathop{\mathof}\mathof}\nolimits} D\hskipOpt}\nolimits}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
53.82 \label{finish} serbian} 53.83 \label{finish} $6.83 \cde
```

# 54 The Slovak language

The file  ${\tt slovak.dtx}^{64}$  defines all the language-specific macros for the Slovak language.

For this language the macro  $\q$  is defined. It was used with the letters  $(t,d,1,and\ L)$  and adds a 'to them to simulate a 'hook' that should be there. The result looks like t'. Since the the T1 font encoding has the corresponding characters it is mapped to  $\v$ . Therefore we recommend using T1 font encoding. If you don't want to use this encoding, please, feel free to redefine  $\q$  in your file. I think babel will honour this ;-).

For this language the characters ", ' and ^ are made active. In table 27 an overview is given of its purpose. Also the vertical placement of the umlaut can be controlled this way.

- "a \"a, also implemented for the other lowercase and uppercase vowels.
- ^d \q d, also implemented for l, t and L.
- c v c, also implemented for C, D, N, n, T, Z and z.
- ^o \^o, also implemented for O.
- 'a, also implemented for the other lowercase and uppercase l, r, y and vowels.
- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y).
- " for a compound word mark without a breakpoint.
- "= for a compound word mark with a breakpoint, allowing hyphenation in the composing words.
- "' for German left double quotes (looks like ").
- "' for German right double quotes.
- "
  for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).

Table 27: The extra definitions made by slovak.ldf

The quotes in table 27 can also be typeset by using the commands in table 28.

### 54.1 Compatibility

Great care has been taken to ensure backward compatibility with  $\mathcal{CSIATEX}$ . In particular, documents which load this file with  $\slash$  should produce identical output with no modifications to the source. Additionally, all the  $\slash$  options are recognized:

<sup>64</sup>The file described in this section has version number v3.1a and was last revised on 2008/07/06. It was originally written by Jana Chlebikova (chlebik@euromath.dk) and modified by Tobias Schlemmer (Tobias.Schlemmer@web.de). It was then rewritten by Petr Tesařík (babel@tesarici.cz).

```
for German left double quotes (looks like ").
\glqq
        for German right double quotes (looks like ")
\grqq
\glq
        for German left single quotes (looks like,).
\grq
        for German right single quotes (looks like ').
\flqq
        for French left double quotes (similar to <<).
\frqq
        for French right double quotes (similar to >>).
        for (French) left single quotes (similar to <).
\flq
        for (French) right single quotes (similar to >).
\frq
\dq
        the original quotes character (").
        the original single quote (,).
\sq
```

Table 28: More commands which produce quotes, defined by slovak.ldf

#### IL2, T1, OT1

These options set the default font encoding. Please note that their use is deprecated. You should use the fontenc package to select font encoding.

#### split, nosplit

These options control whether hyphenated words are automatically split according to Slovak typesetting rules. With the split option "je-li" is hyphenated as "je-/-li". The nosplit option disables this behavior.

The use of this option is strongly discouraged, as it breaks too many common things—hyphens cannot be used in labels, negative arguments to TEX primitives will not work in horizontal mode (use \minus as a workaround), and there are a few other peculiarities with using this mode.

#### nocaptions

This option was used in CSIATEX to set up Czech/Slovak typesetting rules, but leave the original captions and dates. The recommended way to achieve this is to use English as the main language of the document and use the environment otherlanguage\* for Czech text.

olduv There are two version of \uv. The older one allows the use of \uverb inside the quotes but breaks any respective kerning with the quotes (like that in  $\mathcal{C}_{\mathcal{S}}$  fonts). The newer one honors the kerning in the font but does not allow \uverb inside the quotes.

The new version is used by default in  $\LaTeX$   $2\varepsilon$  and the old version is used with plain TEX. You may use olduv to override the default in  $\LaTeX$  TEX  $2\varepsilon$ .

cstex This option was used to include the commands \csprimeson and \csprimesoff. Since these commands are always included now, it has been removed and the empty definition lasts for compatibility.

## 54.2 Implementation

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
54.1 (*code)
54.2 \Ldf Init\CurrentOption{date\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, slovak will be an 'unknown' language in which case we have to make it known. So we check for the existence of \loslovak to see whether we have to do something here.

We need to define these macros early in the process.

```
54.6 \def\cs@iltw@{IL2}
54.7 \newif\ifcs@splithyphens
54.8 \cs@splithyphensfalse
```

If Babel is not loaded, we provide compatibility with  $\mathcal{C}_S$ IAT<sub>E</sub>X. However, if macro \@ifpackageloaded is not defined, we assume to be loaded from plain and provide compatibility with csplain. Of course, this does not work well with IAT<sub>E</sub>X 2.09, but I doubt anyone will ever want to use this file with IAT<sub>E</sub>X 2.09.

```
54.9 \verb|\ifx\oldsymbol{0}ifpackageloaded\oldsymbol{0}|
54.10
       \let\cs@compat@plain\relax
54.11
       \message{csplain compatibility mode}
54.12 \, \text{f else}
       \@ifpackageloaded{babel}{}{%
54.13
          \let\cs@compat@latex\relax
54.14
54.15
          \message{cslatex compatibility mode}}
54.16 \fi
54.17 \ifx\cs@compat@latex\relax
       \ProvidesPackage{slovak} [2008/07/06 v3.1a CSTeX Slovak style]
      Declare \mathcal{C}_{\mathcal{S}} \cong T_{\mathcal{F}} X options (see also the descriptions on page 312).
       \DeclareOption{IL2}{\def\encodingdefault{IL2}}
54.19
       \label{lem:condingdefault T1} $$ \DeclareOption $$T1${\def\encodingdefault T1}$$
54.20
       \DeclareOption{OT1}{\def\encodingdefault{OT1}}
54.21
       \DeclareOption{nosplit}{\cs@splithyphensfalse}
54.22
       \DeclareOption{split}{\cs@splithyphenstrue}
54.23
       \DeclareOption{nocaptions}{\let\cs@nocaptions=\relax}
54.24
       \DeclareOption{olduv}{\let\cs@olduv=\relax}
54.25
       \DeclareOption{cstex}{\relax}
```

Make IL2 encoding the default. This can be overriden with the other font encoding options.

```
54.27 \ExecuteOptions{\cs@iltw@}
```

Now, process the user-supplied options.

```
54.28 \ProcessOptions
```

Standard IATEX  $2_{\varepsilon}$  does not include the IL2 encoding in the format. The encoding can be loaded later using the fontenc package, but  $\mathcal{C}_{\mathcal{S}}$ IATEX included IL2 by default. This means existing documents for  $\mathcal{C}_{\mathcal{S}}$ IATEX do not load that package, so load the encoding ourselves in compatibility mode.

```
54.29 \ifx\encodingdefault\cs@iltw@
54.30 \input il2enc.def
54.31 \fi
```

Restore the definition of \CurrentOption, clobbered by processing the options.

```
54.32 \ \def\CurrentOption\{slovak\} 54.33 \fi
```

The next step consists of defining commands to switch to (and from) the Slovak language.

\captionsslovak The macro \captionsslovak defines all strings used in the four standard documentclasses provided with LATEX.

```
54.34 \@namedef{captions\CurrentOption}{%
      \def\prefacename{Predhovor}%
54.36
      \def\refname{Literat\'ura}%
54.37
      \def\abstractname{Abstrakt}%

54.55
54.56
      }%
```

\dateslovak The macro \dateslovak redefines the command \today to produce Slovak dates.

\extrasslovak The macro \extrasslovak will perform all the extra definitions needed for the Slovak language. The macro \noextrasslovak is used to cancel the actions of \extrasslovak.

For Slovak texts \frenchspacing should be in effect. Language group for shorthands is also set here.

```
54.68 \exp \text{andafter} \ \text{csname} \ \text{extras} \ \text{CurrentOption} \ \text{endcsname} \ \{\% \ 54.69 \ \ \text{babel@save} \ \text{cl} \ \text{csname} \ \text{cond} \ \text{csname} \ \text{cond} \ \text{csname} \ \text{cond} \ \text{csname} \
```

For Slovak three characters are used to define shorthands, they need to be made active.

```
54.70 \ifx\cs@compat@latex\relax\else
      \initiate@active@char{^}
54.71
      \addto\extrasslovak{\bbl@activate{^}}}
54 72
       \addto\noextrasslovak{\bbl@deactivate{^}}}
54.73
      \initiate@active@char{"}
54.74
       \addto\extrasslovak{\bbl@activate{"}\umlautlow}
54.75
       \addto\noextrasslovak{\bbl@deactivate{"}\umlauthigh}
54.76
       \initiate@active@char{'}
54.77
       \@ifpackagewith{babel}{activeacute}{%
54.78
         \addto\extrasslovak{\bbl@activate{'}}
54.79
54.80
         \addto\noextrasslovak{\bbl@deactivate{'}}%
         }{}
54.81
54.82 \fi
```

\sq We save the original single and double quote characters in \sq and \dq to make \dq them available later. The math accent \" can now be typed as ".

```
54.83 \begingroup\catcode'\"=12\catcode'\'=12

54.84 \def\x{\endgroup}

54.85 \def\sq{'}

54.86 \def\dq{"}}

54.87 \x
```

The slovak hyphenation patterns should be used with \lefthyphenmin set to 2 and \righthyphenmin set to 3.

```
54.88 \providehyphenmins{\CurrentOption}{\tw@\thr@@}
```

In order to prevent problems with the active ^ we add a shorthand on system level which expands to a 'normal ^.

```
54.89 \ifx\cs@compat@latex\relax\else

Initialize active quotes.  $\mathcal{C}_{\mathcal{S}}$  Provides a way of converting English-style quotes into Slovak-style ones. Both single and double quotes are affected, i.e. ''text'' is converted to something like ',,text'' and 'text' is converted to ,text'. This conversion can be switched on and off with \csprimeson and \csprimesoff.

These quotes present various troubles, e.g. the kerning is broken, apostrophes are converted to closing single quote, some primitives are broken (most notably the  $\colon colon co$

54.190 }\x
54.191 \def\cs@opendq{\clqq\let\cs@next= }
54.192 \def\cs@closedq\\crqq\let\cs@next= }
```

The way I recommend for typesetting quotes in Slovak documents is to use shorthands similar to those used in German.

```
54.193 \else
54.194 \declare@shorthand{slovak}{"'}{\clqq}
54.195 \declare@shorthand{slovak}{"'}{\crqq}
54.196 \declare@shorthand{slovak}{"'>}{\flqq}
54.197 \declare@shorthand{slovak}{">}{\frqq}
54.198 \fi
```

\clqq This is the CS opening quote, which is similar to the German quote (\glqq) but the kerning is different.

For the OT1 encoding, the quote is constructed from the right double quote (i.e. the "Opening quotes" character) by moving it down to the baseline and shifting it to the right, or to the left if italic correction is positive.

For T1, the "German Opening quotes" is used. It is moved to the right and the total width is enlarged. This is done in an attempt to minimize the difference between the OT1 and T1 versions.

```
54.199 \ProvideTextCommand{\clqq}{OT1}{%
54.200 \set@low@box{\textquotedblright}%
54.201 \setbox\@ne=\hbox{1\/}\dimen\@ne=\wd\@ne
54.202 \setbox\@ne=\hbox{1}\advance\dimen\@ne-\wd\@ne
54.203 \leavevmode
54.204 \ifdim\dimen\@ne>\z@\kern-.1em\box\z@\kern.1em
54.205 \else\kern.1em\box\z@\kern-.1em\fi\allowhyphens}
54.206 \ProvideTextCommand{\clqq}{T1}
54.207 {\kern.1em\quotedblbase\kern-.0158em\relax}
54.208 \ProvideTextCommandDefault{\clqq}{\UseTextSymbol{OT1}\clqq}
```

\crqq For OT1, the CS closing quote is basically the same as \grqq, only the \textormath macro is not used, because as far as I know, \grqq does not work in math mode anyway.

For T1, the character is slightly wider and shifted to the right to match its OT1 counterpart.

```
54.209 \ProvideTextCommand{\crqq}{0T1}
54.210 {\save@sf@q{\nobreak\kern-.07em\textquotedblleft\kern.07em}}
54.211 \ProvideTextCommand{\crqq}{T1}

54.218 \ProvideTextCommandDefault{\clq}{\UseTextSymbol{0T1}\clq}}
54.219 \ProvideTextCommand{\crq}{0T1}
```

There are two versions of \uv. The older one opens a group and uses \aftergroup to typeset the closing quotes. This version allows using \verb inside the quotes, because the enclosed text is not passed as an argument, but unfortunately it breaks any kerning with the quotes. Although the kerning with the opening quote could be fixed, the kerning with the closing quote cannot.

The newer version is defined as a command with one parameter. It preserves kerning but since the quoted text is passed as an argument, it cannot contain \verb.

Decide which version of \uv should be used. For sake of compatibility, we use the older version with plain T<sub>F</sub>X and the newer version with  $\text{LAT}_{FX} 2_{\varepsilon}$ .

```
54.224 \ ifx \cs@compat@plain\@undefined\else\let \cs@olduv=\relax\fi\\ 54.225 \ ifx \cs@olduv\@undefined\\ 54.226 \ \DeclareRobustCommand\uv[1]{{\leavevmode\clqq#1\crqq}}\\ 54.227 \else\\ 54.228 \ \DeclareRobustCommand\uv{\bgroup\aftergroup\closequotes}\\ 54.229 \ \leavevmode\clqq\let \cs@next=}\\ 54.230 \ \def\closequotes{\unskip\crqq\relax}}\\ 54.231 \fi
```

\cs@wordlen Declare a counter to hold the length of the word after the hyphen.

```
54.232 \newcount\cs@wordlen
```

\cs@hyphen Store the original hyphen in a macro. Ditto for the ligatures.

```

\cs@continuescan \cs@gettoken \cs@gett@ken

\cs@scanword Each token is first analyzed with \cs@scanword, which expands the token and passes the first token of the result to \cs@gett@ken. If the expanded token is not identical to the unexpanded one, presume that it might be expanded further and pass it back to \cs@scanword until you get an unexpandable token. Then analyze it in \cs@examinetoken.

The \cs@continuescan macro does the same thing as \cs@scanword, but it does not require the first token to be in \cs@token already.

cs@examinetoken Examine the token in \cs@token:

- If it is a letter (catcode 11) or other (catcode 12), add it to \cs@word with \cs@addparam.
- If it is the \char primitive, add it with \cs@expandchar.
- If the token starts or ends a group, ignore it with \cs@ignoretoken.
- Otherwise analyze the meaning of the token with \cs@checkchardef to detect primitives defined with \chardef.

```
54.289 \def\cs@examinetoken{%
     \ifcat A\cs@token

          \expandafter\meaning\expandafter\cs@token\string\char\end}%
      fi\fi\fi\fi\fi\fi\cs@next
54.307
```

\cs@checkchardef Check the meaning of a token and if it is a primitive defined with \chardef, pass it to \\@examinechar as if it were a \char sequence. Otherwise, there are no more word characters, so do the final actions in \cs@nosplit.

\cs@ignoretoken Add a token to \cs@word but do not update the \cs@wordlen counter. This is mainly useful for group starting and ending primitives, which need to be preserved, but do not affect the word boundary.

```
54.316 \enskip \fi to $4.317 \enskip \fi to $4.318 \enskip \fi t
```

cs@addparam Add a token to \cs@word and check its lccode. Note that this macro can only be used for tokens which can be passed as a parameter.

```
54.319 \def\cs@addparam#1{%

54.320 \edef\cs@word{\cs@word#1}%

54.321 \cs@checkcode{\lccode'#1}}
```

\cs@expandchar Add a \char sequence to \cs@word and check its lccode. The charcode is first parsed in \cs@expandchar and then the resulting \chardef-defined sequence is analyzed in \cs@examinechar.

```
54.322 \def\cs@expandchar{\afterassignment\cs@examinechar\cs@token=} \\ 54.323 \def\cs@examinechar{%} \\ 54.324 \edef\cs@word{\cs@word\char\the\cs@token\space}% \\ 54.325 \cs@checkcode{\lccode\cs@token}}
```

\cs@checkcode Check the lccode of a character. If it is zero, it does not count to the current word, so finish it with \cs@nosplit. Otherwise update the \cs@wordlen counter and go on scanning the word with \cs@continuescan. When enough characters are gathered in \cs@word to allow word break, insert the split hyphen and finish.

```

          \fi
54.336
        \fi \cs@next}
54.337
```

\cs@nosplit Insert a non-breakable hyphen followed by the saved word.

```
54.338 \def\cs@nosplit{\cs@boxhyphen\cs@word}
```

\cs@hyphen The \minus sequence can be used where the active hyphen does not work, e.g. in arguments to TeX primitives in outer horizontal mode.

 $\$  \standardhyphens \splithyphens

These macros control whether split hyphens are allowed in Czech and/or Slovak texts. You may use them in any language, but the split hyphen is only activated for Czech and Slovak.

```
54.340 \det \frac{\cs@splithyphensfalse\cs@deactivatehyphens}{54.341 \det \cs@splithyphensfuse\cs@activatehyphens}
```

\cs@splitattr Now we declare the split language attribute. This is similar to the split package option of cslatex, but it only affects Slovak, not Czech.

```
54.342 \def\cs@splitattr{\babel@save\ifcs@splithyphens\splithyphens}
54.343 \bbl@declare@ttribute{slovak}{split}{%
54.344 \addto\extrasslovak{\cs@splitattr}}
```

\cs@activatehyphens \cs@deactivatehyphens These macros are defined as \relax by default to prevent activating/deactivating the hyphen character. They are redefined when the language is switched to Czech/Slovak. At that moment the hyphen is also activated if split hyphens were requested with \splithyphens.

When the language is de-activated, de-activate the hyphen and restore the bogus definitions of these macros.

```
54.345 \ \text{let} \ \text{cs@activatehyphens} \ \text{relax}
54.346 \verb|\let\cs@deactivatehyphens\relax|
54.347 \verb|\expandafter\addto\csname| extras\CurrentOption\endcsname {\%} 
         \def\cs@activatehyphens{\bbl@activate{-}}%
54.348
         \def\cs@deactivatehyphens{\bbl@deactivate{-}}%
54.349
        \ifcs@splithyphens\cs@activatehyphens\fi}
54.350
54.351 \text{ } \text{cyandafter}  add to \csname \no extras \Current \Option \end csname \{\% \no extras \cdot \Current \Option \end \csname \} \}
         \cs@deactivatehyphens
54.352
         \let\cs@activatehyphens\relax
54.353
54.354
        \let\cs@deactivatehyphens\relax}
```

\cs@looseness One of the most common situations where an active hyphen will not work properly \looseness is the \looseness primitive. Change its definition so that it deactivates the hyphen if needed.

```
54.355 \let\cs@looseness\looseness
54.356 \def\looseness{%
       \ifcs@splithyphens
54.357
         \cs@deactivatehyphens\afterassignment\cs@activatehyphens \fi
54 358
```

\cs@selectlanguage \cs@main@language

Specifying the nocaptions option means that captions and dates are not redefined by default, but they can be switched on later with \captionsslovak and/or \dateslovak.

We mimic this behavior by redefining \selectlanguage. This macro is called once at the beginning of the document to set the main language of the document. If this is \cs@main@language, it disables the macros for setting captions and date. In any case, it restores the original definition of \selectlanguage and expands it.

The definition of \selectlanguage can be shared between Czech and Slovak; the actual language is stored in \cs@main@language.

```
54.360 \ ifx \ cs@nocaptions \ @undefined \ else
        \edef\cs@main@language{\CurrentOption}
54.361
        \ifx\cs@origselect\@undefined
54.362
54.363
          \let\cs@origselect=\selectlanguage
          \def\selectlanguage{%
54.364
54.365
            \let\selectlanguage\cs@origselect
54.366
            \ifx\bbl@main@language\cs@main@language
54.367
              \expandafter\cs@selectlanguage
54.368
            \else
```

```
54.369 \expandafter\selectlanguage
54.370 \fi}
54.371 \def\cs@selectlanguage{%}
54.372 \cs@tempdisable{captions}%
54.373 \cs@tempdisable{date}%
54.374 \selectlanguage}
```

\cs@tempdisable \cs@tempdisable disables a language setup macro temporarily, i.e. the macro with the name of  $\langle \#1 \rangle$ \bbl@main@language just restores the original definition and purges the saved macro from memory.

CS@undoiltw@ The thing is that  $\LaTeX 2_{\varepsilon}$  core only supports the T1 encoding and does not bother changing the uc/lc/sfcodes when encoding is switched. :( However, the IL2 encoding does change these codes, so if encoding is switched back from IL2, we must also undo the effect of this change to be compatible with  $\LaTeX 2_{\varepsilon}$ . OK, this is not the right TM solution but it works. Cheers to Petr Olšák.

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

## 55 The Slovenian language

The file  ${\tt slovene.dtx}^{66}$  defines all the language-specific macros for the Slovenian language.

For this language the character " is made active. In table 29 an overview is given of its purpose. One of the reasons for this is that in the Slovene language some special characters are used.

- "c \"c, also implemented for the lowercase and uppercase s and z.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y).
- "' for Slovene left double quotes (looks like ").
- "' for Slovene right double quotes.
- "< for French left double quotes (similar to <<).
- "> for French right double quotes (similar to >>).

Table 29: The extra definitions made by slovene.ldf

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
55.1 \langle *code \rangle
55.2 \LdfInit\{slovene\}\captionsslovene
```

When this file is read as an option, i.e. by the \usepackage command, slovene will be an 'unknown' language in which case we have to make it known. So we check for the existence of \losslovene to see whether we have to do something here.

```
55.3 \ifx\l@slovene\@undefined
55.4 \@nopatterns{Slovene}
55.5 \adddialect\l@slovene0\fi
```

The next step consists of defining commands to switch to the Slovenian language. The reason for this is that a user might want to switch back and forth between languages.

\captionsslovene

The macro \captionsslovene defines all strings used in the four standard document classes provided with LATEX.

```
55.6 \addto\captionsslovene{%
55.7 \def\prefacename{Predgovor}%

       \def\ccname{Kopije}%
55.21
55.22
      \def\headtoname{Prejme}%
       \def\pagename{Stran}%
55.23
       \def\seename{glej}%
55.24
       \def\alsoname{glej tudi}%
55.25
55.26
       \def\proofname{Dokaz}%
       \def\glossaryname{Glossary}% <-- Needs translation
55.27
55.28
```

\dateslovene The macro \dateslovene redefines the command \today to produce Slovenian dates.

```
55.29 \def\dateslovene{%
      \def\today{\number\day.~\ifcase\month\or
55.31
        januar\or februar\or marec\or april\or maj\or junij\or
55 32
         julij\or avgust\or september\or oktober\or november\or december\fi
55.33
        \space \number\year}}
```

\extrasslovene \noextrasslovene The macro \extrasslovene performs all the extra definitions needed for the Slovenian language. The macro \noextrasslovene is used to cancel the actions of \extrasslovene.

For Slovene the " character is made active. This is done once, later on its definition may vary. Other languages in the same document may also use the " character for shorthands; we specify that the slovenian group of shorthands should be used.

```
55.34 \initiate@active@char{"}
55.35 \addto\extrasslovene{\languageshorthands{slovene}}
55.36 \addto\extrasslovene{\bbl@activate{"}}
  Don't forget to turn the shorthands off again.
```

55.37 \addto\noextrasslovene{\bbl@deactivate{"}} First we define shorthands to facilitate the occurrence of letters such as č.

```
55.38 \declare@shorthand{slovene}{"c}{\textormath{\v c}{\check c}}
55.39 \declare@shorthand{slovene}{"s}{\textormath{\v s}{\check s}}
55.40 \declare@shorthand{slovene}{"z}{\textormath{\v z}{\check z}}
55.41 \declare@shorthand{slovene}{"C}{\textormath{\v C}{\check C}}
55.42 \declare@shorthand{slovene}{"S}{\textormath{\v S}{\check S}}
55.43 \declare@shorthand{slovene}{"Z}{\text{xtormath}(v Z}{\text{check Z}}
```

Then we define access to two forms of quotation marks, similar to the german and french quotation marks.

```
55.44 \declare@shorthand{slovene}{"'}{%
55.45 \textormath{\quotedblbase}{\mbox{\quotedblbase}}}
55.46 \declare@shorthand{slovene}{"'}{%
      \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
55.48 \ensuremath{\texttt{declare@shorthand{slovene}}{"<}}{\%}
      \textormath{\guillemotleft}{\mbox{\guillemotleft}}}
```

```
55.50 \declare@shorthand{slovene}{">}{%
55.51 \textormath{\guillemotright}{\mbox{\guillemotright}}}
then we define two shorthands to be able to specify hyphenation breakpoints that behavew a little different from \-.
55.52 \declare@shorthand{slovene}{"-}{\nobreak-\bbl@allowhyphens}
55.53 \declare@shorthand{slovene}{""}{\hskip\z@skip}
And we want to have a shorthand for disabling a ligature.
55.54 \declare@shorthand{slovene}{"|}{%
55.55 \textormath{\discretionary{-}{}{\kern.03em}}{}}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
55.56 \ldf@finish{slovene} 55.57 \langle /code \rangle
```

## 56 The Russian language

The file russianb.dtx<sup>67</sup> defines all the language-specific macros for the Russian language. It needs the file cyrcod for success documentation with Russian encodings (see below).

For this language the character " is made active. In table 30 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "--- Cyrillic emdash in plain text.
- "--~ Cyrillic emdash in compound names (surnames).
- "--\* Cyrillic emdash for denoting direct speech.
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y or some other signs as "disable/enable").
- " for a compound word mark without a breakpoint.
- "= for a compound word mark with a breakpoint, allowing hyphenation in the composing words.
- ", thinspace for initials with a breakpoint in following surname.
- for German left double quotes (looks like ").
- for German right double quotes (looks like ").
- "< for French left double quotes (looks like  $\ll$ ).
- "> for French right double quotes (looks like >>).

Table 30: The extra definitions made by russianb

The quotes in table 30 can also be typeset by using the commands in table 31.

```
\cdash---
             Cyrillic emdash in plain text.
\cdash--~
             Cyrillic emdash in compound names (surnames).
\cdash--*
             Cyrillic emdash for denoting direct speech.
\glqq
             for German left double quotes (looks like ").
             for German right double quotes (looks like ").
\grqq
             for French left double quotes (looks like «).
\flqq
             for French right double quotes (looks like >>).
\frqq
             the original quotes character (").
\dq
```

Table 31: More commands which produce quotes, defined by babel

The French quotes are also available as ligatures '<<' and '>>' in 8-bit Cyrillic font encodings (LCY, X2, T2\*) and as '<' and '>' characters in 7-bit Cyrillic font encodings (OT2 and LWN).

 $<sup>^{67}</sup>$ The file described in this section has version number? and was last revised on?. This file was initially derived from the original version of german.sty, which has some definitions for Russian. Later the definitions from russian.sty version 1.0b (for LATEX 2.09), russian.sty version v2.5c (for LATEX 2 $_{\mathcal{E}}$ ) and francais.sty version 4.5c and germanb.sty version 2.5c were added.

The quotation marks traditionally used in Russian were borrowed from other languages (e.g., French and German) so they keep their original names.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
56.1 \langle *code \rangle

56.2 \backslash LdfInit\{russian\}\{captionsrussian\}
```

When this file is read as an option, i.e., by the \usepackage command, russianb will be an 'unknown' language, in which case we have to make it known. So we check for the existence of \lorussian to see whether we have to do something here.

```
56.3 \ifx\l@russian\@undefined
56.4 \@nopatterns{Russian}
56.5 \adddialect\l@russian0
56.6 \fi
```

 $\verb|\latinencoding|$ 

We need to know the encoding for text that is supposed to be which is active at the end of the babel package. If the fontenc package is loaded later, then...too bad!

```
56.7 \let\latinencoding\cf@encoding
```

The user may choose between different available Cyrillic encodings—e.g., X2, LCY, or LWN. Hopefully, X2 will eventually replace the two latter encodings (LCY and LWN). If the user wants to use another font encoding than the default (T2A), he has to load the corresponding file *before* russianb.sty. This may be done in the following way:

```
% override the default X2 encoding used in Babel
\usepackage[LCY,0T1]{fontenc}
\usepackage[english,russian]{babel}
```

Note: for the Russian language, the T2A encoding is better than X2, because X2 does not contain Latin letters, and users should be very careful to switch the language every time they want to typeset a Latin word inside a Russian phrase or vice versa.

We parse the \cdp@list containing the encodings known to IATEX in the order they were loaded. We set the \cyrillicencoding to the *last* loaded encoding in the list of supported Cyrillic encodings: OT2, LWN, LCY, X2, T2C, T2B, T2A, if any.

```
56.8 \def\reserved@a#1#2{%}
56.9
        \edef\reserved@b{#1}%
        \edef\reserved@c{#2}%
56.10
56.11
        \ifx\reserved@b\reserved@c
56.12
          \let\cyrillicencoding\reserved@c
56.13
56.14 \def\cdp@elt#1#2#3#4{%
        \reserved@a{#1}{0T2}%
56.15
56.16
       \reserved@a{#1}{LWN}%
56.17
       \reserved@a{#1}{LCY}%
       \reserved@a{\#1}{X2}%
56.18
       \rcserved@a{#1}{T2C}%
56.19
       \reserved@a{#1}{T2B}%
56.20
56 21
       \reserved@a{\#1}{T2A}}
56.22 \cdp@list
```

Now, if \cyrillicencoding is undefined, then the user did not load any of supported encodings. So, we have to set \cyrillicencoding to some default value. We test the presence of the encoding definition files in the order from less preferable to more preferable encodings. We use the lowercase names (i.e., lcyenc.def instead of LCYenc.def).

```
56.23 \ifx\cyrillicencoding\undefined
56.24 \IfFileExists{ot2enc.def}{\def\cyrillicencoding{OT2}}\relax
56.25 \IfFileExists{lwnenc.def}{\def\cyrillicencoding{LWN}}\relax
56.26 \IfFileExists{lcyenc.def}{\def\cyrillicencoding{LCY}}\relax
56.27 \IfFileExists{x2enc.def}{\def\cyrillicencoding{X2}}\relax

56.71
```

Unfortunately, the commands AA and a are not encoding dependent in  $AT_EX$  (unlike e.g., o or DH). They are defined as  $r\{A\}$  and  $r\{a\}$ . This leads to unpredictable results when the font encoding does not contain the Latin letters A and A (like A2).

The following block redefines the character class of uppercase Greek letters and some accents, if it is equal to 7 (variable family), to avoid incorrect results if the font encoding in some math family does not contain these characters in places of OT1 encoding. The code was taken from amsmath.dtx. See comments and further explanation there.

```
56.77 % \begingroup\catcode \"=12
56.78 % % uppercase greek letters:
56.79 % \def\@tempa#1{\expandafter\@tempb\meaning#1\relax\relax\relax\relax

```

The user should use the inputenc package when any 8-bit Cyrillic font encoding is used, selecting one of the Cyrillic input encodings. We do not assume any default input encoding, so the user should explicitly call the inputenc package by \usepackage{inputenc}. We also removed \AtBeginDocument, so inputenc should be used before babel.

```
56.103 \@ifpackageloaded{inputenc}{}{%
56.104 \def\reserved@a{LWN}%
56.105 \ifx\reserved@a\cyrillicencoding\else
56.106 \def\reserved@a{OT2}%
56.107 \ifx\reserved@a\cyrillicencoding\else
56.108 \PackageWarning{babel}%
56.109 {No input encoding specified for Russian language}
56.110 \fi\fi
```

Now we define two commands that offer the possibility to switch between Cyrillic and Roman encodings.

\cyrillictext \latintext

The command \cyrillictext will switch from Latin font encoding to the Cyrillic font encoding, the command \latintext switches back. This assumes that the 'normal' font encoding is a Latin one. These commands are declarations, for shorter peaces of text the commands \textlatin and \textcyrillic can be used.

```
56.111 %\DeclareRobustCommand{\latintext}{% 56.112 % \fontencoding{\latinencoding}\selectfont 56.113 % \def\encodingdefault{\latinencoding}} 56.114 \let\lat\latintext
```

\textcyrillic These commands take an argument which is then typeset using the requested font \textlatin encoding.

```
56.115 \DeclareTextFontCommand{\textcyrillic} {\cyrillictext} 56.116 %\DeclareTextFontCommand{\textlatin} {\latintext}
```

We make the TeX

```
56.117 %\ifx\ltxTeX\undefined\let\ltxTeX\fi
56.118 %\ProvideTextCommandDefault{\TeX}{\textlatin{\ltxTeX}}
and LATFX logos encoding independent.
```

The next step consists of defining commands to switch to (and from) the Russian language.

\captionsrussian

The macro \captionsrussian defines all strings used in the four standard document classes provided with LATEX. The two commands \cyr and \lat activate Cyrillic resp. Latin encoding.

```
56.121\addto\captionsrussian\{\% 56.122\% FIXME: Where is the \prefacename used?
```

```

         \ \number\year~\cyrg.}}
```

\extrasrussian The macro \extrasrussian will perform all the extra definitions needed for the Russian language. The macro \noextrasrussian is used to cancel the actions of \extrasrussian.

The first action we define is to switch on the selected Cyrillic encoding whenever we enter 'russian'.

```
56.200 \addto\extrasrussian{\cyrillictext}
```

When the encoding definition file was processed by IATEX the current font encoding is stored in \latinencoding, assuming that IATEX uses T1 or OT1 as default. Therefore we switch back to \latinencoding whenever the Russian language is no longer 'active'.

```
56.201 \addto\noextrasrussian{\latintext}
```

\verbatim@font In order to get both Latin and Cyrillic letters in verbatim text we need to change the definition of an internal LATEX command somewhat:

```
56.202 %\def\verbatim@font{%
56.203 % \let\encodingdefault\latinencoding
56.204 % \normalfont\ttfamily
56.205 % \expandafter\def\csname\cyrillicencoding-cmd\endcsname##1##2{%
56.206 % \ifx\protect\@typeset@protect
56.207 % \begingroup\UseTextSymbol\cyrillicencoding##1\endgroup
56.208 % \else\noexpand##1\fi}
```

The category code of the characters ':', ';', '!', and '?' is made \active to insert a little white space.

For Russian (as well as for German) the "character also is made active.

Note: It is *very* questionable whether the Russian typesetting tradition requires additional spacing before those punctuation signs. Therefore, we make the corresponding code optional. If you need it, then define the frenchpunct docstrip option in babel.ins.

Borrowed from french. Some users dislike automatic insertion of a space before 'double punctuation', and prefer to decide themselves whether a space should be added or not; so a hook \NoAutoSpaceBeforeFDP is provided: if this command is added (in file russianb.cfg, or anywhere in a document) russianb will respect your typing, and introduce a suitable space before 'double punctuation' if and only if a space is typed in the source file before those signs.

The command  $\AutoSpaceBeforeFDP$  switches back to the default behavior of russianb.

```
 56.209 \ \langle *frenchpunct \rangle \\ 56.210 \ \langle initiate@active@char\{:\} \\ 56.211 \ \langle initiate@active@char\{:\} \\ 56.212 \ \langle /frenchpunct \rangle \\ 56.213 \ \langle *frenchpunct | spanishligs \rangle \\ 56.214 \ \langle initiate@active@char\{!\} \\ 56.215 \ \langle initiate@active@char\{?\} \\ 56.216 \ \langle /frenchpunct | spanishligs \rangle \\ 56.217 \ \langle initiate@active@char\{"\}
```

The code above is necessary because we need extra active characters. The character " is used as indicated in table 30.

We specify that the Russian group of shorthands should be used.

```
56.218 \addto\extrasrussian{\languageshorthands{russian}}
```

These characters are 'turned on' once, later their definition may vary.

The X2 and T2\* encodings do not contain spanish\_shriek and spanish\_query symbols; as a consequence, the ligatures '?' and '!' do not work with them (these characters are useless for Cyrillic texts anyway). But we define the shorthands to emulate these ligatures (optionally).

We do not use  $\label{latinencoding}$  here (but instead explicitly use OT1) because the user may choose T2A to be the primary encoding, but it does not contain these characters.

```
\russian@sh@;@ We have to reduce the amount of white space before;,: and !. This should only \russian@sh@:@ happen in horizontal mode, hence the test with \ifhmode.
```

```
\label{eq:continuous} $$ \russian@sh@!@_{56.231} \end{punct} $$ \russian@sh@?@_{6.232} \end{punct} $$ $_{6.233} \ \ $$ ifhmode
```

In horizontal mode we check for the presence of a 'space', 'unskip' if it exists and place a 0.1em kerning.

```
56.234 \ifdim\lastskip>\z@

56.235 \unskip\nobreak\kern.1em

56.236 \else
```

If no space has been typed, we add \FDP@thinspace which will be defined, up to the user's wishes, as an automatic added thinspace, or as \@empty.

```
56.237 \FDP@thinspace
56.238 \fi
56.239 \fi
```

Now we can insert a ';' character.

```
56.240 \string;}
```

The other definitions are very similar.

```
56.241 \declare@shorthand{russian}{:}{%
56.242
         \ifhmode
56.243
            \left\langle ifdim \right\rangle z = 0
56.244
               \unskip\nobreak\kern.1em
56.245
            \else
56.246
                  \FDP@thinspace
            \fi
56.247
          \backslash fi
56.248
          \string:}
56.249
56.250 \declare@shorthand\{russian\}\{!\}\{\%\}
          \ifhmode
56.251
56.252
            \left\langle ifdim\right\rangle = \left\langle z\right\rangle 
56.253
               \unskip\nobreak\kern.1em
56.254
                  \FDP@thinspace
56.255
            \fi
56.256
          \fi
56.257
          \string!}
56.258
56.259 \declare@shorthand{russian}{?}{%
          \ifhmode
56.260
56.261
            \left\langle ifdim \right\rangle z = 1
56.262
               \unskip\nobreak\kern.1em
            \else
56.263
                  \FDP@thinspace
56.264
56.265
            \fi
          \fi
56 266
56.267
          \string?}
```

\AutoSpaceBeforeFDP \FDP@thinspace is defined as unbreakable spaces if \AutoSpaceBeforeFDP is \NoAutoSpaceBeforeFDP activated or as \@empty if \NoAutoSpaceBeforeFDP is in use. The default is \FDP@thinspace \AutoSpaceBeforeFDP.

```
56.268 \def\AutoSpaceBeforeFDP{%
56.269 \def\FDP@thinspace{\nobreak\kern.1em}}
56.270 \def\NoAutoSpaceBeforeFDP{\let\FDP@thinspace\@empty}
56.271 \AutoSpaceBeforeFDP
```

\fdotFDPon The next macros allow to switch on/off activeness of double punctuation signs.

\system@sh@:@ When the active characters appear in an environment where their Russian be-\system@sh@!@ haviour is not wanted they should give an 'expected' result. Therefore we define \system@sh@?@ shorthands at system level as well.

```
\label{eq:system:system:system:system:system:system:system:} $$ 6.281 \declare@shorthand{system}{;}{\string:} $$ 6.282 \declare@shorthand{system}{;}{\string:} $$ 6.283 \end{system:shligs} $$ 6.284 \declare@shorthand{system}{!}{\string!} $$ 6.285 \declare@shorthand{system}{?}{\string:} $$ 6.286 \declare@shorthand{system}{?}{\string:} $$ 6.286 \declare@shorthand{system}{?}{\string:} $$ 6.286 \declare@shorthand{system}{\string:} $$ 6.286 \declare@shorthand{system}{\string:} $$ 6.286 \declare@shorthand{system}$$$ $$ 6.286 \declare@shorthand{system}$$ $$ 6.286 \declare@shorthand{system}$$ $$ $$ 6.286 \declare@shorthand{system}$$ $$ $$ 6.286 \declare@shorthand{system}$$ $$ 6.286 \declare@shorthand{system}
```

To be able to define the function of '"', we first define a couple of 'support' macros.

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as '".

```
56.287 \begingroup \catcode '\"12
56.288 \def\reserved@a{\endgroup
56.289 \def\@SS{\mathchar"7019 }
56.290 \def\dq{"}}
56.291 \reserved@a
```

Now we can define the doublequote macros: german and french quotes. We use definitions of these quotes made in babel.sty. The french quotes are contained in the T2\* encodings.

```
56.292 \declare@shorthand{russian}{"'}{\glqq}
56.293 \declare@shorthand{russian}{"'}{\grqq}
56.294 \declare@shorthand{russian}{"<}{\flqq}
56.295 \declare@shorthand{russian}{">}{\frqq}

Some additional commands:
56.296 \declare@shorthand{russian}{""}{\hskip\z@skip}
```

The next two macros for "- and "--- are somewhat different. We must check whether the second token is a hyphen character:

```
56.302 \declare@shorthand{russian}{"-}{%
```

If the next token is '-', we typeset an emdash, otherwise a hyphen sign:

```
56.303 \def\russian@sh@tmp{%
56.304 \if\russian@sh@next-\expandafter\russian@sh@emdash
56.305 \else\expandafter\russian@sh@hyphen\fi
56.306 }%
```

TEX looks for the next token after the first '-': the meaning of this token is written to \russian@sh@next and \russian@sh@tmp is called.

```
56.307 \futurelet\russian@sh@next\russian@sh@tmp}
```

Here are the definitions of hyphen and emdash. First the hyphen:

For the emdash definition, there are the two parameters: we must 'eat' two last hyphen signs of our emdash...:

\cdash ... these two parameters are useful for another macro: \cdash:

second parameter (or third for \cdash) shows what kind of emdash to create in next step

"--- ordinary (plain) Cyrillic emdash inside text: an unbreakable thinspace will be inserted before only in case of a *space* before the dash (it is necessary for dashes after display maths formulae: there could be lists, enumerations etc. started with "— where a is ..." i.e., the dash starts a line). (Firstly there were planned rather soft rules for user: he may put a space before the dash or not. But it is difficult to place this thinspace automatically, i.e., by checking modes because after display formulae T<sub>E</sub>X uses horizontal mode. Maybe there is a misunderstanding? Maybe there is another way?) After a dash a breakable thinspace is always placed;

--~ emdash in compound names or surnames (like Mendeleev-Klapeiron); this dash has no space characters around; after the dash some space is added \exhyphenalty

```
56.321 \def\@Bcdash{\leavevmode\ifdim\lastskip>\z@\unskip\fi
56.322 \nobreak\cyrdash\penalty\exhyphenpenalty\hskip\z@skip\ignorespaces}%
```

"--\* for denoting direct speech (a space like \enskip must follow the emdash);

```
56.323 \def\@Ccdash{\leavevmode
56.324 \nobreak\cyrdash\nobreak\hskip.35em\ignorespaces}%
56.325 %\fi
```

\cyrdash Finally the macro for "body" of the Cyrillic emdash. The \cyrdash macro will be defined in case this macro hasn't been defined in a fontenc file. For T2\* fonts, cyrdash will be placed in the code of the English emdash thus it uses ligature ---.

```
56.326 % Is there an IF necessary?
56.327 \ifx\cyrdash\undefined
56.328 \def\cyrdash{\hbox to.8em{--\hss--}}
56.329 \fi
```

Here a really new macro—to place thinspace between initials. This macro used instead of \, allows hyphenation in the following surname.

```
56.330 \label{lem:condition} $$ 56.330 \end{case} $$ 10.330 \end{case} $$ 56.330 \end{case} $$ 10.330 \end{case}
```

The Russian hyphenation patterns can be used with \lefthyphenmin and \righthyphenmin set to 2.

```
56.333 \providehyphenmins{\CurrentOption}{\tw@\tw@} 56.334 % temporary hack: 56.335 \ifx\englishhyphenmins\undefined 56.336 \def\englishhyphenmins{\tw@\thr@@} 56.337 \fi
```

Now the action \extrasrussian has to execute is to make sure that the command \frenchspacing is in effect. If this is not the case the execution of \noextrasrussian will switch it off again.

```
56.338 \verb| addto | extrasrussian{ | bbl@frenchspacing} \\ 56.339 \verb| addto | noextrasrussian{ | bbl@nonfrenchspacing} \\
```

Next we add a new enumeration style for Russian manuscripts with Cyrillic letters, and later on we define some math operator names in accordance with Russian typesetting traditions.

\Asbuk We begin by defining \Asbuk which works like \Alph, but produces (uppercase) Cyrillic letters intead of Latin ones. The letters YO, ISHRT, HRDSN, ERY, and SFTSN are skipped, as usual for such enumeration.

```
56.340 \def\Asbuk#1{\expandafter\@Asbuk\csname c@#1\endcsname}
56.341 \def\@Asbuk#1{\ifcase#1\or
56.342 \CYRA\or\CYRB\or\CYRV\or\CYRG\or\CYRD\or\CYRE\or\CYRZH\or
56.343 \CYRZ\or\CYRI\or\CYRK\or\CYRM\or\CYRN\or\CYRO\or
56.344 \CYRP\or\CYRR\or\CYRS\or\CYRT\or\CYRU\or\CYRF\or\CYRH\or
56.345 \CYRC\or\CYRCH\or\CYRSH\or\CYRSHCH\or\CYREV\or\CYRYU\or
56.346 \CYRYA\else\@ctrerr\fi}
```

```
\asbuk The macro \asbuk is similar to \alph; it produces lowercase Russian letters.
```

```
56.347 \def\asbuk#1{\expandafter\@asbuk\csname c@#1\endcsname} 56.348 \def\@asbuk#1{\ifcase#1\or 56.349 \cyra\or\cyrb\or\cyrv\or\cyrg\or\cyrd\or\cyre\or\cyrzh\or 56.350 \cyrz\or\cyri\or\cyrk\or\cyrn\or\cyrn\or\cyro\or 56.351 \cyrp\or\cyrr\or\cyrs\or\cyrt\or\cyru\or\cyrh\or 56.352 \cyrc\or\cyrch\or\cyrsh\or\cyrshch\or\cyrev\or\cyryu\or 56.353 \cyrya\else\@ctrerr\fi}
```

Set up default Cyrillic math alphabets. To use Cyrillic letters in math mode user should load the textmath package before loading fontenc package (or babel). Note, that by default Cyrillic letters are taken from upright font in math mode (unlike Latin letters).

```
(unlike Latin letters).

56.393 \det Proj{\mathbf{\cyrmathrm{\CYRP\cyrr}}\nolimits}
                 This is for compatibility with older Russian packages.
56.394 \DeclareRobustCommand{\No}{\%}
                       \label{lem:lemmode} $$ \left( \frac{\textnumero}{\textnumero} \right) = \textnumero \ i} $$
                 The macro \ldf@finish takes care of looking for a configuration file, setting
        the main language to be switched on at \begin{document} and resetting the
        category code of @ to its original value.
```

# 57 The Bulgarian language

The file  $\mathtt{bulgarian.dtx}^{68}$  provides the language-specific macros for the Bulgarian language.

Users should take note of the vaious "cyrillic" dashes available now (see below). These should remove many causes of headache. Also, although by default the Bulgarian quotation marks will appear automatically when typesetting in Bulgarian, it is better to use the new commands \"' and \"' which explicitly typeset them. Note: automatic switch to Bulgarian quotation is withdrawn for the moment and may not be reintroduced at all.

For this language the character " is made active. In table 32 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "--- Cyrillic emdash in plain text.
- "--~ Cyrillic emdash in compound names (surnames).
- "--\* Cyrillic emdash for denoting direct speech.
- "" like "-, but producing no hyphen sign (for compound words with hyphen, e.g. x-""y or some other signs as "disable/enable").
- " for a compound word mark without a breakpoint.
- "= for a compound word mark with a breakpoint, allowing hyphenation in the composing words.
- ", thinspace for initials with a breakpoint in following surname.
- "' for German left double quotes (looks like ").
- "' for German right double quotes (looks like ").
- "< for French left double quotes (looks like  $\ll$ ).
- "> for French right double quotes (looks like >>>).

Table 32: The extra definitions made bybulgarian

The quotes in table 32 can also be typeset by using the commands in table 33. The French quotes are also available as ligatures '<<' and '>>' in 8-bit Cyrillic font encodings (LCY, X2, T2\*) and as '<' and '>' characters in 7-bit Cyrillic font encodings (OT2 and LWN).

The quotation marks traditionally used in Bulgarian were borrowed from German o they keep their original names. French quotation marks may be seen as well in older books.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

57.1 **(\*code)** 

### 57.2 \Ldf Init{bulgarian} { captions bulgarian}

<sup>&</sup>lt;sup>68</sup>The file described in this section has version number? and was last revised on?. This file was initially derived from the August-1998 version of russianb.dtx.

It is (reasonably) backward compatible with the 1994/1996 (non-babel) bulgarian style (bulgaria.sty) by Georgi Boshnakov—files prepared for that style should compile successfully (with vastly improved appearance due to usage of standard fonts).

```
\cdash---
             Cyrillic emdash in plain text.
\cdash--~
             Cyrillic emdash in compound names (surnames).
\cdash--*
             Cyrillic emdash for denoting direct speech.
             for German left double quotes (looks like,,).
\glqq
\grqq
             for German right double quotes (looks like ").
\flqq
             for French left double quotes (looks like \ll).
             for French right double quotes (looks like >>>).
\frqq
             the original quotes character (").
\dq
```

Table 33: More commands which produce quotes, defined by babel

When this file is read as an option, i.e., by the \usepackage command, bulgarian will be an 'unknown' language, in which case we have to make it known. So we check for the existence of \lobulgarian to see whether we have to do something here.

```
57.3 \ifx\l@bulgarian\@undefined

57.4 \@nopatterns{Bulgarian}

57.5 \adddialect\l@bulgarian0

57.6 \fi
```

\latinencoding

We need to know the encoding for text that is supposed to be which is active at the end of the babel package. If the fontenc package is loaded later, then ... too bad!

```
57.7 \let\latinencoding\cf@encoding
```

The user may choose between different available Cyrillic encodings—e.g., X2, LCY, or LWN. If the user wants to use a font encoding other than the default (T2A), he has to load the corresponding file *before* bulgarian.sty. This may be done in the following way:

```
\usepackage[LCY,OT1]{fontenc} %overwrite the default encoding; \usepackage[english,bulgarian]{babel}
```

Note: most people would prefer the T2A to X2, because X2 does not contain Latin letters, and users should be very careful to switch the language every time they want to typeset a Latin word inside a Bulgarian phrase or vice versa. On the other hand, switching the language is a good practice anyway. With a decent text processing program it does not involve more work than switching between the Bulgarian and English keyboard. Moreover that the far most common disruption occurs as a result of forgetting to switch back to cyrillic keyboard.

We parse the \cdp@list containing the encodings known to IATEX in the order they were loaded. We set the \cyrillicencoding to the *last* loaded encoding in the list of supported Cyrillic encodings: OT2, LWN, LCY, X2, T2C, T2B, T2A, if any.

```
57.8 \def\reserved@a#1#2{%
57.9 \edef\reserved@b{#1}%
57.10 \edef\reserved@c{#2}%
57.11 \ifx\reserved@b\reserved@c
57.12 \let\cyrillicencoding\reserved@c
57.13 \fi}
```

```
57.14 \def\cdp@elt#1#2#3#4{%
57.15 \reserved@a{#1}{UVN}%
57.16 \reserved@a{#1}{LWN}%
57.17 \reserved@a{#1}{LCY}%
57.18 \reserved@a{#1}{X2}%
57.19 \reserved@a{#1}{T2C}%
57.20 \reserved@a{#1}{T2B}%
57.21 \reserved@a{#1}{T2A}}
57.22 \cdp@list
```

Now, if \cyrillicencoding is undefined, then the user did not load any of supported encodings. So, we have to set \cyrillicencoding to some default value. We test the presence of the encoding definition files in the order from less preferable to more preferable encodings. We use the lowercase names (i.e., lcyenc.def instead of LCYenc.def).

```
57.23 \ifx\cyrillicencoding\undefined
57.24 \IfFileExists{ot2enc.def}{\def\cyrillicencoding{OT2}}\relax
57.25 \IfFileExists{lwnenc.def}{\def\cyrillicencoding{LWN}}\relax
57.26 \IfFileExists{lcyenc.def}{\def\cyrillicencoding{LCY}}\relax
57.27 \IfFileExists{x2enc.def}{\def\cyrillicencoding{X2}}\relax
57.28 \IfFileExists{t2cenc.def}{\def\cyrillicencoding{T2C}}\relax
57.29 \IfFileExists{t2benc.def}{\def\cyrillicencoding{T2B}}\relax
57.30 \IfFileExists{t2aenc.def}{\def\cyrillicencoding{T2A}}\relax
```

If \cyrillicencoding is still undefined, then the user seems not to have a properly installed distribution. A fatal error.

```
57.31 \ifx\cyrillicencoding\undefined

     57.93 \def\@tempa#1\@nil{#1}%
     57.95 \def\do#1"#2{}
     57.96 \def\@tempd#1{\expandafter\@tempb#1\@nil}
     57.97 \ifnum\@tempc>"FFF
     57.99 \fi}
 57.100 \@tempd\hat\@tempd\check\@tempd\tilde\@tempd\acute\@tempd\grave
 57.101 \ensuremath{\texttt{0tempd}}\dot\ensuremath{\texttt{0tempd}}\breve\ensuremath{\texttt{0tempd}}\breve
57.102 \fi
57.103 \endgroup
```

The user should use the inputenc package when any 8-bit Cyrillic font encoding is used, selecting one of the Cyrillic input encodings. We do not assume any default input encoding, so the user should explicitly call the inputenc package by \usepackage{inputenc}. We also removed \AtBeginDocument, so inputenc should be used before babel.

```
57.104 \@ifpackageloaded{inputenc}{}{%
57.105 \def\reserved@a{LWN}%
57.106 \ifx\reserved@a\cyrillicencoding\else
57.107 \def\reserved@a{OT2}%
57.108 \ifx\reserved@a\cyrillicencoding\else
57.109 \PackageWarning{babel}%
57.110 {No input encoding specified for Bulgarian language}\fi\fi}
```

Now we define two commands that offer the possibility to switch between Cyrillic and Roman encodings.

\cyrillictext \latintext

The command \cyrillictext will switch from Latin font encoding to the Cyrillic font encoding, the command \latintext switches back. This assumes that the 'normal' font encoding is a Latin one. These commands are *declarations*, for shorter peaces of text the commands \textlatin and \textcyrillic can be used.

We comment out \latintext since it is defined in the core of babel (babel.def). We add the shorthand \lat for \latintext. Note that \cyrillictext has been defined above.

```
57.111 % \DeclareRobustCommand{\latintext}{% 57.112 % \fontencoding{\latinencoding}\selectfont 57.113 % \def\encodingdefault{\latinencoding}} 57.114 \let\lat\latintext
```

\textcyrillic These commands take an argument which is then typeset using the requested font encoding. \textlatin is commented out since it is defined in the core of babel. (It is defined there with \DeclareRobustCommand instead.)

```
57.115 \label{textcyrillic} $\{\cyrillictext\} $ \\ 57.116 \% \label{textcyrillic} $\{\cyrillictext\} $ \\
```

The next step consists of defining commands to switch to (and from) the Bulgarian language.

#### \captionsbulgarian

The macro \captionsbulgarian defines all strings used in the four standard document classes provided with LATEX. The two commands \cyr and \lat activate Cyrillic resp. Latin encoding.

```

57.174
57.175
       \def\month@Roman{\expandafter\@Roman\month}%
        \def\today{\number\day~\month@bulgarian\ \number\year~\cyrg.}%
57.176
        \def\todayRoman{\number\day.\,\month@Roman.\,\number\year~\cyrg.}%
57.177
57.178 }
```

\todayRoman The month is often written with roman numbers in Bulgarian dates. Here we define date in this format:

```
57.179 \def\Romannumeral #1{\uppercase\expandafter{\romannumeral #1}}
57.180 \def\todayRoman{\number\day.\Romannumeral{\month}.\number\year^\cyrg.}
```

\extrasbulgarian The macro \extrasbulgarian will perform all the extra definitions needed for the Bulgarian language. The macro \noextrasbulgarian is used to cancel the actions of \extrasbulgarian.

> The first action we define is to switch on the selected Cyrillic encoding whenever we enter 'bulgarian'.

```
57.181 \addto\extrasbulgarian{\cyrillictext}
```

When the encoding definition file was processed by LATEX the current font encoding is stored in \latinencoding, assuming that LATEX uses T1 or OT1 as default. Therefore we switch back to \latinencoding whenever the Bulgarian language is no longer 'active'.

```
57.182 \addto\noextrasbulgarian{\latintext}
```

For Bulgarian the "character also is made active.

```
57.183 \initiate@active@char{"}
```

The code above is necessary because we need extra active characters. The character " is used as indicated in table 32. We specify that the Bulgarian group of shorthands should be used.

#### 57.184 \addto\extrasbulgarian{\languageshorthands{bulgarian}}

These characters are 'turned on' once, later their definition may vary.

```
57.185 \addto\extrasbulgarian{%
57.186 \bbl@activate{"}}
57.187 \addto\noextrasbulgarian{%
57.188 \bbl@deactivate{"}}
```

The X2 and T2\* encodings do not contain spanish\_shriek and spanish\_query symbols; as a consequence, the ligatures '?' and '!' do not work with them (these characters are useless for Cyrillic texts anyway). But we define the shorthands to emulate these ligatures (optionally).

We do not use \latinencoding here (but instead explicitly use OT1) because the user may choose T2A to be the primary encoding, but it does not contain these characters.

```
57.189 \* spanishligs \* \\ 57.190 \* declare@shorthand{bulgarian} \* \{?'\} \{\UseTextSymbol\{0T1\} \textquestiondown\} \\ 57.191 \* declare@shorthand\{bulgarian\} \* \{!'\} \{\UseTextSymbol\{0T1\} \textexclamdown\} \\ 57.192 \end{substitute}
```

To be able to define the function of '"', we first define a couple of 'support' macros.

\dq We save the original double quote character in \dq to keep it available, the math accent \"can now be typed as '"'.

```
57.193 \begingroup \catcode'\"12

57.194 \def\reserved@a{\endgroup

57.195 \def\@SS{\mathchar"7019}

57.196 \def\dq{"}}

57.197 \reserved@a
```

Now we can define the double quote macros: german and french quotes. We use definitions of these quotes made in babel. sty. The french quotes are contained in the T2\* encodings.

```
57.198 \ declare@shorthand{bulgarian}{"'}{\grqq} \\ 57.199 \ declare@shorthand{bulgarian}{"'}{\grqq} \\ 57.200 \ declare@shorthand{bulgarian}{"<}{\frqq} \\ 57.201 \ declare@shorthand{bulgarian}{">}{\frqq}
```

Some additional commands:

The next two macros for "- and "--- are somewhat different. We must check whether the second token is a hyphen character:

```
57.208 \declare@shorthand{bulgarian}{"-}{%
```

If the next token is '-', we typeset an emdash, otherwise a hyphen sign:

```
57.209 \def\bulgarian@sh@tmp{%
57.210 \if\bulgarian@sh@next-\expandafter\bulgarian@sh@emdash
57.211 \else\expandafter\bulgarian@sh@hyphen\fi
57.212 }%
```

TEX looks for the next token after the first '-': the meaning of this token is written to \bulgarian@sh@next and \bulgarian@sh@tmp is called.

```
57.213 \qquad \texttt{futurelet\_bulgarian@sh@next\_bulgarian@sh@tmp} \\
```

Here are the definitions of hyphen and emdash. First the hyphen:

```
57.214 \def\bulgarian@sh@hyphen{\nobreak\-\bbl@allowhyphens}
```

For the emdash definition, there are the two parameters: we must 'eat' two last hyphen signs of our emdash . . . :

```
57.215 \det \beta = 142{\cosh emdash #1 #2{\cosh emdash #1 #2}}
```

\cdash ... these two parameters are useful for another macro: \cdash:

```
 57.216 \left| fx \right| $$ fix \cdash\undefined % should be defined earlier $$ 57.217 \left| def \cdash#1#2#3{\left| def \right|^*} \right| $$ 57.218 \left| def \right|^* \right| $$ fix \cdashelse $$ 57.219 \left| fx \right|^* \left| def \right|^* \right| $$ fix \cdashelse $$ 57.220 \left| fx \right|^* \left| def \right|^* \right| $$ fix \cdashelse $$ 57.221 \left| fx \right|^* \left| def \right|^* \right| $$ fix \cdashelse $$ 57.222 \left| def \right|^* \right| $$ fix \cdashelse $$ 57.222 \left| def \right|^* \right| $$ fix \cdashelse $$ 57.222 \left| def \right|^* \right| $$ fix \cdashelse $$ fix \cda
```

second parameter (or third for \cdash) shows what kind of emdash to create in next step

"--- ordinary (plain) Cyrillic emdash inside text: an unbreakable thinspace will be inserted before only in case of a *space* before the dash (it is necessary for dashes after display maths formulae: there could be lists, enumerations etc. started with "—where a is ..." i.e., the dash starts a line). (Firstly there were planned rather soft rules for user:he may put a space before the dash or not. But it is difficult to place this thinspace automatically, i.e., by checking modes because after display formulae T<sub>E</sub>X uses horizontal mode. Maybe there is a misunderstanding? Maybe there is another way?) After a dash a breakable thinspace is always placed;

```
57.223 % What is more grammatically: .2em or .2\fontdimen6\font? 57.224 \end{ship}\z@\unskip\nobreak\hskip.2em\fi <math display="inline">57.225 \cyrdash\hskip.2em\gnorespaces}%
```

"--" emdash in compound names or surnames (like Mendeleev-Klapeiron); this dash has no space characters around; after the dash some space is added \exhyphenalty

```
57.226 \def\@Bcdash{\leavevmode\ifdim\lastskip>\z@\unskip\fi
57.227 \nobreak\cyrdash\penalty\exhyphenpenalty\hskip\z@skip\ignorespaces}%
```

"--\* for denoting direct speech (a space like \enskip must follow the emdash);

```
57.228 \def\@Ccdash{\leavevmode

57.229 \nobreak\cyrdash\nobreak\hskip.35em\ignorespaces}%

57.230 %\fi
```

\cyrdash Finally the macro for "body" of the Cyrillic emdash. The \cyrdash macro will be defined in case this macro hasn't been defined in a fontenc file. For T2\*fonts, cyrdash will be placed in the code of the English emdash thus it uses ligature ---.

```
57.231 % Is there an IF necessary?
57.232 \ifx\cyrdash\undefined
57.233 \def\cyrdash{\hbox to.8em{--\hss--}}
57.234 \fi
```

Here a really new macro—to place thinspace between initials. This macro used instead of \, allows hyphenation in the following surname.

```
57.235 \declare@shorthand{bulgarian}{",}{\nobreak\hskip.2em\ignorespaces}
```

The Bulgarian hyphenation patterns can be used with \lefthyphenmin and \righthyphenmin set to 2.

```
57.236 \providehyphenmins{\CurrentOption}{\tw@\tw@} 57.237 \fi
```

Now the action \extrasbulgarian has to execute is to make sure that the command \frenchspacing is in effect. If this is not the case the execution of \noextrasbulgarian will switch it off again.

```
57.238 \addto\extrasbulgarian{\bbl@frenchspacing}
57.239 \addto\noextrasbulgarian{\bbl@nonfrenchspacing}
```

Make the double quotes produce the traditional quotes used in Bulgarian texts (these are the German quotes).

```
57.240 % \initiate@active@char{'}

57.241 % \initiate@active@char{'}

57.242 % \addto\extrasbulgarian{%

57.243 % \bbl@activate{'}}

57.244 % \addto\extrasbulgarian{%

57.245 % \bbl@activate{'}}

57.246 % \addto\noextrasbulgarian{%

57.247 % \bbl@deactivate{'}}

57.248 % \addto\noextrasbulgarian{%

57.249 % \bbl@deactivate{'}}

57.250 % \def\mlron{\bbl@activate{'}\bbl@activate{'}}

57.251 % \def\mlroff{\bbl@deactivate{'}\bbl@deactivate{'}}

57.252 % \declare@shorthand{bulgarian}{''}{\glqq}

57.253 % \declare@shorthand{bulgarian}{''}{\grqq}
```

Next we add a new enumeration style for Bulgarian manuscripts with Cyrillic letters, and later on we define some math operator names in accordance with Bulgarian typesetting traditions.

\@Alph@bul We begin by defining \@Alph@bul which works like \@Alph, but produces (uppercase) Cyrillic letters intead of Latin ones. The letters ISHRT, HRDSN and SFTSN are skipped, as usual for such enumeration.

```
57.254 \end{alph@Alph@Alph@bul \et\@alph\@alph@bul}
57.255 \ensuremath{\mbox{def}\mbox{enumEng{\let}@Alph@eng}}\

         The macro \ldf@finish takes care of looking for a configuration file, setting
   the main language to be switched on at \begin{document} and resetting the
   category code of @ to its original value.
57.321 \ldf@finish{bulgarian}
57.322 (/code)
```

## 58 The Ukrainian language

The file ukraineb.dtx<sup>69</sup> defines all the language-specific macros for the Ukrainian language. It needs the file cyrcod for success documentation with Ukrainian encodings (see below).

For this language the character " is made active. In table 34 an overview is given of its purpose.

- "| disable ligature at this position.
- "- an explicit hyphen sign, allowing hyphenation in the rest of the word.
- "--- Cyrillic emdash in plain text.
- "--~ Cyrillic emdash in compound names (surnames).
- "--\* Cyrillic emdash for denoting direct speech.
- "" like "-, but producing no hyphen sign (for compund words with hyphen, e.g. x-""y or some other signs as "disable/enable").
- " for a compound word mark without a breakpoint.
- "= for a compound word mark with a breakpoint, allowing hyphenation in the composing words.
- ", thinspace for initials with a breakpoint in following surname.
- "' for German left double quotes (looks like ").
- for German right double quotes (looks like ").
- "< for French left double quotes (looks like  $\ll$ ).
- "> for French right double quotes (looks like  $\gg$ ).

Table 34: The extra definitions made by ukraineb

The quotes in table 34 (see, also table 30) can also be typeset by using the commands in table 35 (see, also table 31).

```
\cdash---
             Cyrillic emdash in plain text.
\cdash--~
             Cyrillic emdash in compound names (surnames).
             Cyrillic emdash for denoting direct speech.
\cdash--*
             for German left double quotes (looks like ").
\glqq
\grqq
             for German right double quotes (looks like ").
             for French left double quotes (looks like «).
\flqq
             for French right double quotes (looks like >>>).
\frqq
             the original quotes character (").
\dq
```

Table 35: More commands which produce quotes, defined by babel

The French quotes are also available as ligatures '<<' and '>>' in 8-bit Cyrillic font encodings (LCY, X2, T2\*) and as '<' and '>' characters in 7-bit Cyrillic font encodings (OT2 and LWN).

<sup>&</sup>lt;sup>69</sup>The file described in this section has version number?. This file was derived from the russianb.dtx version 1.1g.

The quotation marks traditionally used in Ukrainian and Russian languages were borrowed from other languages (e.g. French and German) so they keep their original names.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
58.1 \ (*code)
58.2 \ LdfInit{ukrainian}{captionsukrainian}
```

When this file is read as an option, i.e., by the \usepackage command, ukraineb will be an 'unknown' language, in which case we have to make it known. So we check for the existence of \lambda ukrainian to see whether we have to do something here.

```
58.3 \ifx\l@ukrainian\@undefined
58.4 \@nopatterns{Ukrainian}
58.5 \adddialect\l@ukrainian0
58.6 \fi
```

\latinencoding

We need to know the encoding for text that is supposed to be which is active at the end of the babel package. If the fontenc package is loaded later, then...too bad!

```
58.7 \let\latinencoding\cf@encoding
```

The user may choose between different available Cyrillic encodings—e.g., X2, LCY, or LWN. Hopefully, X2 will eventually replace the two latter encodings (LCY and LWN). If the user wants to use another font encoding than the default (T2A), he has to load the corresponding file *before* ukraineb.sty. This may be done in the following way:

```
% override the default X2 encoding used in Babel
\usepackage[LCY,OT1]{fontenc}
\usepackage[english,ukrainian]{babel}
```

Note: for the Ukrainian language, the T2A encoding is better than X2, because X2 does not contain Latin letters, and users should be very careful to switch the language every time they want to typeset a Latin word inside a Ukrainian phrase or vice versa.

We parse the \cdp@list containing the encodings known to LATEX in the order they were loaded. We set the \cyrillicencoding to the *last* loaded encoding in the list of supported Cyrillic encodings: OT2, LWN, LCY, X2, T2C, T2B, T2A, if any.

```
58.8 \def\reserved@a#1#2{%
        \edef\reserved@b{#1}%
58.9
        \edef\reserved@c{#2}%
58.10
58.11
        \ifx\reserved@b\reserved@c
          \let\cyrillicencoding\reserved@c

58.71
```

Unfortunately, the commands \AA and \aa are not encoding dependent in LATEX (unlike e.g., \oe or \DH). They are defined as \r{A} and \r{a}. This leads to unpredictable results when the font encoding does not contain the Latin letters 'A' and 'a' (like X2).

The following block redefines the character class of uppercase Greek letters and some accents, if it is equal to 7 (variable family), to avoid incorrect results if the font encoding in some math family does not contain these characters in places of OT1 encoding. The code was taken from amsmath.dtx. See comments and further explanation there.

```
58.77 % \begingroup\catcode '\"=12
58.78 % % uppercase greek letters:

58.102 % \endgroup
```

The user must use the inputenc package when any 8-bit Cyrillic font encoding is used, selecting one of the Cyrillic input encodings. We do not assume any default input encoding, so the user should explicitly call the inputenc package by \usepackage{inputenc}. We also removed \AtBeginDocument, so inputenc should be used before babel.

```
58.103 \@ifpackageloaded{inputenc}{}{%
58.104
       \def\reserved@a{LWN}%
58.105
       \ifx\reserved@a\cyrillicencoding\else
         \def\reserved@a{0T2}%
58 106
          \ifx\reserved@a\cyrillicencoding\else
58.107
58.108
            \PackageWarning{babel}%
58.109
              {No input encoding specified for Ukrainian language}
58.110
       \fi\fi}
```

Now we define two commands that offer the possibility to switch between Cyrillic and Roman encodings.

\cyrillictext The command \cyrillictext will switch from Latin font encoding to the Cyrillic font encoding, the command \latintext switches back. This assumes that the 'normal' font encoding is a Latin one. These commands are declarations, for shorter peaces of text the commands \textlatin and \textcyrillic can be

```
58.111 %\DeclareRobustCommand{\latintext}{%
58.112 % \fontencoding{\latinencoding}\selectfont
58.113 % \def\encodingdefault{\latinencoding}}
58.114 \left| \text{lat} \right|
```

\textcyrillic These commands take an argument which is then typeset using the requested font \textlatin encoding.

```
58.115 \verb|\DeclareTextFontCommand{\textcyrillic}{\cyrillictext}|
58.116\ \verb|\DeclareTextFontCommand{\textlatin}{\latintext}
```

We make the T<sub>E</sub>X

```
58.117 %\ifx\ltxTeX\undefined\let\ltxTeX\TeX\fi
58.118 \label{lem:commandDefault{TeX}{\text{LtxTeX}}} \\
  and LaTeX logos encoding independent.
58.119 \% ifx \text{$1$txLaTeX} undefined \text{$1$txLaTeX} LaTeX fi
```

The next step consists of defining commands to switch to (and from) the Ukrainian language.

\captionsukrainian

The macro \captionsukrainian defines all strings used in the four standard document classes provided with LATEX. The two commands \cyr and \lat activate Cyrillic resp. Latin encoding.

```
58.121 \addto\captionsukrainian{%

```

 $\ensuremath{\setminus} \mathtt{extrasukrainian}$ 

The macro \extrasukrainian will perform all the extra definitions needed for the Ukrainian language. The macro \noextrasukrainian is used to cancel the actions of \extrasukrainian.

The first action we define is to switch on the selected Cyrillic encoding whenever we enter 'ukrainian'.

```
58.177 \addto\extrasukrainian{\cyrillictext}
```

When the encoding definition file was processed by  $\LaTeX$  the current font encoding is stored in \latinencoding, assuming that  $\LaTeX$  uses T1 or OT1 as default. Therefore we switch back to \latinencoding whenever the Ukrainian language is no longer 'active'.

```
58.178 \addto\noextrasukrainian{\langle latintext \}}
```

Next we must allow hyphenation in the Ukrainian words with apostrophe whenever we enter 'ukrainian'. This solution was proposed by Vladimir Volovich <vyv@yvv.vsu.ru>

```
58.179 \addto\extrasukrainian{\lccode'\'='\'}
58.180 \addto\noextrasukrainian{\lccode'\'=0}
```

\verbatim@font In order to get both Latin and Cyrillic letters in verbatim text we need to change the definition of an internal LATEX command somewhat:

```
58.181 %\def\verbatim@font{%
58.182 % \let\encodingdefault\latinencoding
58.183 % \normalfont\ttfamily
58.184 % \expandafter\def\csname\cyrillicencoding-cmd\endcsname##1##2{%
58.185 % \ifx\protect\@typeset@protect
58.186 % \legingroup\UseTextSymbol\cyrillicencoding##1\endgroup
58.187 % \else\noexpand##1\fi}}
```

The category code of the characters ':', ';', '!', and '?' is made \active to insert a little white space.

For Ukrainian (as well as for Russian and German) the " character also is made active.

Note: It is very questionable whether the Russian typesetting tradition requires additional spacing before those punctuation signs. Therefore, we make the corresponding code optional. If you need it, then define the frenchpunct docstrip option in babel.ins.

Borrowed from french. Some users dislike automatic insertion of a space before 'double punctuation', and prefer to decide themselves whether a space should be added or not; so a hook \NoAutoSpaceBeforeFDP is provided: if this command is added (in file ukraineb.cfg, or anywhere in a document) ukraineb will respect your typing, and introduce a suitable space before 'double punctuation' if and only if a space is typed in the source file before those signs.

The command \AutoSpaceBeforeFDP switches back to the default behavior of ukraineb.

```
58.188 (*frenchpunct)
58.189 \initiate@active@char{:}
58.190 \initiate@active@char{;}
58.191 \/frenchpunct\)
58.192 \*frenchpunct | spanishligs\)
58.193 \initiate@active@char{!}
58.194 \initiate@active@char{?}
58.195 \/frenchpunct | spanishligs\)
58.196 \initiate@active@char{"}
```

The code above is necessary because we need extra active characters. The character " is used as indicated in table 34.

We specify that the Ukrainian group of shorthands should be used.

```
58.197 \addto\extrasukrainian{\languageshorthands{ukrainian}}
```

These characters are 'turned on' once, later their definition may vary.

The X2 and T2\* encodings do not contain spanish\_shriek and spanish\_query symbols; as a consequence, the ligatures '?' and '!' do not work with them (these characters are useless for Cyrillic texts anyway). But we define the shorthands to emulate these ligatures (optionally).

We do not use \latinencoding here (but instead explicitly use OT1) because the user may choose T2A to be the primary encoding, but it does not contain these characters.

\ukrainian@sh@;@ We have to reduce the amount of white space before;, : and !. This should only \ukrainian@sh@:@ happen in horizontal mode, hence the test with \ifhmode.

```
\label{eq:continuous} $$ \ukrainian@sh@?_{88.210} \endowner-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuous-continuo-continuo-continuo
```

In horizontal mode we check for the presence of a 'space', 'unskip' if it exists and place a 0.1em kerning.

```
58.213 \ifdim\lastskip>\z@

58.214 \unskip\nobreak\kern.1em

58.215 \else
```

If no space has been typed, we add \FDP@thinspace which will be defined, up to the user's wishes, as an automatic added thinspace, or as \@empty.

```
58.216 \FDP@thinspace
58.217 \fi
58.218 \fi
```

```
Now we can insert a ';' character.

                     58.252
                                    \bbl@activate{?}%
                     58.253
                                   \bbl@activate{!}}
                     58.254
                     58.255 \def\FDPoff{\bbl@deactivate{:}%
                                    \bbl@deactivate{;}%
                     58.256
                                    \bbl@deactivate{?}%
                     58.257
                     58.258
                                    \bbl@deactivate{!}}
        \system@sh@:@ When the active characters appear in an environment where their Ukrainian be-
                        haviour is not wanted they should give an 'expected' result. Therefore we define
        \system@sh@!@
                        shorthands at system level as well.
        \system@sh@?@
```

\system@sh@;@

To be able to define the function of '"', we first define a couple of 'support' macros.

\dq We save the original double quote character in \dq to keep it available, the math accent \" can now be typed as '"'.

```
58.266 \begingroup \catcode'\"12
58.267 \def\reserved@a{\endgroup
58.268 \def\@SS{\mathchar"7019 }
58.269 \def\dq{"}}
58.270 \reserved@a
```

Now we can define the double quote macros: german and french quotes. We use definitions of these quotes made in babel. sty. The french quotes are contained in the T2\* encodings.

```
58.271 \declare@shorthand{ukrainian}{"'}{\glqq}
58.272 \declare@shorthand{ukrainian}{"'}}{\grqq}
58.273 \declare@shorthand{ukrainian}{"'}{\flqq}
58.274 \declare@shorthand{ukrainian}{"'}}{\frqq}
```

Some additional commands:

The next two macros for "- and "--- are somewhat different. We must check whether the second token is a hyphen character:

```
58.281 \declare@shorthand{ukrainian}{"-}{%
```

If the next token is '-', we typeset an emdash, otherwise a hyphen sign:

```
58.282 \def\ukrainian@sh@tmp{%
58.283 \if\ukrainian@sh@next-\expandafter\ukrainian@sh@emdash
58.284 \else\expandafter\ukrainian@sh@hyphen\fi
58.285 }%
```

TEX looks for the next token after the first '-': the meaning of this token is written to \ukrainian@sh@next and \ukrainian@sh@tmp is called.

```
58.286 \futurelet\ukrainian@sh@next\ukrainian@sh@tmp}
```

Here are the definitions of hyphen and emdash. First the hyphen:

```
58.287 \end{figure} $58.288 \end{figure} $$ \end{figure} $$ 18.288 \end{figure} $$ \end{figure} $$ 18.288 \end{figure} $$ 18.2888 \end{figure} $$
```

For the emdash definition, there are the two parameters: we must 'eat' two last hyphen signs of our emdash...:

```
58.289 \def\ukrainian@sh@emdash#1#2{\cdash-#1#2}
```

\cdash ... these two parameters are useful for another macro: \cdash:

second parameter (or third for \cdash) shows what kind of emdash to create in next step

"--- ordinary (plain) Cyrillic emdash inside text: an unbreakable thinspace will be inserted before only in case of a *space* before the dash (it is necessary for dashes after display maths formulae: there could be lists, enumerations etc. started with "— where a is ..." i.e., the dash starts a line). (Firstly there were planned rather soft rules for user: he may put a space before the dash or not. But it is difficult to place this thinspace automatically, i.e., by checking modes because after display formulae TEX uses horizontal mode. Maybe there is a misunderstanding? Maybe there is another way?) After a dash a breakable thinspace is always placed;

```
58.297\,\% What is more grammatically: .2em or .2\fontdimen6\font ? 58.298\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha\def\alpha
```

"--" emdash in compound names or surnames (like Mendeleev-Klapeiron); this dash has no space characters around; after the dash some space is added \exhyphenalty

```
58.300 \def\@Bcdash{\leavevmode\ifdim\lastskip>\z@\unskip\fi
58.301 \nobreak\cyrdash\penalty\exhyphenpenalty\hskip\z@skip\ignorespaces}%
```

"--\* for denoting direct speech (a space like \enskip must follow the emdash);

```
58.302 \def\@Ccdash{\leavevmode
58.303 \nobreak\cyrdash\nobreak\hskip.35em\ignorespaces}%
58.304 %\fi
```

\cyrdash Finally the macro for "body" of the Cyrillic emdash. The \cyrdash macro will be defined in case this macro hasn't been defined in a fontenc file. For T2\* fonts, cyrdash will be placed in the code of the English emdash thus it uses ligature ---.

```
58.305 % Is there an IF necessary?
58.306 \ifx\cyrdash\undefined
58.307 \def\cyrdash{\hbox to.8em{--\hss--}}
58.308 \fi
```

Here a really new macro—to place thinspace between initials. This macro used instead of \, allows hyphenation in the following surname.

 $58.309 \declare@shorthand{ukrainian}{",}{\nobreak\hskip.2em\ignorespaces}$ 

The Ukrainian hyphenation patterns can be used with \lefthyphenmin and \righthyphenmin set to 2.

```
58.312 \providehyphenmins{\CurrentOption}{\tw@\tw@}

58.313 % temporary hack:

58.314 \ifx\englishhyphenmins\undefined

58.315 \def\englishhyphenmins{\tw@\thr@@}

58.316 \fi
```

Now the action \extrasukrainian has to execute is to make sure that the command \frenchspacing is in effect. If this is not the case the execution of \noextrasukrainian will switch it off again.

```
58.317 \addto\extrasukrainian{\bbl@frenchspacing}
58.318 \addto\noextrasukrainian{\bbl@nonfrenchspacing}
```

Next we add a new enumeration style for Ukrainian manuscripts with Cyrillic letters, and later on we define some math operator names in accordance with Ukrainian and Russian typesetting traditions.

\Asbuk We begin by defining \Asbuk which works like \Alph, but produces (uppercase) Cyrillic letters intead of Latin ones. The letters CYRGUP, and SFTSN are skipped, as usual for such enumeration.

```
58.319 \def\Asbuk#1{\expandafter\@Asbuk\csname c@#1\endcsname}
58.320 \def\@Asbuk#1{\ifcase#1\or
58.321 \CYRA\or\CYRB\or\CYRV\or\CYRG\or\CYRD\or\CYRE\or\CYRIE\or
58.322 \CYRZH\or\CYRZ\or\CYRI\or\CYRII\or\CYRYI\or\CYRSHRT\or
58.323 \CYRK\or\CYRL\or\CYRM\or\CYRO\or\CYRP\or\CYRR\or
58.324 \CYRS\or\CYRT\or\CYRV\or\CYRF\or\CYRH\or\CYRC\or\CYRC\or
58.325 \CYRSH\or\CYRSHCH\or\CYRYU\or\CYRYA\else\@ctrerr\fi}
```

\asbuk The macro \asbuk is similar to \alph; it produces lowercase Ukrainian letters.

```
58.326 \def\asbuk#1{\expandafter\@asbuk\csname c@#1\endcsname}
58.327 \def\@asbuk#1{\ifcase#1\or
58.328 \cyra\or\cyrb\or\cyrv\or\cyrg\or\cyrd\or\cyre\or\cyrie\or
58.329 \cyrzh\or\cyrz\or\cyri\or\cyrii\or\cyryi\or\cyrishrt\or
58.330 \cyrk\or\cyrl\or\cyrm\or\cyrn\or\cyro\or\cyrr\or
58.331 \cyrs\or\cyrt\or\cyru\or\cyrf\or\cyrh\or\cyrc\or\cyrch\or
58.332 \cyrsh\or\cyrshch\or\cyryu\or\cyrya\else\@ctrerr\fi}
```

Set up default Cyrillic math alphabets. The math groups for cyrillic letters are defined in the encoding definition files. First, declare a new alphabet for symbols, \cyrmathrm, based on the symbol font for Cyrillic letters defined in the encoding definition file. Note, that by default Cyrillic letters are taken from upright font in math mode (unlike Latin letters).

```
58.333 %RequirePackage{textmath}
58.334 \@ifundefined{sym\cyrillicencoding letters}{}{%
58.335 \SetSymbolFont{\cyrillicencoding letters}{bold}\cyrillicencoding
58.336 \rmdefault\bfdefault\updefault
58.337 \DeclareSymbolFontAlphabet\cyrmathrm{\cyrillicencoding letters}
```

```
And we need a few commands to be able to switch to different variants.
58.338 \DeclareMathAlphabet\cyrmathbf\cyrillicencoding
               \rmdefault\bfdefault\updefault
58.340 \DeclareMathAlphabet\cyrmathsf\cyrillicencoding

```

This is for compatibility with older Ukrainian packages.

```
58.377 \DeclareRobustCommand{\No}{%
58.378 \ifnmode{\nfss@text{\textnumero}}\else\textnumero\fi}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
58.379 \ldf@finish{ukrainian} 58.380 \langle /code \rangle
```

# 59 The Lower Sorbian language

The file  $1sorbian.dtx^{70}$  It defines all the language-specific macros for Lower Sorbian

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
59.1 (*code)
59.2 \Ldf Init\CurrentOption{date\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, lsorbian will be an 'unknown' language, in which case we have to make it known. So we check for the existence of \l@lsorbian to see whether we have to do something here. As babel also knwos the option lowersorbian we have to check that as well.

```
59.3 \ifx\l@lowersorbian\@undefined
      \ifx\l@lsorbian\@undefined
59.5
         \@nopatterns{Lsorbian}
         \adddialect\l@lsorbian\z@
59.6
         \let\l@lowersorbian\l@lsorbian
59.7
      \else
59.8
         \let\l@lowersorbian\l@lsorbian
59.9
      \fi
59.10
59.11 \else
59.12
     \let\l@lsorbian\l@lowersorbian
59.13 \fi
```

The next step consists of defining commands to switch to (and from) the Lower Sorbian language.

\captionslsorbian The macro \captionslsorbian defines all strings used in the four standard document classes provided with LATEX.

```

```

The default will be the new-style dates.

```
60.49 \exp \text{Addet} = \text{CurrentOption} = \text{Coname date} \subset \text{CurrentOption} = \text{Coname newdate} \subset \text{CurrentOption} = \text{Coname newdate} = \text{Coname ne
```

\extrasusorbian The macro \extrasusorbian will perform all the extra definitions needed for the Upper Sorbian language. It's pirated from germanb.sty. The macro \noextrasusorbian is used to cancel the actions of \extrasusorbian.

Because for Upper Sorbian (as well as for Dutch) the "character is made active. This is done once, later on its definition may vary.

Don't forget to turn the shorthands off again.

```
60.55 \exp \text{andafter} \ csname extras\CurrentOption\endcsname{\% } 60.56 \bbl@deactivate{"}}
```

In order for  $T_EX$  to be able to hyphenate German Upper Sorbian words which contain 'ß' we have to give the character a nonzero \lccode (see Appendix H, the  $T_EX$ book). As some of the other language definitions turn the character  $\hat{}$  into a shorthand we need to make sure that it has it's original definition here.

```
60.57 \begingroup \catcode'\^7
60.58 \def\x{\endgroup}
60.59 \expandafter\addto\csname extras\CurrentOption\endcsname{%
60.60 \babel@savevariable{\lccode'\^^Y}%
60.61 \lccode'\^^Y'\^^Y}}
60.62 \x
```

The umlaut accent macro \" is changed to lower the umlaut dots. The redefinition is done with the help of \umlautlow.

60.63 \expandafter\addto\csname extras\CurrentOption\endcsname{%

```
\babel@save\"\umlautlow}
     60.65 \verb|\expandafter\addto\csname| noextras\CurrentOption\endcsname {\%}
               \umlauthigh}
         The Upper Sorbian hyphenation patterns can be used with \lefthyphenmin and
         \righthyphenmin set to 2.
     60.67 \providehyphenmins{\CurrentOption}{\tw@\tw@}
\dq We save the original double quote character in \dq to keep it available, the math
         accent \" can now be typed as ". Also we store the original meaning of the
         command \" for future use.
     60.68 \begingroup \catcode '\"12
     60.69 \def\x{\endgroup
                \def\@SS{\mathchar"7019 }
     60.70
                 \left( dq{"} \right)
     60.71
     60.72 \x
               Now we can define the doublequote macros: the umlauts,
     60.73 \declare@shorthand{usorbian}{"a}{\text{textormath}}{"{a}}{\dot a}}
     60.74 \end{usorbian} \end{usorbian

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

```
61.78 \label{finish} furkish 61.79 \cdot /code
```

# 62 The Hebrew language

The file hebrew.dtx<sup>74</sup> provides the following packages and files for Hebrew language support:

hebrew.ldf file defines all the language-specific macros for the Hebrew language.

rlbabel.def file is used by hebrew.ldf for bidirectional versions of the major LATEX commands and environments. It is designed to be used with other right-to-left languages, not only with Hebrew.

hebcal.sty package defines a set of macros for computing Hebrew date from Gregorian one.

Additional Hebrew input and font encoding definition files that should be included and used with hebrew.ldf are:

hebinp.dtx provides Hebrew input encodings, such as ISO 8859-8, MS Windows codepage 1255 or IBM PC codepage 862 (see Section 63 on page 422).

hebrew.fdd contains Hebrew font encodings, related font definition files and hebfont package that provides Hebrew font switching commands (see Section 64 on page 429 for further details).

LATEX 2.09 compatibility files are included with heb209.dtx and gives possibility to compile existing LATEX 2.09 Hebrew documents with small (if any) changes (see Section 65 on page 446 for details).

Finally, optional document class hebtech may be useful for writing theses and dissertations in both Hebrew and English (and any other languages included with babel). It designed to meet requirements of the Graduate School of the Technion — Israel Institute of Technology.

As of version 2.3e hebtech is no longer distributed together with heblatex. It should be part of a new "hebclasses" package

## 62.1 Acknowledgement

The following people have contributed to Hebrew package in one way or another, knowingly or unknowingly. In alphabetical order: Irina Abramovici, Yaniv Bargury, Yael Dubinsky, Sergio Fogel, Dan Haran, Rama Porrat, Michail Rozman, Alon Ziv.

Tatiana Samoilov and Vitaly Surazhsky found a number of serious bugs in preliminary version of Hebrew package.

A number of other people have contributed comments and information. Specific contributions are acknowledged within the document.

I want to thank my wife, Vita, and son, Mishka, for their infinite love and patience.

If you made a contribution and I haven't mentioned it, don't worry, it was an accident. I'm sorry. Just tell me and I will add you to the next version.

 $<sup>^{74}</sup>$ The Hebrew language support files described in this section have version number v2.3h and were last revised on 2005/03/30.

### 62.2The DOCSTRIP modules

The following modules are used in the implementation to direct DOCSTRIP in generating external files:

> driver produce a documentation driver file hebrew produce Hebrew language support file rightleft create right-to-left support file calendar create Hebrew calendar package

A typical DOCSTRIP command file would then have entries like:

```
\generateFile{hebrew.ldf}{t}{\from{hebrew.dtx}{hebrew}}
```

### 62.3Hebrew language definitions

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
62.2 \LdfInit{hebrew}{captionshebrew}
```

When this file is read as an option, i.e., by the \usepackage command, hebrew will be an 'unknown' language, in which case we have to make it known. So we check for the existence of \lambda@hebrew to see whether we have to do something here.

```
62.3 \ifx\l@hebrew\@undefined
     \@nopatterns{Hebrew}%
     \adddialect\l@hebrew0
62.5
62.6 \fi
```

# $\hfill ext{hebrewencoding} ext{ } FIX DOCS REGARDING 8BIT$

Typesetting Hebrew texts implies that a special input and output encoding needs to be used. Generally, the user may choose between different available Hebrew encodings provided. The current support for Hebrew uses all available fonts from the Hebrew University of Jerusalem encoded in 'old-code' 7-bit encoding also known as Israeli Standard SI-960. We define for these fonts the Local Hebrew Encoding LHE (see the file hebrew.fdd for more details), and the LHE encoding definition file should be loaded by default.

Other fonts are available in windows-cp1255 (a superset of ISO-8859-8 with nikud). For those, the encoding HE8 should be used. Such fonts are, e.g., windows' TrueType fonts (once coverted to Type1 or MetaFont) and IBM's Type1 fonts.

However, if an user wants to use another font encoding, for example, cyrillic encoding T2 and extended latin encoding T1, — he/she has to load the corresponding file before the hebrew package. This may be done in the following way:

```
\usepackage[LHE,T2,T1]{fontenc}
\usepackage[hebrew,russian,english]{babel}
```

We make sure that the LHE encoding is known to LATEX at end of this package. Also note that if you want to use the encoding HE8, you should define the following in your document, before loading babel:

```
\def\HeblatexEncoding{HE8}
\def\HeblatexEncodingFile{he8enc}
```

```
62.7 \providecommand{\HeblatexEncoding}{LHE}%
62.8 \providecommand{\HeblatexEncodingFile}{lheenc}%
62.9 \newcommand{\heblatex@set@encoding} [2] {
62.10 }
62.11 \AtEndOfPackage {%
       \@ifpackageloaded{fontenc}{%
62.12
         \ensuremath{\mbox{\tt 0ifl@aded{def}}{\mbox{\tt %}}}
62.13
            \HeblatexEncodingFile}{\def\hebrewencoding{\HeblatexEncoding}}{}}
62.14
62.15
          \input{\HeblatexEncodingFile.def}%
62.16
          \def\hebrewencoding{\HeblatexEncoding}%
62.17
      }}
62.18
```

We also need to load inputenc package with one of the Hebrew input encodings. By default, we set up the 8859-8 codepage. If an user wants to use many input encodings in the same document, for example, the MS Windows Hebrew codepage cp1255 and the standard IBM PC Russian codepage cp866, he/she has to load the corresponding file before the hebrew package too. This may be done in the following way:

```
\usepackage[cp1255,cp866]{inputenc}
\usepackage[hebrew,russian,english]{babel}
```

An user can switch input encodings in the document using the command \inputencoding, for example, to use the cp1255:

```
\inputencoding{cp1255}
```

```
 \begin{array}{ll} 62.19 \ \texttt{AtEndOfPackage} \{\% \\ 62.20 \ \texttt{Cifpackageloaded} \{inputenc\} \{\} \{\texttt{NequirePackage} [8859-8] \{inputenc\} \}\} \\ \end{array}
```

The next step consists of defining commands to switch to (and from) the Hebrew language.

\hebrewhyphenmins

This macro is used to store the correct values of the hyphenation parameters \lefthyphenmin and \righthyphenmin. They are set to 2.

```
62.21 \providehyphenmins{\CurrentOption}{\tw0}
```

\captionshebrew The macro \captionshebrew replaces all captions used in the four standard document classes provided with  $\LaTeX 2\varepsilon$  with their Hebrew equivalents.

```

  \hebdate The macro \hebdate\{day\}\{month\}\{year\} translates a given Gregorian date to
          62.73 \det \theta = 1#2#3{\%}
                \beginR\beginL\number#1\endL\ \hebbet\hebmonth{#2}
          62.74
          62.75
                       \beginL\number#3\endL\endR}
   \hebday The macro \hebday will replace \today command when in Hebrew mode.
```

 $62.76 \def \hebday{\hebdate{\day}{\month}{\year}}$ 

The macro \datehebrew redefines the command \today to produce Gregorian \datehebrew dates in Hebrew. It uses the macro \hebday.

```
62.77 \def\datehebrew{\let \today=\hebday}
```

The macro \extrashebrew will perform all the extra definitions needed for the Hebrew language. The macro \noextrashebrew is used to cancel the actions of \extrashebrew.

\extrashebrew

We switch font encoding to Hebrew and direction to right-to-left. We cannot use the regular language switching commands (for example, \sethebrew and \unsethebrew or \selectlanguage{hebrew}), when in restricted horizontal mode, because it will result in unbalanced \beginR or \beginL primitives. Instead, in TeX's restricted horizontal mode, the \L{latin text} and \R{hebrew text, or  $\ensuremath{\texttt{\text}}$  and  $\ensuremath{\texttt{\text}}$  should be used.

Hence, we use \beginR and \beginL switching commands only when not in restricted horizontal mode.

```
62.78 \addto\extrashebrew{%
62.79
      \tohebrew%
62.80
      \ifhmode\ifinner\else\beginR\fi\fi}
```

\noextrashebrew The macro \noextrashebrew is used to cancel the actions of \extrashebrew. We switch back to the previous font encoding and restore left-to-right direction.

```
62.81 \addto\noextrashebrew{%
      \fromhebrew%
62.82
62.83
      \ifhmode\ifinner\else\beginL\fi\fi}
```

Generally, we can switch to- and from- Hebrew by means of standard babeldefined commands, for example,

```
\selectlanguage{hebrew}
```

or

```
\begin{otherlanguage}{hebrew}
   some Hebrew text
\end{otherlanguage}
```

Now we define two additional commands that offer the possibility to switch to and from Hebrew language. These commands are backward compatible with the previous versions of hebrew.sty.

\sethebrew \unsethebrew The command \sethebrew will switch from the current font encoding to the hebrew font encoding, and from the current direction of text to the right-to-left mode. The command \unsethebrew switches back.

Both commands use standard right-to-left switching macros \setrllanguage{ r2l language name} and \unsetrllanguage{r2l language name}, that defined in the rlbabel.def file.

```
62.84 \def\sethebrew{\setrllanguage{hebrew}}
62.85 \def\unsethebrew{\unsetrllanguage{hebrew}}
```

\hebrewtext The following two commands are obsolete and work only in IATEX2.09 compatibil-\nohebrewtext ity mode. They are synonyms of \sethebrew and \unsethebrew defined above.

```
62.86 \if@compatibility
62.87 \let\hebrewtext=\sethebrew
62.88 \let\nohebrewtext=\unsethebrew
62.89 \fi
```

\tohebrew

These two commands change only the current font encoding to- and from- Hebrew encoding. Their implementation uses \@torl{language name} and \@fromrl macros defined in rlbabel.def file. Both commands may be useful only for package and class writers, not for regular users.

```
62.90 \ensuremath{\mbox{$0$}} \ensuremath{\mbox{$0$}
```

\@hebrew

Sometimes we need to preserve Hebrew mode without knowing in which environment we are located now. For these cases, the \@hebrew{hebrew text} macro will be useful. Not that this macro is similar to the \@number and \@latin macros defined in rlbabel.def file.

```
62.92 \def\@@hebrew#1{\beginR{{\tohebrew#1}}\endR}
62.93 \def\@hebrew{\protect\@@hebrew}
```

### 62.3.1 Hebrew numerals

We provide commands to print numbers in the traditional notation using Hebrew letters. We need commands that print a Hebrew number from a decimal input, as well as commands to print the value of a counter as a Hebrew number.

\if@gim@apost \if@gim@final Hebrew numbers can be written in various styles: with or without apostrophes, and with the letters kaf, mem, nun, pe, tsadi as either final or initial forms when they are the last letters in the sequence. We provide two flags to set the style options.

```
62.94 \newif\if@gim@apost % whether we print apostrophes 62.95 \newif\if@gim@final % whether we use final or initial letters
```

\hebrewnumeral \Hebrewnumeral \Hebrewnumeralfinal The commands that print a Hebrew number must specify the style locally: relying on a global style option could cause a counter to print in an inconsistent manner—for instance, page numbers might appear in different styles if the global style option changed mid-way through a document. The commands only allow three of the four possible flag combinations (I do not know of a use that requires the combination of final letters and no apostrophes –RA).

Each command sets the style flags and calls \@hebrew@numeral. Double braces are used in order to protect the values of \@tempcnta and \@tempcntb, which are changed by this call; they also keep the flag assignments local (this is not important because the global values are never used).

\alph Counter-printing commands are based on the above commands. The natural name \@alph for the counter-printing commands is \alph, because Hebrew numerals are the only way to represent numbers with Hebrew letters (kaf always means 20, never 11). \@alph

\Alphfinal \@Alphfinal

Hebrew has no uppercase letters, hence no need for the familiar meaning of \Alph; we therefore define \alph to print counters as Hebrew numerals without apostrophes, and \Alph to print with apostrophes. A third form, \Alphfinal, is provided to print with apostrophes and final letters, as is required for Hebrew year designators. The commands \alph and \Alph are defined in latex.ltx, and we only need to redefine the internal commands \@alph and \@Alph; for \Alphfinal we need to provide both a wrapper and an internal command. The counter printing commands are made semi-robust: without the \protect, commands like \theenumii break (I'm not quite clear on why this happens, -RA); at the same time, we cannot make the commands too robust (e.g. with \DeclareRobustCommand) because this would enter the command name rather than its value into files like .aux, .toc etc. The old meanings of meaning of \@alph and \@Alph are saved upon entering Hebrew mode and restored upon exiting it.

```
62.102 \addto\extrashebrew{%}
       \let\saved@alph=\@alph%
62.103
       \let\saved@Alph=\@Alph%
62.104
       \renewcommand*{\@alph}[1]{\protect\hebrewnumeral{\number#1}}%
62.105
62.106
       \renewcommand*{\@Alph}[1]{\protect\Hebrewnumeral{\number#1}}%
       \def\Alphfinal#1{\expandafter\@Alphfinal\csname c@#1\endcsname}%
62.107
       \providecommand*{\@Alphfinal}[1]{\protect\Hebrewnumeralfinal{\number#1}}}
62.109 \addto\noextrashebrew{%
       \let\@alph=\saved@alph%
62.110
62.111
       \let\@Alph=\saved@Alph}
```

Note that \alph (without apostrophes) is already the appropriate choice for the second-level enumerate label, and \Alph (with apostrophes) is an appropriate choice for appendix; however, the default LATEX labels need to be redefined for appropriate cross-referencing, see below. LATEX default class files specify \Alph for the fourth-level enumerate level, this should probably be changed. Also, the way labels get flushed left by default looks inappropriate for Hebrew numerals, so we should redefine \labelenumii as well as \labelenumiv (presently not implemented).

\theenumii \theenumiv Cross-references to counter labels need to be printed according to the language environment in which a label was issued, not the environment in which it is called: for example, a label (1b) issued in a Latin environment should be referred to as (1b) in a Hebrew text, and label (2dalet) issued in a Hebrew environment should be referred to as (2dalet) in a Latin text. This was the unanimous opinion in a poll sent to the IvriTeX list. We therefore redefine \theenumii and \theenumiv, so that an explicit language instruction gets written to the .aux file.

```
 62.112 \ensurement \https://document.com/results/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/files/fi
```

We also need to control for the font and direction in which a counter label is printed. Direction is straightforward: a Latin label like (1b) should be written left-to-right when called in a Hebrew text, and a Hebrew label like (2dalet) should be written right-to-left when called in a Latin text. The font question is more delicate, because we should decide whether the numerals should be typeset in

the font of the language environment in which the label was issued, or that of the environment in which it is called.

- A purely numeric label like (23) looks best if it is set in the font of the surrounding language.
- But a mixed alphanumeric label like (1b) lookes weird if the '1' is taken from the Hebrew font; likewise, (2dalet) looks weird if the '2' is taken from a Latin font.
- Finally, mixing the two possibilities is worst, because a single Hebrew sentence referring to examples (1b) and (2) would take the '1' from the Latin font and the '2' from the Hebrew font, and this looks really awful. (It is also very hard to implement).

In light of the conflicting considerations it seems like there's no perfect solution. I have chosen to implement the top option, where numerals are taken from the font of the surrounding language, because it seems to me that reference to purely numeric labels is the most common, so this gives a good solution to the majority of cases and a mediocre solution to the minority.

We redefine the \label command which writes to the .aux file. Depending on the language environment we issue appropriate \beginR/L···\endR/L commands to control the direction without affecting the font. Since these commands do not affect the value of \if@rl, we cannot use the macro \@brackets to determine the correct brackets to be used with \p@enumiii; instead, we let the language environment determine an explicit definition.

```
62.118 \def \label #1{\Qbsphack}
     \if@rl
62.119
62.120
      \def\p@enumiii{\p@enumii)\theenumii(}%
62.121
       \protected@write\@auxout{}%
          62.122
62.123
     \else
62.124
      \def\p@enumiii{\p@enumii(\theenumii)}%
       \protected@write\@auxout{}%
62.125
          62.126
62.127
     \fi
62.128
     \@esphack}
```

NOTE: it appears that the definition of \label is language-independent and thus belongs in rlbabel.def, but this is not the case. The decision to typeset label numerals in the font of the surrounding language is reasonable for Hebrew, because mixed-font (1b) and (2dalet) are somewhat acceptable. The same may not be acceptable for Arabic, whose numeral glyphs are radically different from those in the Latin fonts. The decision about the direction may also be different for Arabic, which is more right-to-left oriented than Hebrew (two examples: dates like 15/6/2003 are written left-to-right in Hebrew but right-to-left in Arabic; equations like 1+2=3 are written left-to-right in Hebrew but right-to-left in Arabic elementary school textbooks using Arabic numeral glyphs). My personal hunch is that a label like (1b) in an Arabic text would be typeset left-to-right if the '1' is a Western glyph, but right-to-left if the '1' is an Arabic glyph. But this is just a guess, I'd have to ask Arab typesetters to find the correct answer.  $\neg RA$ .

\appendix The following code provides for the proper printing of appendix numbers in tables of contents. Section and chapter headings are normally bilingual: regardless of

one for the Hebrew table of contents and one for the Latin table of contents. It makes sense that the label should be a Latin letter in the Latin table of contents and a Hebrew letter in the Hebrew table of contents. The definition is similar to that of \theenumii and \theenumiv above, but additional \protect commands ensure that the entire condition is written the .aux file. The appendix number will therefore be typeset according to the environment in which it is used rather than issued: a Hebrew number (with apostrophes) in a Hebrew environment and a Latin capital letter in a Latin environment (the command \@@Alph is set in rlbabel.def to hold the default meaning of LATEX [latin] \@Alph, regardless of the mode in which it is issued). The net result is that the second appendix will be marked with 'B' in the Latin table of contents and with 'bet' in the Hebrew table of contents; the mark in the main text will depend on the language of the appendix itself.

```

```

QUESTION: is this also the appropriate way to refer to an appendix in the text, or should we retain the original label the same way we did with enumerate labels? ANOTHER QUESTION: are similar redefinitions needed for other counters that generate texts in bilingual lists like .lof/.fol and .lot/.tol? -RA.

\@hebrew@numeral

The command \@hebrew@numeral prints a Hebrew number. The groups of thousands, millions, billions are separated by apostrophes and typeset without apostrophes or final letters; the remainder (under 1000) is typeset conventionally, with the selected styles for apostrophes and final letters. The function calls on \gim@no@mil to typeset each three-digit block. The algorithm is recursive, but the maximum recursion depth is 4 because  $T_EX$  only allows numbers up to  $2^{31} - 1 = 2,147,483,647$ . The typesetting routine is wrapped in \@hebrew in order to ensure that numbers are always typeset in Hebrew mode.

Initialize: \Otempcnta holds the value, \Otempcntb is used for calculations.

```
62.141 \newcommand*{\@hebrew@numeral}[1]
62.142 {\@hebrew{\@tempcnta=#1\@tempcntb=#1\relax
62.143 \divide\@tempcntb by 1000

If we're under 1000, call \gim@nomil
62.144 \ifnum\@tempcntb=0\gim@nomil\@tempcnta\relax
```

If we're above 1000 then force no apostrophe and no final letter styles for the value above 1000, recur for the value above 1000, add an apostrophe, and call \gim@nomil for the remainder.

```
 62.145 $$ \else{\gim@apostfalse\gim@finalfalse\ghebrew@numeral\gtempcntb}', 62.146 $$ \multiply\gtempcntb by 1000\relax
```

```
62.147 \advance\@tempcnta by -\@tempcntb\relax
62.148 \gim@nomil\@tempcnta\relax
62.149 \fi
62.150 }}
```

NOTE: is it the case that 15,000 and 16,000 are written as yod-he and yod-vav, rather than tet-vav and tet-zayin? This vaguely rings a bell, but I'm not certain. If this is the case, then the current behavior is incorrect and should be changed.—BA.

\gim@nomil The command \gim@nomil typesets an integer between 0 and 999 (for 0 it typesets nothing). The code has been modified from the old hebcal.sty (appropriate credits—Boris Lavva and Michail Rozman?). \@tempcnta holds the total value that remains to be typeset. At each stage we find the highest valued letter that is less than or equal to \@tempcnta, and call on \gim@print to subtract this value and print the letter.

Initialize: \@tempcnta holds the value, there is no previous letter.

       \fi
62.191
62.192 }
```

\gim@print \if@gim@prev The actual printing routine typesets a digit with the appropriate apostrophes: if a number sequence consists of a single letter then it is followed by a single apostrophe, and if it consists of more than one letter then a double apostrophe is inserted before the last letter. We typeset the letters one at a time, keeping a flag that tells us if any previous letters had been typeset.

 $62.193 \newif\if\gim\prev \%$  flag if a previous letter has been typeset

For each letter, we first subtract its value from the total. Then,

- if the result is zero then this is the last letter; we check the flag to see if this is the only letter and print it with the appropriate apostrophe;
- if the result is not zero then there remain additional letters to be typeset; we print without an apostrophe and set the 'previous letter' flag.

\@tempcnta holds the total value that remains to be typeset. We first deduct the letter's value from \@tempcnta, so \@tempcnta is zero if and only if this is the last letter.

If this is the last letter, we print with the appropriate apostrophe (depending on the style option): if there is a preceding letter, print "x if the style calls for apostrophes, x if it doesn't; otherwise, this is the only letter: print x' if the style calls for apostrophes, x if it doesn't.

```
62.196 \ifnum\@tempcnta=0% if this is the last letter
62.197 \if@gim@prev\if@gim@apost"\fi#2%
62.198 \else#2\if@gim@apost'\fi\%
```

If this is not the last letter: print a non-final form (by forcing a local style option) and set the 'previous letter' flag.

```
62.199 \else{\@gim@finalfalse#2}\@gim@prevtrue\fi}
```

\hebr The older Hebrew counter commands \hebr and \gim are retained in order to \gim keep older documents from breaking. They are set to be equivalent to \alph, and their use is deprecated. Note that \hebr gives different results than it had in the past—it now typesets 11 as yod-alef rather than kaf.

```
62.200 \let\hebr=\alph
62.201 \let\gim=\alph
```

For backward compatibility with 'older' hebrew.sty packages, we define Hebrew equivalents of some useful LATEX commands. Note, however, that 8-bit macros defined in Hebrew are no longer supported.

```
 62.202 \end{are} $62.203 \end{are} $62.203 \end{are} $62.204 \end{are} $62.204 \end{are} $62.205 \end{are} $62.205 \end{are} $1.205 \end{ar
```

\hadgesh produce "poor man's bold" (heavy printout), when used with normal font glyphs. It is advisable to use bold font (for example, Dead Sea) instead of this macro.

\piska and \piskapiska sometimes used in 'older' hebrew sources, and should not be used in IATFX  $2_{\varepsilon}$ .

```
62.210 \if@compatibility
62.211 \def\piska#1{\item{#1}\hangindent=-\hangindent}
62.212 \def\piskapiska#1{\itemitem{#1}\hangindent=-\hangindent}
62.213 \fi
```

The following commands are simply synonyms for the standard ones, provided with LATEX  $2_{\varepsilon}$ .

```
62.214 \let\makafgadol=\textendash
62.215 \let\makafanak=\textendash
62.216 \let\geresh=\textquoteright
62.217 \let\opengeresh=\textquoteright
62.218 \let\closegeresh=\textquoteleft
62.219 \let\openquote=\textquotedblright
62.220 \let\closequote=\textquotedblright
62.221 \let\leftquotation=\textquotedblright
62.222 \let\rightquotation=\textquotedblright
```

We need to ensure that Hebrew is used as the default right-to-left language at \begin{document}. The mechanism of defining the \@rllanguagename is the same as in babel's \languagename: the last right-to-left language in the \usepackage{babel} line is set as the default right-to-left language at document beginning.

For example, the following code:

```
\usepackage[russian,hebrew,arabic,greek,english]{babel}
```

will set the Arabic language as the default right-to-left language and the English language as the default language. As a result, the commands \L{} and \embox{} will use English and \R{} and \hmbox{} will use Arabic by default. These defaults can be changed with the next \sethebrew or \selectlanguage \language \name \cdot command.

```
62.223 \AtBeginDocument{\def\@rllanguagename{hebrew}}
```

The macro \ldf@finish takes care of looking for a configuration file, setting the main language to be switched on at \begin{document} and resetting the category code of @ to its original value.

## 62.4 Right to left support

This file rlbabel.def defines necessary bidirectional macro support for  $\LaTeX$   $\mathbf{Z}_{\mathcal{E}}$ . It is designed for use not only with Hebrew, but with any Right-to-Left languages, supported by babel. The macros provided in this file are language and encoding independent.

Right-to-left languages will use  $T_EX$  extensions, namely  $T_EX$  primitives \beginL, \endL and \beginR, \endR, currently implemented only in  $\varepsilon$ - $T_EX$  and in  $T_EX$ - $X_ET$ .

If  $\varepsilon$ -T<sub>E</sub>X is used, we should switch it to the *enhanced* mode:

```
 62.226 \  \langle *rightleft \rangle \\  62.227 \  \langle ifx\TeXXeTstate\undefined\else\% \\  62.228 \  \  \TeXXeTstate=1 \\  62.229 \  \
```

Note, that  $\varepsilon$ -TEX's format file should be created for *extended* mode. Mode can be checked by running  $\varepsilon$ -TEX on some TEX file, for example:

```
This is e-TeX, Version 3.14159-1.1 (Web2c 7.0) entering extended mode
```

The second line should be entering extended mode.

We check if user uses Right-to-Left enabled engine instead of regular Knuth's  $T_{\rm F}X$ :

```
62.230 \ifx\beginL\@undefined%
62.231 \newlinechar'\^^J
62.232 \typeout{^^JTo avoid this error message,^^J%
62.233 run TeX--XeT or e-TeX engine instead of regular TeX.^^J}
62.234 \errmessage{Right-to-Left Support Error: use TeX--XeT or e-TeX
62.235 engine}%
62.236 \fi
```

## 62.4.1 Switching from LR to RL mode and back

\@torl and \@fromrl are called each time the horizontal direction changes. They do all that is necessary besides changing the direction. Currently their task is to change the encoding information and mode (condition \if@rl). They should not normally be called by users: user-level macros, such as \sethebrew and \unsethebrew, as well as babel's \selectlanguage are defined in language-definition files and should be used to change default language (and direction).

Local direction changing commands (for small pieces of text): \L{}, \R{}, \embox{} and \hmbox{} are defined below in this file in language-independent manner.

\if@rl rltrue means that the main mode is currently Right-to-Left.
rlfalse means that the main mode is currently Left-to-Right.
62.237 \newif\if@rl

\if@rlmain This is the main direction of the document. Unlike \if@rl it is set once and never changes.

rltrue means that the document is Right-to-Left. rlfalse means that the document is Left-to-Right.

Practically \if@rlmain is set according to the value of \if@rl in the beginning of the run.

```
62.238 \AtBeginDocument{% Here we set the main document direction
62.239 \newif\if@rlmain%
62.240 \if@rl% e.g: if the options to babel were [english,hebrew]
62.241 \@rlmaintrue%
62.242 \else% e.g: if the options to babel were [hebrew,english]
62.243 \@rlmainfalse%
62.244 \fi%
62.245}
```

\Otorl Switches current direction to Right-to-Left: saves current Left-to-Right encoding in \lr@encodingdefault, sets required Right-to-Left language name in \Orllanguagename (similar to babel's \languagename) and changes derection.

The Right-to-Left language encoding should be defined in .1df file as special macro created by concatenation of the language name and string encoding, for example, for Hebrew it will be \hebrewencoding.

```
62.246 \DeclareRobustCommand{\Qtorl}[1]{\%}
62.247
       \if@rl\else%
           \let\lr@encodingdefault=\encodingdefault%
62.248
        \fi%
62.249
        \def\@rllanguagename{#1}%

       \fontencoding{\encodingdefault}%
62.253
        \selectfont%
       \@rltrue}
62.254
```

\Officerrow Opposite to \Otorl, switches current direction to Left-to-Right: restores saved Left-to-Right encoding (\lrectioncodingdefault) and changes direction.

```
62.255 \DeclareRobustCommand{\@fromrl}{%
62.256 \if@rl%
62.257 \let\encodingdefault=\lr@encodingdefault%
62.258 \fi%
62.259 \fontencoding{\encodingdefault}%
62.260 \selectfont%
62.261 \@rlfalse}
```

\selectlanguage This standard babel's macro should be redefined to support bidirectional tables.

We divide \selectlanguage implementation to two parts, and the first part calls the second \@@selectlanguage.

```
      62.262 \exp \text{andafter} \left( \frac{1}{\%} \right) $$ \left( \frac{1}{\%}
```

\@@selectlanguage

This new internal macro redefines a final part of the standard babel's \selectlanguage implementation.

Standard LaTeX provides us with 3 tables: Table of Contents (.toc), List of Figures (.lof), and List of Tables (.lot). In multi-lingual texts mixing Left-to-Right languages with Right-to-Left ones, the use of various directions in one table results in very ugly output. Therefore, these 3 standard tables will be used now

only for Left-to-Right languages, and we will add 3 Right-to-Left tables (their extensions are simply reversed ones): RL Table of Contents (.cot), RL List of Figures (.fol), and RL List of Tables (.lof).

```

62.292
```

\L Macros for changing direction, originally taken from TUGboat. Usage: \L{Left to \R Right text} and \R{Right to Left text}. Numbers should also be enclosed in \L{}, \HeblatexRedefineL as in \L{123}.

Note, that these macros do not receive language name as parameter. Instead, the saved \@rllanguagename will be used. We assume that each Right-to-Left language defines \tolanguagename and \fromlanguagename macros in language definition file, for example, for Hebrew: \tohebrew and \fromhebrew macros in hebrew.ldf file.

The macros \L and \R include 'protect' to to make them robust and allow use, for example, in tables.

Due to the fact that some packages have different definitions for \L the macro \HeblatexRedefineL is provided to overide them. This may be required with hyperref, for instance.

```
62 293 \let\next=\
          62.294 \def\HeblatexRedefineL{%
                  62.295

          62.306 \errmessage{Missing left brace has been substituted}\fi \bgroup}
          62.307 \everydisplay{\if@rl\aftergroup\beginR\fi }
\@ensure@R Two small internal macros, a-la \ensuremath
\label{lem:consure} $$ \operatorname{QensureQR}_{2.308} \left( \operatorname{CensureQR}_{1} \right) = R_{1} \right) $$
          62.309 \def\@ensure@L#1{\if@rl\L{#1}\else#1\fi}
```

Take care of Right-to-Left indentation in every paragraph. Originally, \noindent was redefined for right-to-left by Yaniv Bargury, then the implementation was rewritten by Alon Ziv using an idea by Chris Rowley: \noindent now works unmodified.

\hmbox Useful vbox commands. All text in math formulas is best enclosed in these: LR \embox text in \embox and RL text in \hmbox. \mbox{} is useless for both cases, since it typesets in Left-to-Right even for Right-to-Left languages (additions by Yaniv Bargury).

\\Omega brackets \\Omega brackets should be swapped. This macro receives 3 parameters: left bracket, content, right bracket. Brackets can be square brackets, braces, or parentheses.

\Cnumber \Cnumber preserves numbers direction from Left to Right. \Clatin in addition \Clatin switches current encoding to the latin.

### 62.4.2 Counters

To make counter references work in Right to Left text, we need to surround their original definitions with an \@number{...} or \@latin{...}. Note, that language-specific counters, such as \hebr or \gim are provided with language definition file.

```
We start with saving the original definitions:
                                    62.321 \ \text{let}\ \text{@arabic} = \text{@arabic}
                                    62.322 \ \text{let}\ \text{@@roman} = \text{@roman}
                                    62.323 \let\@@Roman=\@Roman
                                    62.324 \left( \ensuremath{\texttt{QQalph}} = \ensuremath{\texttt{Qalph}} \right)
                                    62.325 \left( Alph = \Alph \right)
           \@arabic Arabic and roman numbers should be from Left to Right. In addition, roman
              \Croman numerals, both lower- and upper-case should be in latin encoding.
              \ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ensuremath{\ens

### 62.4.4 List environments

List environments in Right-to-Left languages, are ticked and indented from the right instead of from the left. All the definitions that caused indentation are revised for Right-to-Left languages. LATEX keeps track on the indentation with the \leftmargin and \rightmargin values.

list Thus we need to override the definition of the \list macro: when in RTL mode, the right margins are the beginning of the line.

```
62.353 \def \list#1#2{%}
       62.354
         \@toodeep
62.355
       \else
62.356
62.357
          \global\advance\@listdepth\@ne
62.358
       \rightmargin\z@
62.359
62.360
       \listparindent\z0
62.361
       \itemindent\z@
62.362
       \csname @list\romannumeral\the\@listdepth\endcsname
62.363
       \def\@itemlabel{#1}%
       \let\makelabel\@mklab
62.364
       \@nmbrlistfalse
62.365
       #2\relax
62.366
       \@trivlist
62.367
       \parskip\parsep
62.368
       \parindent\listparindent
62.369
       \advance\linewidth -\rightmargin
62.370
62.371
       \advance\linewidth -\leftmargin
   The only change in the macro is the \if@rl case:
62.372
62.373
         \advance\@totalleftmargin \rightmargin
62.374
       \else
62.375

62.376
       \fi
       \parshape \@ne \@totalleftmargin \linewidth
62.377
       \ignorespaces}
62.378
```

\labelenumii The \labelenumii and \p@enumiii commands use parentheses. They are revised \p@enumiii to work Right-to-Left with the help of \@brackets macro defined above.

```
62.379 \def\labelenumii{\@brackets(\theenumii)}
62.380 \def\p@enumiii{\p@enumii\@brackets(\theenumii)}
```

# 62.4.5 Tables of moving stuff

Tables of moving arguments: table of contents (toc), list of figures (lof) and list of tables (lot) are handles here. These three default LaTeX tables will be used now exclusively for Left to Right stuff.

Three additional Right-to-Left tables: RL table of contents (cot), RL list of figures (fol), and RL list of tables (tol) are added. These three tables will be used exclusively for Right to Left stuff.

\Color tents We define 3 new macros similar to the standard LATEX tables, but with one parameter — table file extension. These macros will help us to define our additional tables below.

## 62.4.6 Two-column mode

This is the support of twocolumn option for the standard LATEX  $2_{\mathcal{E}}$  classes. The following code was originally borrowed from the ArabTeX package, file latexext.sty, copyright by Klaus Lagally, Institut fuer Informatik, Universitaet Stuttgart. It was updated for this package by Boris Lavva.

```
\@outputdblcol
\set@outputdblcol
rl@outputdblcol
```

First column is \@leftcolumn will be shown at the right side, Second column is \@outputbox will be shown at the left side.

\set@outputdblcol IS CURRENTLY DISABLED. TODO: REMOVE IT [tzafrir]

```

```

# 62.4.8 Headings and two-side support

When using headings or myheadings modes, we have to ensure that the language and direction of heading is the same as the whole chapter/part of the document. This is implementing by setting special variable \headlanguage when starting new chapter/part.

In addition, when selecting the twoside option (default in book document class), the LR and RL modes need to be set properly for things on the heading and footing. This is done here too.

```
ps@headings First, we will support the standard letter class:
ps@myheadings_{2.637} \end{classloaded{letter}{%}}

## 62.4.9 Postscript Porblems

Any command that is implemented by PostScript directives, e.g commands from the ps-tricks package, needs to be fixed, because the PostScript directives are being interpeted after the document has been converted by TEXto visual Hebrew (DVI, PostScript and PDF have visual Hebrew).

```
For instance: Suppose you wrote in your document:
\textcolor{cyan}{some ltr text}
This would be interpeted by TEXto something like:
[postscript:make color cyan]some LTR text[postscript:make color black]
However, with the bidirectionality support we get:
\textcolor{cyan}{\hebbet}
```

Translated to:

[postscript:make color black]{bet}{alef}[postscript:make color cyan] While we want:

[postscript:make color cyan]{bet}{alef}[postscript:make color black] The following code will probably work at least with code that stays in the same line:

#### @textcolor

```
62.782 \AtBeginDocument{%
       %I assume that \Otextcolor is only defined by the package color
       \ifx\@textcolor\@undefined\else%
62.785
         \% If that macro was defined before the beginning of the document,
         \% that is: the package was loaded: redefine it with bidi support

## 62.4.10 Miscellaneous internal L⁴TEX macros

\raggedright \raggedright was changed from latex.ltx file to support Right-to-Left mode, \raggedleft because of the bug in its implementation.

```
62.805 \def\raggedright{%
62.806 \let\\\@centercr
62.807 \leftskip\z@skip\rightskip\@flushglue
62.808 \parindent\z@\parfillskip\z@skip}
```

Swap meanings of \raggedright and \raggedleft in Right-to-Left mode.

```
62.809 \let\@@raggedleft=\raggedleft
62.810 \let\@@raggedright=\raggedright
62.811 \renewcommand\raggedleft{\if@rl\@@raggedright%
62.812 \else\@@raggedleft\fi}
62.813 \renewcommand\raggedright{\if@rl\@@raggedleft%
62.814 \else\@@raggedright\fi}
```

\author \author is inserted with tabular environment, and will be used in restricted horizontal mode. Therefore we have to add explicit direction change command when in Right-to-Left mode.

\MakeUppercase There are no uppercase and lowercase letters in most Right-to-Left languages, therefore we should redefine \MakeUppercase and \MakeLowercase  $\LaTeX$  commands.

```
62.817 \label{lem:case-MakeUppercase} \\ 62.818 \def\MakeUppercase#1{\if@rl#1\else\@@MakeUppercase{#1}\fi} \\ 62.819 \let\@@MakeLowercase=\MakeLowercase \\ 62.820 \def\MakeLowercase#1{\if@rl#1\else\@@MakeLowercase{#1}\fi} \\ \\
```

\underline We should explicitly use \L and \R commands in \underlined text.

```
62.821 \let\@@@underline=\underline
62.822 \def\underline#1{\@@@underline{\if@rl\R{#1}\else #1\fi}}
```

\undertext was added for LATEX2.09 compatibility mode.

```
62.823 \if@compatibility
62.824 \let\undertext=\underline
62.825 \fi
```

\@xnthm The following has been inserted to correct the appearance of the number in \newtheorem to reorder theorem number components. A similar correction in the definition of \@opargbegintheorem was added too.

```
62.826 \def\@xnthm#1#2[#3]{%
                                      \expandafter\@ifdefinable\csname #1\endcsname

                                                                                 \endlist}}}
```

\@verbatim All kinds of verbs (\verb,\verb\*,verbatim and verbatim\*) now can be used in Right-to-Left mode. Errors in latin mode solved too.

```
62.946 \def\@verbatim{%
62.947 \let\do\@makeother \dospecials%
62.948 \obeylines \verbatim@font \@noligs}
```

\Captions are set always centered. This allows us to use bilingual captions, for example: \caption{\R{RLtext}}, which will be formatted as:

Right to left caption here (RLtext) Left to right caption here (LRtext)

See also \bcaption command below.

```
62.949 \long\def\@makecaption#1#2{%
62.950 \vskip\abovecaptionskip%
62.951 \begin{center}%
62.952 #1: #2%
62.953 \end{center} \par%
62.954 \vskip\belowcaptionskip}
```

#### 62.4.12 Additional bidirectional commands

- Section headings are typeset with the default global direction.
- Text in section headings in the reverse language do not have to be protected for the reflection command, as in: \protect\L{Latin Text}, because \L and \R are robust now.
- Table of contents, list of figures and list of tables should be typeset with the \tableofcontents, \listoffigures and \listoftables commands respectively.
- The above tables will be typeset in the main direction (and language) in effect where the above commands are placed.
- Only 2 tables of each kind are supported: one for Right-to-Left and another for Left-to-Right directions.

How to include line to both tables? One has to use bidirectional sectioning commands as following:

- 1. Use the \bxxx version of the sectioning commands in the text instead of the \xxx version (xxx is one of: part, chapter, section, subsection, subsubsection, caption).
- 2. Syntax of the bxxx command is  $bxxx{RL text}{LR text}$ . Both arguments are typeset in proper direction by default (no need to change direction for the text inside).
- 3. The section header inside the document will be typeset in the global direction in effect at the time. i.e. The {RL text} will be typeset if Right-to-Left mode is in effect and {LR text} otherwise.

# 62.5 Hebrew calendar

The original version of the package hebcal.sty<sup>75</sup> for T<sub>E</sub>X and L<sup>A</sup>T<sub>E</sub>X2.09, entitled "T<sub>E</sub>X & L<sup>A</sup>T<sub>E</sub>X macros for computing Hebrew date from Gregorian one" was created by Michail Rozman, misha@iop.tartu.ew.su<sup>76</sup>

<sup>&</sup>lt;sup>75</sup>The following description of hebcal package is based on the comments included with original source by the author, Michail Rozman.

 $<sup>^{76}</sup>$ Please direct any comments, bug reports, questions, etc. about the package to this address.

Released: Tammuz 12, 5751–June 24, 1991

Corrected: Shebat 10, 5752—January 15, 1992 by Rama Porrat Corrected: Adar II 5, 5752—March 10, 1992 by Misha

Corrected: Tebeth, 5756–January 1996 Dan Haran

(haran@math.tau.ac.il)

The package was adjusted for babel and  $\mathbb{E} T_{E\!X} 2_{\mathcal{E}}$  by Boris Lavva.

Changes to the printing routine (only) by Ron Artstein, June 1, 2003.

This package should be included after the babel with hebrew option, as following:

```
\documentclass[...]{...}
\usepackage[hebrew,...,other languages,...]{babel}
\usepackage{hebcal}
```

Two main user-level commands are provided by this package:

\Hebrewtoday

Computes today's Hebrew date and prints it. If we are presently in Hebrew mode, the date will be printed in Hebrew, otherwise — in English (like Shebat 10, 5752).

\Hebrewdate

Computes the Hebrew date from the given Gregorian date and prints it. If we are presently in Hebrew mode, the date will be printed in Hebrew, otherwise — in English (like Shebat 10, 5752). An example of usage is shown below:

```
\newcount\hd \newcount\hm \newcount\hy
\hd=10 \hm=3 \hy=1992
\Hebrewdate{\hd}{\hm}{\hy}
```

The package option full sets the flag \@full@hebrew@year, which causes years from the current millenium to be printed with the thousands digit (hetav-shin-samekh-gimel). Without this option, thousands are not printed for the current millenium. NOTE: should this be a command option rather than a package option? -RA.

# 62.5.1 Introduction

The Hebrew calendar is inherently complicated: it is lunisolar – each year starts close to the autumn equinox, but each month must strictly start at a new moon. Thus Hebrew calendar must be harmonized simultaneously with both lunar and solar events. In addition, for reasons of the religious practice, the year cannot start on Sunday, Wednesday or Friday.

For the full description of Hebrew calendar and for the list of references see:

Nachum Dershowitz and Edward M. Reingold, "Calendarical Calculations", Software–Pract.Exper., vol. 20 (9), pp.899–928 (September 1990).

C translation of LISP programs from the above article available from Mr. Wayne Geiser, geiser%pictel@uunet.uu.net.

The 4<sup>th</sup> distribution (July 1989) of hdate/hcal (Hebrew calendar programs similar to UNIX date/cal) by Mr. Amos Shapir, amos@shum.huji.ac.il, contains short and very clear description of algorithms.

## 62.5.2 Registers, Commands, Formatting Macros

The command \Hebrewtoday produces today's date for Hebrew calendar. It is similar to the standard  $\LaTeX$  2 $\varepsilon$  command \today. In addition three numerical registers \Hebrewday, \Hebrewmonth and \Hebrewgear are set. For setting this registers without producing of date string command \Hebrewsetreg can be used.

The command  $\ensuremath{\mbox{\mbox{Hebrewdate}}\{Gday\}\{Gmonth\}\{Gyear\}\ }$  produces Hebrew calendar date corresponding to Gregorian date Gday.Gmonth.Gyear. Three numerical registers  $\ensuremath{\mbox{\m$ 

For converting arbitrary Gregorian date Gday.Gmonth.Gyear to Hebrew date Hday.Hmonth.Hyear without producing date string the command:

 $\HebrewFromGregorian\{Gday\}\{Gmonth\}\{Gyear\}\{Hday\}\{Hmonth\}\{Hyear\}\}$ 

```
can be used.

```

To prepare another language version of Hebrew calendar commands, one should change or add commands here.

We start with Hebrew language macros.

\HebrewYearName Prints Hebrew year as a Hebrew number. Disambiguates strings by adding lamed-pe-gimel to years of the first Jewish millenium and to years divisible by 1000. Suppresses the thousands digit in the current millenium unless the package option full is selected. NOTE: should this be provided as a command option rather than a package option? -RA.

```
62.1004 \def\HebrewYearName#1{{%

# 63 Hebrew input encodings

Hebrew input encodings defined in file hebinp.dtx<sup>77</sup> should be used with inputenc  $\LaTeX$  2 $\varepsilon$  package. This package allows the user to specify an input encoding from this file (for example, ISO Hebrew/Latin 8859-8, IBM Hebrew codepage 862 or MS Windows Hebrew codepage 1255) by saying:

```
\usepackage[encoding name] {inputenc}
```

The encoding can also be selected in the document with:

```
\inputencoding{encoding name}
```

The only practical use of this command within a document is when using text from several documents to build up a composite work such as a volume of journal articles. Therefore this command will be used only in vertical mode.

The encodings provided by this package are:

- si960 7-bit Hebrew encoding for the range 32–127. This encoding also known as "old-code" and defined by Israeli Standard SI-960.
- 8859-8 ISO 8859-8 Hebrew/Latin encoding commonly used in UNIX systems. This encoding also known as "new-code" and includes hebrew letters in positions starting from 224.
- cp862 IBM 862 code page commonly used by DOS on IBM-compatible personal computers. This encoding also known as "pc-code" and includes hebrew letters in positions starting from 128.
- cp1255 MS Windows 1255 (hebrew) code page which is similar to 8859-8. In addition to hebrew letters, this encoding contains also hebrew vowels and dots (nikud).

Each encoding has an associated .def file, for example 8859-8.def which defines the behaviour of each input character, using the commands:

This defines the input character *slot* to be the *text* material or *math* material respectively. For example, 8859-8.def defines slots "EA (letter hebalef) and "B5  $(\mu)$  by saying:

```
\DeclareInputText{224}{\hebalef}
\DeclareInputMath{181}{\mu}
```

Note that the *commands* should be robust, and should not be dependent on the output encoding. The same *slot* should not have both a text and a math declaration for it. (This restriction may be removed in future releases of inputenc).

The .def file may also define commands using the declarations:

 $\verb|\providecommand| or \verb|\ProvideTextCommandDefault|. For example, 8859-8.def defines:$ 

 $<sup>^{77}</sup>$ The files described in this section have version number v1.1b and were last revised on 2004/02/20.

The use of the 'provide' forms here will ensure that a better definition will not be over-written; their use is recommended since, in general, the best defintion depends on the fonts available.

See the documentation in inputenc.dtx for details of how to declare input definitions for various encodings.

#### 63.1 Default definitions for characters

First, we insert a \makeatletter at the beginning of all .def files to use @ symbol in the macros' names.

```
63.1 \langle -driver \rangle \setminus makeatletter
```

 $63.29 \ \langle /8859 - 8 \rangle$ 

Some input characters map to internal functions which are not in either the T1 or OT1 font encoding. For this reason default definitions are provided in the encoding file: these will be used unless some other output encoding is used which supports those glyphs. In some cases this default defintion has to be simply an error message.

Note that this works reasonably well only because the encoding files for both OT1 and T1 are loaded in the standard LaTeX format.

The name \textblacksquare is derived from the AMS symbol name since Adobe seem not to want this symbol. The default definition, as a rule, makes no claim to being a good design.

```
63.16 (*cp862)
63.17 \ProvideTextCommandDefault{\textblacksquare}
        {\vrule \@width .3em \@height .4em \@depth -.1em\relax}
63.19 (/cp862)
      Some commands can't be faked, so we have them generate an error message.
63.20 \ \langle *8859 - 8 \ | \ cp862 \ | \ cp1255 \rangle
63.21 \ProvideTextCommandDefault{\textcent}
        {\TextSymbolUnavailable\textcent}
63.23 \ProvideTextCommandDefault{\textyen}
63.24
        {\TextSymbolUnavailable\textyen}
63.25 \langle /8859 - 8 \mid cp862 \mid cp1255 \rangle
63.26 \ \langle *8859 - 8 \rangle
63.27 \ProvideTextCommandDefault{\textcurrency}
        {\TextSymbolUnavailable\textcurrency}
63.28
```

```
 \begin{array}{lll} 63.30 & \langle & cp1255 \rangle \\ 63.31 & ProvideTextCommandDefault\{\newsheqel\} \\ 63.32 & \{ \TextSymbolUnavailable\newsheqel\} \\ 63.33 & \langle \cp1255 \rangle \\ 63.34 & \langle & 8859 - 8 \mid cp1255 \rangle \\ 63.35 & ProvideTextCommandDefault\{\textbrokenbar\} \\ 63.36 & \{ \TextSymbolUnavailable\textbrokenbar\} \\ 63.37 & \langle \cp1255 \rangle \\ 63.38 & \langle & cp1255 \rangle \\ 63.39 & ProvideTextCommandDefault\{\textperthousand\} \\ 63.40 & \{ \TextSymbolUnavailable\textperthousand\} \\ 63.41 & \langle \cp1255 \rangle \\ \end{array}
```

Characters that are supposed to be used only in math will be defined by  $\providecommand$  because  $\providecommand$  because  $\providecommand$  assumes that the font encoding for math fonts is static.

# 63.2 The SI-960 encoding

The SI-960 or "old-code" encoding only allows characters in the range 32–127, so we only need to provide an empty si960.def file.

# 63.3 The ISO 8859-8 encoding and the MS Windows cp1255 encoding

The 8859-8.def encoding file defines the characters in the ISO 8859-8 encoding. The MS Windows Hebrew character set incorporates the Hebrew letter repertoire of ISO 8859-8, and uses the same code points (starting from 224). It has also some important additions in the 128–159 and 190–224 ranges.

Finally, we reset the category code of the @ sign at the end of all .def files. 63.269 (-driver)\makeatother

# 64 Hebrew font encodings

Don't forget to update the docs...

# 64.1 THIS SECTION IS OUT OF DATE. UPDATE DOCS TO MATCH HE8 ENCODING

The file hebrew.fdd<sup>78</sup> contains the Local Hebrew Encoding (LHE) definition, the external font information needed to use the Hebrew 7-bit fonts (old code fonts) and hebfont package that provides Hebrew font switching commands.

Using this file as an input, lheenc.def encoding definition file, all .fd files (font definition files) and font switching package for available Hebrew fonts are generated. We chose to use 7-bit encoding as default font encoding, because:

- 1. There are many 7-bit encoded Hebrew fonts available, more then for any other encoding.
- 2. Available T<sub>E</sub>X Hebrew fonts do not include latin alphabet, and we can safely map Hebrew glyphs to the ASCII positions (0-127).

Current definition of the LHE encoding supports only Hebrew letters (\heblaef-\hebtav), but not Hebrew points, such as \hebdagesh, \hebqamats, \hebpatah, \hebshindot, etc. We are working now on such addition.

# 64.2 The DOCSTRIP modules

The following modules are used in the implementation to direct DOCSTRIP in generating external files:

 $<sup>^{-78}</sup>$ The files described in this section have version number v1.2c and were last revised on 2005/05/20.

driver produce a documentation driver file

HE8enc produce the encoding definition for CodePage 1255 (HE8)

HE8cmr make Hebrew default font in HE8
HE8cmss make Hebrew sans-serif font in HE8
HE8cmtt make Hebrew typewriter font in HE8

HE8OmegaHebrew Hebrew font from the Omega project (by ???)

HE8aharoni Hebrew sans-serif font (Culmus)
HE8david Hebrew serif font (Culmus)
HE8drugulin Hebrew old serif font (Culmus)
HE8ellinia Hebrew isans-serif font (Culmus)
HE8frankruehl Hebrew serif font (Culmus)

HE8KtavYad Hebrew handwriting font (Culmus)

HE8MiriamMono Hebrew monospaced font

HE8Nachlieli Hebrew sans-serif font (Culmus)

HE8CourierShalom Hebrew Shalom (Courier) font (by IBM)
HE8HelveticaNarkissTam Hebrew NarkisTam (Helvetica) (by Zvi Narkis)
HE8TimesNarkissim Hebrew Narkissim (Times) (by Zvi Narkis)

HE8mfdavid Hebrew David font (by ???)

HE8mffrank Hebrew Frank-Ruehl font (by ??)

HE8mffrankthick Hebrew Frank-Ruehl (thick) font (by ??)

HE8mffrankthin Hebrew Frank-Ruehl (thin) font (by ??)

HE8mfmiriam Hebrew Miriam font (by ???)

HE8mfmiriamwide Hebrew Miriam (wide) font (by ???)
HE8mfnarkistam Hebrew Narkis Tam font (by ???)

LHEenc produce the encoding definition for Local Hebrew Encoding (LHE)

LHEcmr make Hebrew default font in LHE

LHEcmss make Hebrew sans-serif font in LHE

LHEcmtt make Hebrew typewriter font in LHE

LHEclas make Hebrew classic font (by Joel M. Hoffman) in LHE

LHEshold make Hebrew shalom old font (by Jonathan Brecher) in LHE

LHEshscr make Hebrew shalom script font (by Jonathan Brecher) in LHE

LHEshstk make Hebrew shalom stick font (by Jonathan Brecher) in LHE

LHEfr make Hebrew frank-ruehl font in LHE

LHEcrml make Hebrew carmel font (by Dr. Samy Zafrany) in LHE LHEredis make Hebrew redis font (by Prof. Jacques J. Goldberg) in LHE

nowarn option for font definition files, that used

to produce "silent" font substitutions without giving warnings

hebfont create Hebrew font switching commands package

A typical DOCSTRIP command file would then have entries like:

 $\label{lem:dd} $$ \operatorname{lhecmr.fd}_{t}^{\operatorname{lhecmr.fd}}_{t}\operatorname{hebrew.fdd}_{LHEcmr,nowarn}$$$ 

# 64.3 The LHE encoding definition file

The Hebrew font encoding LHE is based upon the old-code encoding also known as the Israeli Standard SI-960. Many Hebrew TEX fonts from the Hebrew University of Jerusalem are encoded in this encoding. It only uses the lower 128 positions of the font table. As local encoding its name start with the letter 'L'.

First we define the Local Hebrew Encoding; specify a default for the font substitution process for the LHE encoding and supply a font to be used when all else fails.

Because not everyone can input Hebrew input text directly from the keyboard we need to define control sequences for all the Hebrew glyphs in the fonts. In addition, we want to support many input encodings for Hebrew and to keep the language definition file (hebrew.ldf) independent of the encoding. Therefore, we exploit the standard LaTeX  $2_{\varepsilon}$  font encoding mechanism to define control sequences for all the Hebrew glyphs in the fonts in encoding-specific way. The language definition file uses only the control sequences and doesn't need to check the current font or input encoding.

In the LHE encoding (7-bit encoding) all the Hebrew glyphes reside in the *lower* half of the font. Currently, only the Hebrew letters are supported. They use the same positions as the latin small letters in ASCII encoding and the position of '.

The symbol '(glyph 96) is used by Hebrew letter Alef, so we need to define its lccode to allow hyphenation. All other letters retain the same lccodes as their latin counterparts.

```
_{64.12} \langle +LHEenc \rangle \setminus 1ccode ``=``
  Hebrew letters occupy the positions 96-122 in LHE encoding:

64.118 (/LHEcmtt)
```

#### 64.4.4 Hebrew classic font

Hclassic and hcaption fonts are distributed freely from CTAN sites and copyrighted by Joel M. Hoffman, of 19 Hillcrest Lane, Rye, NY 10580 USA, e-mail: 72700.402@compuserve.com.

Hclassic is a modernized Classical Hebrew font (in the same way that Knuth's cmr family is a modernized Roman font — but his fonts are much nicer). Hcaption is a slanted version of hclassic font. Both fonts contain all of the Hebrew consonants, the (rarely used) ligature alef-lamed and two versions of the letter ayin for use with and without vowels. Hclassic also contains all of the vowels found in Hebrew, a symbol for meteg, and dots for use as a dagesh and for differentiating shin and sin letters.

Currently, only the Hebrew consonants (hebalef – hebtav) from these fonts are supported by  $\LaTeX$  and dots directly with Plain TeX macros. We are working on generic vowels and dots support for  $\LaTeX$   $\LaTeX$   $\image$ 

```
64.119 (*LHEclas)
64.120 \DeclareFontFamily{LHE}{clas}{}

                   {<->ssub * clas/m/s1}{}
64.134 (/LHEclas)
```

## 64.4.5 Hebrew shalom fonts

All three shalom fonts (ShalomScript10, ShalomStick10 and ShalomOldStyle10) have been created by Jonathan Brecher, of 9 Skyview Road, Lexington, MA 02173-1112 USA, e-mail: brecher@husc.harvard.edu.

All shalom fonts have been written in PostScript via Fontographer on a Mac. The fonts have been converted to METAFONT by Rama Porrat (e-mail: rama@cc.huji.ac.il), using the utility typo, a font editor + converter between font formats (a commercial product). ShalomScript10.mf is the METAFONT equivalent of ShalomScript.ps, ShalomStick10.mf came from ShalomStick.ps and ShalomOldStyle10.mf originated in ShalomOldStyle.ps.

The fonts differ in the letters' style. ShalomScript10 contains hand writing Hebrew letters; ShalomStick10 contains sans-serif letters, and ShalomOldStyle10 contains old style letters. All three fonts contain vowels and dots (nikud). While converting to METAFONT, letters and symbols within the fonts have been arranged so as to get a usable font for writing Hebrew documents in TeX or IATeX, with as well as without vowels.

Currently, only the Hebrew consonants (hebalef - hebtav) from these fonts

are supported by  $\LaTeX$   $\Sigma \Sigma_{\varepsilon}$ , however one can use vowels and dots directly with PLAIN TEX macros. We are working on generic vowels and dots support for  $\LaTeX$   $\Sigma \Sigma_{\varepsilon}$ .

```
64.135 (*LHEshold)
64.136 \DeclareFontFamily\{LHE\}\{shold\}\{\}

64.233 \langle -nowarn \rangle  {<->sub * redis/bx/n}{}
64.234 \langle +nowarn \rangle  {<->ssub * redis/bx/n}{}
64.235 (/LHEredis)
```

## 64.5 The HE8encoding definition file

The Hebrew font encoding HE8 is based upon an extention by Microsoft to the ISO-8859-8 standard. This is an 8bit encoding. The extentions include hebrew points ("Nikud").

First we define the Codepage 1255; specify a default for the font substitution process for the HE8 encoding and supply a font to be used when all else fails.

```
64.236 \*HE8enc\
64.237 \DeclareFontEncoding{HE8}{}{}
64.238 \DeclareFontSubstitution{HE8}{cmr}{m}{n}
64.239 \DeclareErrorFont{HE8}{cmr}{m}{10}
64.240 \/HE8enc\

Then we define a few commands in the HE8 encoding.

64.241 \*HE8enc\
64.242 \ProvideTextCommand{\textcopyright}{HE8}{\textcircled{\Qlatin{c}}}
64.243 \ProvideTextCommand{\textregistered}{HE8}{\textcircled{\scshape}%
64.244 \Qlatin{r}}
64.244 \Qlatin{r}}
64.244 \Qlatin{r}}
64.244 \Qlatin{r}}
64.244 \Qlatin{r}}
64.244 \Qlatin{r}}
```

### 64.5.1 CHECK HERE FOR HE8 UPDATES

Because not everyone can input Hebrew input text directly from the keyboard we need to define control sequences for all the Hebrew glyphs in the fonts. In addition, we want to support many input encodings for Hebrew and to keep the language definition file (hebrew.ldf) independent of the encoding. Therefore, we exploit the standard  $\LaTeX$   $2\varepsilon$  font encoding mechanism to define control sequences for all the Hebrew glyphs in the fonts in encoding-specific way. The language definition file uses only the control sequences and doesn't need to check the current font or input encoding.

In the LHE encoding (7-bit encoding) all the Hebrew glyphes reside in the *lower* half of the font. Currently, only the Hebrew letters are supported. They use the same positions as the latin small letters in ASCII encoding and the position of '.

Some general symbols:

Letter \hebsin is defined as a synonym of \hebshin:

 $64.307 \langle +HE8enc \rangle \leq in=\hebshin$ 

## 64.6 The font definition files (in HE8 encoding)

#### 64.6.1 Hebrew default font

It uses *OmegaHebrew* font for regular font, *Old Jaffa* font for italic shape and small-caps, *Dead Sea* font for bold face, and *Tel-Aviv* for bold-italic

```
64.309 \DeclareFontFamily{HE8}{cmr}{\hyphenchar}{font45}
{<-> david }{}
64.312 %%%%%% Italicized shape
64.313 \DeclareFontShape{HE8}{cmr}{m}{it}
         <-> davidi }{}
64.315 \DeclareFontShape{HE8}{cmr}{m}{s1}
        {<-> davidi }{}
64 316
64.317 \DeclareFontShape{HE8}{cmr}{m}{sc}
        {<-> david }{}
64.319 %%%%% Bold extended series
64.320 \ \ DeclareFontShape{HE8}{cmr}{bx}{n}
         <-> davidb }{}
{<-> davidb }{}
64.324 %%%%% Bold extended (Italic) series
<-> davidbi }{}
64.327 \ \ DeclareFontShape{HE8}{cmr}{bx}{it}
         <-> davidbi }{}
64.328
64.329 (/HE8cmr)
```

#### 64.6.2 Hebrew sans-serif font

Until we have a real sans-serif font in this distribution, this file will remain a copy of the roman fonts definitions above.

```
{<-> nachlieli }{}
{<-> nachlieli }{}
64.341 %%%%% Bold extended series
{<-> nachlieli }{}
64.344 \ \ DeclareFontShape{HE8}{cmss}{b}{n}
64.345
       {<-> nachlieli }{}
64.346 %%%%%% Bold extended (Italic) series
{<-> nachlieli }{}
64 348
64.349 \DeclareFontShape{HE8}{cmss}{bx}{it}
64.350
       <-> nachlieli }{}
64.351 (/HE8cmss)
```

### 64.6.3 Hebrew typewriter font

Until we have a real sans-serif font in this distribution, this file will remain a copy of the roman fonts definitions above.

```
64.352 (*HE8cmtt)
64.353 \DeclareFontFamily{HE8}{cmtt}{\hyphenchar\font45}
64.354 \ \ DeclareFontShape\{HE8\}\{cmtt\}\{m\}\{n\}
64.355
           <-> miriam }{}
64.356 %%%%% Italicized shape
64.357 \DeclareFontShape{HE8}{cmtt}{m}{it}
64.358
           <-> miriam }{}
64.359 \DeclareFontShape{HE8}{cmtt}{m}{s1}
           <-> miriam }{}
64.360
64.361 \DeclareFontShape{HE8}{cmtt}{m}{sc}
64.362
           <-> miriam }{}
64.363 %%%%% Bold extended series
64.364 \DeclareFontShape{HE8}{cmtt}{bx}{n}
           <-> miriam }{}
64.366 \DeclareFontShape{HE8}{cmtt}{b}{n}
64.367
           <-> miriam }{}
64.368 %%%%%% Bold extended (Italic) series
64.369 \DeclareFontShape{HE8}{cmtt}{bx}{s1}
           <-> miriam }{}
64.371 \DeclareFontShape{HE8}{cmtt}{bx}{it}
64.372
           <-> miriam }{}
64.373 (/HE8cmtt)
```

## 64.6.4 8Bit OmegaHebrew font

OmegaHebrew is a serif hebrew font created by the omega project [FILL IN CRED-ITS] [FILL IN GENERAL SHAPE DESCRIPTION] shapes: [FILL IN]

```
64.374 (*HE8OmegaHebrew)
64.375 \def\OmegaHebrewscale{0.9}

64.471 \\endinput \\ is it needed [tzafrir]
64.472 \(\/ HE8nachlieli\)
```

#### 64.6.13 Hebrew font switching commands

The hebfont package defines a number of high-level commands (all starting with \text.. similar to the standard LATEX  $2_{\varepsilon}$  font-change commands, for example \textbf) that have one argument and typeset this argument in the requested way. These commands are defined for all available Hebrew fonts defined above and change only font parameters but not direction.

For example, to use Hebrew Classic font family, the following sequence of commands should be included in a LATEX  $2_{\varepsilon}$  document:

```
\sethebrew \textclas{Hebrew text printed with Classic fonts} or to use Hebrew with Classic fonts locally:
```

```
\R{\textclas{Hebrew text printed with Classic fonts}}
```

We declare  $\LaTeX$  for commands, e.g. \textjm{...} for all available fonts. Table 36 shows the meanings of all these new high-level commands.

```
\textjm Switches to Jerusalem font which is default regular Hebrew font ("roman" family).

Commands \textrm{...} and old-style {\rm ...} will produce the same result.

64.473 \( *hebfont \)

64.474 \def\ivritex@tmp{HE8}
```

Command	$Corresponds\ to$	Font family
	\rmfamily	Jerusalem font
	\bfseries	Dead Sea font
	\itshape	Old Jaffa font
	\slshape	
	\emph	
	\sffamily	Tel-Aviv font
	\ttfamily	
	\fontfamily{crml}	Carmel fonts
	$\fontfamily{fr}$	Frank-Ruehl fonts
	\fontfamily{redis}	Redis fonts
	\fontfamily{redis}	Classic fonts
	\fontfamily{shold}	Shalom Old Style font
	\fontfamily{shscr}	Shalom Script font
	$\fontfamily{shstk}$	Shalom Stick font

Table 36: Hebrew font-change commands with arguments

The font change commands provided here all start with \text.. to emphasize that they are for use in normal text and to be easily memorable.

```

        64.516 \fi
              Finally, for backward compatibility with LATEX2.09. four old font commands,
           e.g. {\jm ...} are defined too (see Table 37).
        64.517 \if@compatibility
               64.518
        64.519
                                          {\colored{0nomath\jm}}
        64 520
                \DeclareOldFontCommand{\ds}{\normalfont\bfseries\selectfont}%
        64.521
                                          {\coloredge} \{\coloredge \{\coloredge \} \}
```

$Old\ font\ command$	$Font \ name$	Comment
{\jm}	${ m Jerusalem}$	default regular (roman) font
{\ds}	Dead Sea	default bold font
{\oj}	Old Jaffa	default italic and slanted font
		used also to emphasize text
{\ta}	Tel-Aviv	default sans-serif and typewriter font

Table 37: Hebrew old font-change commands for compatibility mode

## 65 Hebrew in LATEX 2.09 compatibility mode

\documentstyle command in the preamble of IATEX document indicates that it is a IATEX 2.09 document, and should be processed in *compatibility mode*. In such documents, one of the following three Hebrew style options can be included:

- 1. hebrew\_newcode indicates that document will use UNIX ISO 8859-8 or Windows cp1255 input encoding, i.e. *Alef* letter will be represented as 224.
- 2. hebrew\_p indicates that document is encoded with IBM PC cp862 encoding, i.e. *Alef* letter will be represented as 128.
- 3. hebrew\_oldcode indicates that document uses old 7-bit encoding, as defined in Israeli Standard 960, i.e. *Alef* is character number 96.

Note, that other hebrew-related styles, such as **hebcal** can be included *after* the abovenamed Hebrew style option, for example:

```
\documentstyle[12pt,hebrew_p,hebcal]{report}.
```

Any Hebrew document which compiled under LATEX 2.09 should compile under compatibility mode, unless it uses low-level commands such as \tenm.

## 65.1 The DOCSTRIP modules

The following modules are used in the implementation to direct DOCSTRIP in generating the external files:

```
newcode produce hebrew_newcode.sty
pccode produce hebrew_p.sty
oldcode produce hebrew_oldcode.sty
```

## 65.2 Obsolete style files

For each of the Hebrew IATEX 2.09 Hebrew styles, we produce a file which uses correct input encoding and calls babel with Hebrew and English language options. This means that any styles which say \input hebrew\_newcode.sty or \documentstyle[...hebrew\_newcode...] {...} should still work.

```
65.1 \langle *newcode \mid pccode \mid oldcode \rangle
65.2 \NeedsTeXFormat{LaTeX2e}
65.3 (/newcode | pccode | oldcode)
 65.4 (*newcode)
65.5 \@obsoletefile{hebrew.sty}{hebrew_newcode.sty}
65.6 \RequirePackage [8859-8] { inputenc}
65.7 \langle \text{/newcode} \rangle
65.8 (*pccode)
65.9 \@obsoletefile{hebrew.sty}{hebrew_p.sty}
65.10 \RequirePackage [cp862] {inputenc}
65.11 (/pccode)
65.12 (*oldcode)
65.13 \@obsoletefile{hebrew.sty}{hebrew_oldcode.sty}
65.14 \RequirePackage [si960] {inputenc}
65.15 (/oldcode)
65.16 \langle *newcode \mid pccode \mid oldcode \rangle
65.17 \RequirePackage [english, hebrew] {babel}
65.18 \langle \text{/newcode} \mid \text{pccode} \mid \text{oldcode} \rangle
```

## 66 The Bahasa Indonesian language

The file bahasa.dtx<sup>79</sup> defines all the language definition macros for the Bahasa Indonesia / Bahasa Melayu language. Bahasa just means 'language' in Bahasa Indonesia / Bahasa Melayu. Since both national versions of the language use the same writing, although differing in pronounciation, this file can be used for both languages.

For this language currently no special definitions are needed or available.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
66.1 (*code)
66.2 \LdfInit\CurrentOption{date\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, bahasa could be an 'unknown' language in which case we have to make it known. So we check for the existence of \logbahasa to see whether we have to do something here.

For both Bahasa Indonesia and Bahasa Malaysia the same set of hyphenation patterns can be used which are available in the file inhyph.tex. However it could be loaded using any of the possible Babel options fot the Indonesian and Malaysian languase. So first we try to find out whether this is the case.

```

## 67 The Bahasa Malaysia language

The file bahasam.dtx<sup>80</sup> defines all the language definition macros for the Bahasa Malaysia language. Bahasa just means 'language' in Bahasa Malaysia. A number of terms differ from those used in bahasa indonesia.

For this language currently no special definitions are needed or available.

The macro \LdfInit takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
67.1 (*code)
67.2 \LdfInit\CurrentOption{date\CurrentOption}
```

When this file is read as an option, i.e. by the \usepackage command, bahasa could be an 'unknown' language in which case we have to make it known. So we check for the existence of \lobahasa to see whether we have to do something here.

For both Bahasa Malaysia and Bahasa Indonesia the same set of hyphenation patterns can be used which are available in the file inhyph.tex. However it could be loaded using any of the possible Babel options fot the Malaysian and Indonesian languase. So first we try to find out whether this is the case.

67.70 \ldf@finish{\CurrentOption} 67.71  $\langle$ /code $\rangle$ 

## 68 Not renaming hyphen.tex

As Don Knuth has declared that the filename hyphen.tex may only be used to designate his version of the american English hyphenation patterns, a new solution has to be found in order to be able to load hyphenation patterns for other languages in a plain-based T<sub>F</sub>X-format. When asked he responded:

That file name is "sacred", and if anybody changes it they will cause severe upward/downward compatibility headaches.

People can have a file localhyphen.tex or whatever they like, but they mustn't diddle with hyphen.tex (or plain.tex except to preload additional fonts).

The files bplain.tex and blplain.tex can be used as replacement wrappers around plain.tex and lplain.tex to acheive the desired effect, based on the babel package. If you load each of them with iniTEX, you will get a file called either bplain.fmt or blplain.fmt, which you can use as replacements for plain.fmt and lplain.fmt.

As these files are going to be read as the first thing  $iniT_EX$  sees, we need to set some category codes just to be able to change the definition of  $\inv input$ 

```
68.1 \*ebplain | blplain\\
68.2 \catcode'\{=1 % left brace is begin-group character
68.3 \catcode'\}=2 % right brace is end-group character
68.4 \catcode'\#=6 % hash mark is macro parameter character
```

Now let's see if a file called hyphen.cfg can be found somewhere on TeX's input path by trying to open it for reading...

```
68.5 \setminus \text{openin 0 hyphen.cfg}
```

If the file wasn't found the following test turns out true.

```
68.6 \ifeof0
68.7 \else
```

When hyphen.cfg could be opened we make sure that it will be read instead of the file hyphen.tex which should (according to Don Knuth's ruling) contain the american English hyphenation patterns and nothing else.

We do this by first saving the original meaning of \input (and I use a one letter control sequence for that so as not to waste multi-letter control sequence on this in the format).

```
68.8 \let\a\input
```

Then \input is defined to forget about its argument and load hyphen.cfg instead.

```
68.9 \def\input #1 {%
68.10 \let\input\a
68.11 \a hyphen.cfg
```

Once that's done the original meaning of \input can be restored and the definition of \a can be forgotten.

```
68.12 \let\a\undefined 
 68.13 } 68.14 \fi 68.15 \label{fi} 68.15 \label{fi}
```

Now that we have made sure that hyphen.cfg will be loaded at the right moment it is time to load plain.tex.

```
68.16 \langle bplain \rangle \setminus a plain.tex 68.17 \langle blplain \rangle \setminus a lplain.tex
```

Finally we change the contents of \fmtname to indicate that this is *not* the plain format, but a format based on plain with the babel package preloaded.

```
68.18 \def\fmtname{babel-plain}
68.19 \def\fmtname{babel-plain}
```

When you are using a different format, based on plain.tex you can make a copy of blplain.tex, rename it and replace plain.tex with the name of your format file.

## 69 Support for formats based on PlainTeX

The following code duplicates or emulates parts of IATEX  $2_{\varepsilon}$  that are needed for babel.

When \addialect is still undefined we are making a format. In that case only the first part of this file is needed.

```
69.3 \def\@empty{}
```

We need to define \loadlocalcfg for plain users as the LATEX definition uses \InputIfFileExists.

```
\def\loadlocalcfg#1{%
69.4
69.5
       \openin0#1.cfg
       \ifeof0
69.6
         \closein0
69.7
       \else
69.8
         \closein0
69 9
         69.10
         \immediate\write16{* Local config file #1.cfg used}%
69.11
          \immediate\write16{*}%
69.12
         }
69.13
69.14
         \input #1.cfg\relax
69.15
       \fi
```

We have to execute \@endofldf in this case

```
69.16 \@endofldf
69.17 }
```

We want to add a message to the message  $\LaTeX$  2.09 puts in the \everyjob register. This could be done by the following code:

```
\let\orgeveryjob\everyjob
\def\everyjob#1{%
  \orgeveryjob\#1}%
  \orgeveryjob\expandafter{\the\orgeveryjob\immediate\write16{%
      hyphenation patterns for \the\loaded@patterns loaded.}}%
  \let\everyjob\orgeveryjob\let\orgeveryjob\@undefined}
```

The code above redefines the control sequence \everyjob in order to be able to add something to the current contents of the register. This is necessary because the processing of hyphenation patterns happens long before LATEX fills the register.

There are some problems with this approach though.

- When someone wants to use several hyphenation patterns with SUTEX the above scheme won't work. The reason is that SUTEX overwrites the contents of the \everyjob register with its own message.
- Plain TeX does not use the \everyjob register so the message would not be displayed.

To circumvent this a 'dirty trick' can be used. As this code is only processed when creating a new format file there is one command that is sure to be used, \dump. Therefore the original \dump is saved in \org@dump and a new definition is supplied.

```
 \begin{array}{lll} 69.18 & \texttt{\let}\circ\texttt{rig}\texttt{@dump}=\texttt{\log}\\ 69.19 & \texttt{\log}\texttt{\log}\texttt{\log}\texttt{\log}\texttt{\log} \end{array}
```

To make sure that IATEX 2.09 executes the \@begindocumenthook we would want to alter \begin{document}, but as this done too often already, we add the new code at the front of \@preamblecmds. But we can only do that after it has been defined, so we add this piece of code to \dump.

```
69.20 \ifx\@ztryfc\@undefined
69.21 \else
69.22 \toks0=\expandafter{\@preamblecmds}
69.23 \edef\@preamblecmds{\noexpand\@begindocumenthook\the\toks0}
69.24 \def\@begindocumenthook{}
69.25 \fi
```

This new definition starts by adding an instruction to write a message on the terminal and in the transcript file to inform the user of the preloaded hyphenation patterns.

```
69.26 \everyjob\expandafter{\the\everyjob% 69.27 \immediate\write16{\the\toks8 loaded.}}%
```

Then everything is restored to the old situation and the format is dumped.

```
69.28 \let\dump\orig@dump\let\orig@dump\@undefined\dump}
69.29 \expandafter\endinput
69.30 \fi
```

The rest of this file is not processed by iniTeX but during the normal document run. A number of LaTeX macro's that are needed later on.

```

69.144 \bbl@tmpa
```

 $\text{IAT}_{\text{E}}X$  has a macro to check whether a certain package was loaded with specific options. The command has two extra arguments which are code to be executed in either the true or false case. This is used to detect whether the document needs one of the accents to be activated (activegrave and activeacute). For plain  $\text{T}_{\text{E}}X$  we assume that the user wants them to be active by default. Therefore the only thing we do is execute the third argument (the code for the true case).

```
69.145 \det \ensuremath{\mathbb{G}} 145 \ensuremath{\mathbb{G}} 146 \ensuremath{\mathbb{\mathbb{G}}} 3}
```

The LATEX macro \@ifl@aded checks whether a file was loaded. This functionality is not needed for plain TeX but we need the macro to be defined as a no-op.

```
69.147 \det 0ifl0aded#1#2#3#4{}
```

For the following code we need to make sure that the commands  $\$  and  $\$  are not fully equivalent to their  $\$   $\$   $\$  versions; just enough to make things work in plain  $\$  TeXenvironments.

```

69.323 \def\cf@encoding{OT1}
   Currently we only use the \LaTeX 2\varepsilon method for accents for those that are known
   to be made active in some language definition file.
69.324 \ \ DeclareTextAccent{\"}{0T1}{127}
69.325 \DeclareTextAccent{\','}{OT1}{19}
```

```
69.326 \label{lem:cont} $$69.327 \DeclareTextAccent{^`}_{0T1}_{18}$$ $$69.328 \DeclareTextAccent{^`}_{0T1}_{126}$
```

The following control sequences are used in  $\mathtt{babel.def}$  but are not defined for PLAIN  $T_FX$ .

```
 69.329 \label{textquotedblieft} $\{0T1\} \{92\} $ 69.330 \leclareTextSymbol{\textquotedblright} \{0T1\} \{`\"\} $ 69.331 \leclareTextSymbol{\textquoteleft} \{0T1\} \{'\'\} $ 69.332 \leclareTextSymbol{\textquoteright} \{0T1\} \{'\'\} $ 69.333 \leclareTextSymbol{\i} \{0T1\} \{16\} $ 69.334 \leclareTextSymbol{\ss} \{0T1\} \{25\} $
```

For a couple of languages we need the LATEX-control sequence \scriptsize to be available. Because plain TEX doesn't have such a sofisticated font mechanism as LATEX has, we just \let it to \sevenrm.

```
69.335 \ifx\scriptsize\@undefined
69.336 \let\scriptsize\sevenrm
69.337 \fi
69.338 \/code\
```

# Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.

## Change History

3.0 \clqq: Added \leavevmode to allow an opening quote at the beginning of a paragraph	
albanian-1.0a General: Started first version of the file	283
albanian-1.0b	
General: A number of corrections in the translations from Adi Zaimi albanian-1.0c	283
General: Small documentation fix	283
babel 2.0a	
General: Added text about german.stybabel 2.0b	. 1
General: Changed order of code to prevent plain $T_EX$ from seeing all of it babel 2.1	. 1
General: Modified user interface, \langTeX no longer necessary	. 1
babel 2.1a  General: Incorporated Nico's comments	. 1
babel 2.1b  General: rename \language to \current@language	
babel 2.1c	
General: abstract for report fixed, missing }, found by Nicolas Brouard babel 2.1d	. 1
General: Missing right brace in definition of abstract environment, found by Werenfried Spit	
babel 2.1e  General: Incorporated more comments from Nico	1
babel 2.2	
General: Renamed \newlanguage to \addlanguagebabel 2.2a	. 1
General: Modified the documentation somewhatbabel 3.0	. 1
General: Moved part of the code to hyphen.doc in preparation for T <sub>E</sub> X 3.0	. 1
babel 3.0a General: Updated comments in various places	1
\iflanguage: Added \@bsphack and \@esphack\selectlanguage: Added \@bsphack and \@esphack	$\frac{22}{24}$
Replaced \gdef with \defbabel 3.0b	25
General: Removed some problems in change log	. 1
babel 3.0c	-1
General: Renamed babel.sty and latexhax.sty to .com\iflanguage: Added comment character after #2	
\selectlanguage: Made \selectlanguage robust	
babel 3.0d	20
\@noopterr: Added a percent sign to remove unwanted white space	30
General: Removed use of \@ifundefined	19
\doc@style: Removed use of \@ifundefined	57
\iflanguage: Removed space hacks and use of \@ifundefined	
Removed superfluous \expandafter	22
\process@language: Added the collection of pattern names	39

Reinserted \expandafter	32
Removed superfluous \expandafter	32
\selectlanguage: Removed space hacks and use of \@ifundefined	$^{24}$
Removed superfluous \expandafter	24
babel 3.1	
General: Added the support for active characters and for extending a macro	. 1
Removed definition of \if@restonecol	57
Removed the need for latexhax	. 1
\addto: Added macro	50
\readconfigfile: Removed the extra if control sequence	34
Removed use of \toks0	34
\selectlanguage: \originalTeX should only be executed once	25
babel 3.2	
General: Some Changes by br	. 1
\adddialect: Added \relax	22
\addlanguage: Added a %, removed by	21
\babel@beginsave: Added macro	49
\babel@save: Added macro	49
\babel@savecnt: Added macro	49
\babel@savevariable: Added macro	49
\bbl@add@special: Added macro	35
\bbl@remove@special: Added macro	36
\iflanguage: Rephrased \ifnum test	22
\selectlanguage: Modified to allow arguments that start with an escape char-	
acter	23
babel 3.2a	
General: Fixups of the code and documentation	. 1
\originalTeX: Set \originalTeX to \empty, because it should be expandable.	30
\readconfigfile: Free macro space for \process@language	35
\selectlanguage: Added \relax as first command to stop an expansion if	
\protect is empty \dots \cdots \cdos \cdots \cdots \cdots \cdots \cdots \cdots \cdots \cdots \cdots	
Added three \expandafters to save macro space for \originalTeX	25
Moved definition of \originalTeX before \extras\(lang\)	$\frac{25}{25}$
Set \originalTeX to \empty, because it should be expandable	$\frac{25}{25}$
Simplified the modification to allow the use in a \write command	$\frac{23}{23}$
babel 3.2b	20
\allowhyphens: Moved macro from language definition files	50
\saveQsfQq: Moved macro from language definition files	50 - 51
\set@low@box: Moved macro from language definition files	51
babel 3.2c	91
	40
\babel@save: missing backslash led to errors when executing \originalTeX	49
babel 3.2d	
\babel@save: saving in \babel@i and restoring from \@babel@i doesn't work	
very well	49
babel 3.2e	
General: Added slovak	73
babel 3.3	0.1
General: \headpagename should be \pagename	61
Added catalan and galician	73
Added turkish	73
Included driver file, and prepared for distribution	. 1
babel 3.4	
General: Added bahasa	73
Added language definition file for bahasa	1

Updated for $\LaTeX$ $\Sigma$ $\Sigma$	
	90
babel 3.4b	-
General: Added a small driver to be able to process just this file	
babel 3.4c	
	15
babel 3.4e	τŋ
	30
	30
\process@language: Added code to detect assignments to left- and right hyphen-	50
	32
\ProvidesLanguage: Redid the identification code, provided dummy definition of	02
5 5 · · · · · · · · · · · · · · · · · ·	14
babel 3.4g	
y .	63
babel 3.5a	00
	30
	45
	73
	16
Provided common code to handle the active double quote	
<del>-</del>	45
	42
	42
	30
	45
	24
\initiate@active@char: Added a check for right quote and adapt \pr@m@s if	47
	38
	36
	30
babel 3.5b	50
	16
	73
	16
	15
	36
	64
	33
	31
\process@synonym: added macro	31
	$\frac{31}{34}$
\selectlanguage: Added an extra level of expansion to separate the switching	94
	23
	$\frac{25}{25}$
	$\frac{23}{23}$
-	$\frac{25}{25}$
	20
Store the name of the current language in a control sequence instead of passing the whole macro construct to strip the escape character in the argument of	
	23
babel 3.5c	ں ے
	30
	73

corrected a few typos (PR1652)	1
Repaired a typo (itlaic, PR1652)	51
babel 3.5d	
General: Added british as an alternative for english with a preference for british	
hyphenation	16
Added options to influence behaviour of active acute and grave accents	18
Load french.ldf when it is found instead of frenchb.ldf	16
Load language definition files after the check for the hyphenation patterns .	16
Merged glyphs.dtx into this file	1
\active@prefix: \@protected@cmd has vanished from ltoutenc.dtx	41
\declare@shorthand: Make a 'note' when a shorthand with an argument is defined.	42
\foreignlanguage: Macro added	26
\initiate@active@char: Skip the language-level active char with argument if no shorthands with arguments were defined	40
Skip the user-level active char with argument if no shorthands with arguments were defined	39
\loadlocalcfg: Added macro	70
\pageref: use a different control sequence while making \ref and \pageref ro-	
bust	64
otherlanguage: environment added	26
babel 3.5e	
otherlanguage: changed name	26
babel 3.5f	
\@bibitem: Now use \bbl@redefine	65
\@citex: Now use \bbl@redefine	64
\Otestdef: Complete rewrite of this macro as the same character ended up with	
different category codes in the labels that are being compared. Now use	
\meaning	63
Now use \bbl@redefine	63
Use \strip@prefix only on \bbl@tempa when it is not \relax	63
General: Added a system shorthand for the left quote	45
Added the greek option	16
No need to reset the category code of the tilde as \initiate@active@char now	
correctly deals with active characters	46
Now use the file frenchb.ldf from Daniel Flipo for french support	16
repaired a typo	
replaced \tmp, \bbl@tmp and \bbl@temp with \bbl@tempa	
\aliasshorthand: New command	43
\bbl@disc: Macro moved from language definition files	51
\bbl@redefine: Macro added	61
\bbl@redefinerobust: Define \*foo instead of \foo	62
Macro added	62
\bbl@set@language: Now also define \languagename at this level	24
\bbl@test@token: macro added	37
\bibcite: Now use \bbl@redefine	64
\DJ: New definition of \dj, see PR 2058	53
\frq: corrected spelling of \quilsingl	54
now use \textormath in these definitions	54
\frqq: corrected spelling of \quillemot	54
now use \textormath in these definitions	54
\initiate@active@char: Deal correctly with already active characters, provide	J 1
top level expansion and define all lower level expansion macros outside of the	
\also branch	37

restore the \lccode of the tie	39
Restore the category code of a shorthand char at end of package	38
store the \lccode of the tie before changing it	
use \peek@token to check whether it is safe to proceed 4	0, 41
$\verb \lower@umlaut : Added a \verb \lowhyphens                                     $	56
removed \allowhyphens	56
\newlabel: Now use \bbl@redefine	
\nocite: Now use \bbl@redefine	64
\pageref: Now use \bbl@redefinerobust	64
redefine \*ref if it exists instead of \ref	64
redefine \setref instead of \ref and \pageref in LATEX $2arepsilon$	64
Reverse the previous change as it inhibits the use of active characters in label	s 64
\peek@token: macro added	37
\process@language: Use \empty instead of \@empty as the latter is unknown in	1
plain	. 33
\ProvidesLanguage: Need to temporarily change the definition of \ProvidesFile	
for December 1995 release	. 14
Store version in \fileversion	
\readconfigfile: Moved the fiddling with \dump to bbplain.dtx as it is no	)
longer needed for L $^{A}$ T $_{E}$ X	. 35
\selectlanguage: Added a missing percent character	
Moved check for escape character one level down in the expansion	
otherlanguage*: environment added	26
${ m babel~3.5g}$	
General: Added definition of \Babel	
Added greek	
Added option afrikaans	
Removed the use of \patterns@loaded altogether	
replaced \undefined with \Qundefined to be consistent with $ ext{LAT}_{ ext{EX}}$	
\ifthenelse: Redefinition of \ifthenelse added to circumvent problems with	
\pageref in the argument of \isodd	
\initiate@active@char: Top level expansion of \normal@char char where char	
is already active, should be the expansion of the active character, not the	
active character itself as this causes an endless loop	
\nfss@catcodes: Need to add the double quote and acute characters to \nfss@cat	
to prevent problems when reading in .fd files	
\process@line: Simplified code, removing \bbl@eq@	
\ProvidesLanguage: Save a few csnames; use \bbl@tempa instead of \ProvidesFi	
and store message in \toks8	. 14
babel 3.6a	
\@@vpageref: Redefinition of \@@vpageref added to circumvent problems with	
active: in the argument of \vref when varioref is used	
General: Added welsh	
Removed \babel@core@loaded, no longer needed with the advent of \LdfIni	
\ldf@finish: Macro added	
\ldf@quit: Macro added	
\LdfInit: Macro added	
\main@language: \main@language now also sets \languagename and \l@language	
for use by other packages in the preamble of a document	
\selectlanguage: Check for the existence of \date instead of \l0 babel 3.6b	24
\addto: Also check if control sequence expands to \relax	50
babel 3.6c	90
General: When \LdfInit is undefined we need to load babel.def from babel.st	v 16
Ocheran Which Profitting is underlined we need to load paper. det itolli paper. st	утО

\bbl@main@language: When hyphen.cfg is not loaded in the format \l@english might not be defined; assume english is language 0	30
babel 3.6d	
\foreign@language: Added \relax to prevent disappearance of the first token after this command	27 26
set the language shorthands to 'none' before switching on the extras	27
\foreignlanguage: Introduced \foreign@language \selectlanguage: set the language shorthands to 'none' before switching on the extras	26 25
otherlanguage*: Introduced \foreign@language	26
babel 3.6e	20
General: Added option frenchb an alias for français	16
Added options UKenglish and USenglish	17
babel 3.6f	
General: Added option KeepShorthandsActive	18
\bbl@redefine@long: Macro added	62
\ifthenelse: \ifthenelse needs to be long	67
\initiate@active@char: Made restoring of the category code of shorthand char-	
acters optional	38
\readconfigfile: Added a couple of \expandafters to copy the contents of	
\toks8 into \everyjob instead of the reference	35
babel 3.6i	
\@newl@bel: Now redefine \@newl@bel instead of \@lbibitem and \newlabel .	62
\Otestdef: \OsafeOactivesfalse is now part of the label definition	63
Make sure that shorthands don't get expanded at the wrong moment	63
General: Added basque	73
Added default option	17
Added the Basque option	16
Added the ukrainian option	17
Added the possibility to have a bblopts.cfg file with option declarations.	17
\bbl@afterfi: Made \bbl@afterelse and \bbl@afterfi \long	36
\bbl@test@token: renamed \bbl@token to \bbl@test@token to prevent a clash	
with ArabT <sub>E</sub> X	37
\declare@shorthand: Make it possible to distinguish the constructed control se-	
quences for the case with argument	42
\ifthenelse: Now reset the @safe@actives switch inside the 2nd and 3rd argu-	
ments of \ifthenelse	67
\initiate@active@char: Make shorthands active during .aux file processing .	
Remove the use of \peek@token again	
Remove the use of \peek@token again and make the \active@arg com-	
mands \long	40
\latinencoding: Macro added, moved from .ldf files	19
\latintext: Macro added, moved from .ldf files	20
\markright: Added redefinition of \mark commands	65
\peek@token: Renamed \test@token to \bbl@test@token to prevent a clash with	
ArabT <sub>E</sub> X	37
\system@group: Have a user group called 'user' by default	43
\textlatin: Macro added, moved from .ldf files	20
babel 3.6k	
\latinencoding: Use T1 encoding when it is a known encoding	20

babel 3.6l	
General: Don't load babel.def now, but rather define \LdfInit temporarily in order to load babel.def at the right time, preventing problems with the	
temporary definition of \bbl@redefine	
${ m babel~3.6m}$	
$\verb \latinencoding: Can't use \verb \latinencoding: Can't use $	20
babel 3.6n	
\latinencoding: Added a check for 'manual' selection of T1 encoding, without loading fontenc	$\frac{20}{20}$
babel 3.60	
General: Moved the rest of the font encoding related definitions to their original	
placebabel 3.6p	
General: Added the ngerman and naustrian options	17
	11
babel 3.6q	20
\latinencoding: Better solution then parsing \@filelist, use \@ifl@aded babel 3.6r	20
General: We do need to load babel.def right now as \ProvidesLanguage needs	
to be defined before the .ldf files are read and the reason for for 3.6l has	
babel 3.6s	16
\bibcite: Need to determine 'online' which definition of \bibcite is needed .	64
babel 3.6u	04
\latinencoding: Moved this code to babel.def	20
babel 3.6v	20
\bblQbibcite: Macro \bblQbibcite added	65
\bbl@cite@choice: Macro \bbl@cite@choice added	65
\bibcite: Also check for cite it can't handle \@safe@activesfalse in its second argument	
babel 3.7a	04
\OnewlObel: Call \OsafeQactivestrue directly	62
\Otestdef: Removed \OsafeOactivesfalse from the label definition	63
General: Added icelandic	73
Added the hebrew option	17
Added the icelandic option	17
Added the polutonikogreek option	16
No longer define the control sequence \KeepShorthandsActive	18
Now need packages tlenc and supertabular to be loaded; the documentation	
for icelandic needs its .ldf file to be present	
\allowhyphens: Make \allowhyphens a no-op for T1 fontencoding	50
\bbl@switch@sh: Added command	44
\foreignlanguage: Added executing \originalTeX	26
\grq: Make the definition of \grq dependent on the font encoding	54
\grqq: Make the definition of \grqq dependent on the font encoding	54
\iflamguage: Now evaluate the \ifnum test after the \fi from the \ifx test and use \Offirstoftwo and \Osecondoftwo	22
\initiate@active@char: Commented out peek@token and \test@token as short-	
hands are made expandable again	36
Use \@ifpackagewith to determine whether shorthand characters need to re-	55
main active	38
\LaTeX: Make TeX and LATeX logos encoding-independent	67
\process@language: Read pattern files in a group	32
<del>-</del>	

\ProvidesLanguage: Added macro to prevent problems with unexpected \Provides	File
in plain formats because of babel.	14
Removed superfluous braces	15
\shorthandoff: Added command	44
\shorthandon: Added command	44
babel 3.7b	
General: Added Latin	73
Added the latin option	17
\ifflanguage: Slight enhancement: added braces around first argument of \bbl@afterfi	22
babel 3.7c	
General: Added an error message for when no language option was specified	18
Added hebrew and serbian	73
Added support for language attributes	46
Added ukrainian	73
define \adddialect before loading plain.def here	19
No longer us a redefinition of an internal macro, just check $\verb \bbl@main@language $	
and load babel.def	18
Removed redefinition of \@roman and \@Roman	67
set the correct language attribute for polutoniko greek	16
\initiate@active@char: Only execute \initiate@active@char once for each	
character	37
\markright: Avoid expanding the arguments by storing them in token registers	65
Removed the use of \head@lang (PR 2990)	65
\process@language: Added the execution of the contents of \toks@	33
Also store \languagename for possible later use in \process@synonym	32
need to set hyphenmin values globally	32
Only set hyphenmin values when the pattern file changed them  Set \lefthyphenmin to \m@ne inside the group; explicitly set the hyphenmin	33
parameters for language 0	32
\process@line: added an extra argument in order to prevent a trailing space from becoming part of the control sequence when defining a synonym (PR	0.1
2851)	31
\process@synonym: Now also store hyphenmin parameters for language synonyms	32
Use a token register to temporarily store a command to set hyphenmin param-	
eters for the synonym which is defined $before$ the first pattern file is processed babel $3.7d$	31
General: Fixed a few typos in \changes entries which made typesetting the code	
<pre>impossible</pre>	1
	37
babel 3.7e	
General: Added missing hebrew files	73
\bbl@clear@ttribs: When \bbl@attributes is undefined this should be a no-op \initiate@active@char: pass the argument on with braces in order to prevent	49
it from breaking up	40
previous change was rubbish; use \let instead of \edef	37
hyphenrules: Added environment hyphenrules	27
babel 3.7f	
General: Added bulgarian	73
Added samin	73
Added the bulgarian option	16

Added the samin option	17 33 47
\bbl@prim@s: Need to redefine \prim@s as well as plain TEX's definition uses	
\next	45
\bbl@set@language: Macro \bbl@set@language introduced	$^{24}$
0	67
\initiate@active@char: Added an extra shorthand combination on user level to	
catch an interfering \protect	41
Insert a check for math mode in the definition of \normal@char'	38
Introduced an extra level of expansion in the definition of an active caret	38
Make an exception for the active caret which needs an extra level of expansion	39
remove the braces again	40
The redefinition needs to take place one level higher, \prim@s needs to be	
	38
\process@language: Allow for the encoding to be used as part of the language	
1 11	27
\save@sf@q: PR3119, don't start a paragraph in a local group	51
\selectlanguage: Use \aftergroup to keep the language grouping correct in	
auxiliary files PR3091	23
babel 3.7g	
\@citex: The shorthands need to be deactivated for the second argument of	
\@citex only	64
General: Added option acadian	16
Added option canadian	16
Added option canadien	16
$\verb \initiate@active@char : use \verb \textormath  to get rid of the \verb \fi  (PR 3266)$	38
babel 3.7h	
General: Added a number of missing comment characters which caused spurious white space	. 1
babel 3.7j	
General: only load frenchb.ldf	16
\bbl@pop@language: Introduce the language stack mechanism	23
	24
\FOREIGNLANGUAGE: Define \FOREIGNLANGUAGE unconditionally	69
\substitutefontfamily: create file with lowercase name	18
\textlatin: added \leavevmode to prevent a paragraph starting inside the group	20
otherlanguage: rely on \selectlanguage to keep track of the nesting	
\useshorthands: The change from 11/112001 was incomplete	
When T <sub>F</sub> X has seen a character its category code is fixed; need to use a 'stand-	
in' for the call of \bbl@activate	43
babel 3.7k	
\textlatin: Use \DeclareTextFontComand	20
babel $3.7\mathrm{m}$	
\@mkboth: added \bbl@restore@actives to the mark	66
\@noopterr: Macro added	30
General: Added the interlingua option	17
\bbl@pop@language: Removed the superfluous empty definition of \bbl@pop@langu	
(37-34-94-1-1-1-1-1-1-1-1-1-1-1-1-1-1-1-1-1-1	$^{24}$
\bbl@restore@actives: New macro added	42
\markright: added \bbl@restore@actives to the mark	65
\selectlanguage: Check for the existence of both \10 and \date	

babel 3.70	
\active@prefix: Added handling of the situation where \protect is set to	
\@unexpandable@protect	41
\ldf@finish: Also restore the category code of the equals sign	29
\ldf@quit: Also restore the category code of the equals sign	29
\LdfInit: make sure the equals sign has its default category code	28
\vrefpagenum: Added redefinition of \vrefpagenum which deals with ranges of	
pages	68
babel 3.8a	
General: Added interlingua	73
Also load package url	71
babel 3.8b	
\bbl@sh@select: Added command	41
\declare@shorthand: We need to support shorthands with and without argument	
in different groups; added the name of the group to the storage macro	42
\frq: Made \flq and \frq fontencoding dependent	54
\frqq: Made \flqq and \frqq fontencoding dependent	54
\grq: Made \glq fontencoding dependent as well	54
\grqq: Made \grqq fontencoding dependent as well	54
\hhline: added \string to prevent unwanted expansion of the colon	68
\initiate@active@char: Now use \bbl@sh@select	
babel 3.8c	10
\@mkboth: No need to add anything to an empty mark, prevented this by checking	
the contents of the arguments	66
General: Added option australian	16
Added the newzealand option	17
\markright: No need to add anything to an empty mark; prevented this by	
checking the contents of the argument	65
babel 3.8e	
General: Many enhancements to the text by Andrew Young	1
babel 3.8f	
\@mkboth: Make the definition independent of the original definition; expand	
\languagename before passing it into the token registers	66
\markright: Make the definition independent of the original definition; expand	
\languagename before passing it into the token registers	65
babel 3.8g	
\Ref: We also need to adapt \Ref which needs to be able to uppercase the first	
letter of the expansion of \ref	68
babel 3.8h	
General: added malay, meyaluy and bahasam for the Bahasa Malaysia support .	16
Added albanian and bahasam	73
Added option albanian	16
added synonyms indonesian, indon and bahasai for the original bahasa (indone-	
sia) support	16
babel 3.8j	
\@mkboth: Added setting of \@mkboth (PR 3826)	66
\bbl@switch@sh@on: Added a group in order to protect the current lowercase	
code of the tilde (PR 3851)	45
\pdfstringdefDisableCommands: Inform hyperref to use shorthands at system	
level (PR4006)	69
hyphenrules: Also set the hyphenmin paramters to the correct value (PR3997)	27
babel 3.81	
\bbl@main@language: Use \bbl@patterns	30
\hhl@natterns: Macro added	27

\foreign@language: use \bbl@patterns	$^{24}$
bahasa-0.9c	
General: Now use \@patterns to produce the warning	
babel.def 446,	449
bahasa-1.0b	
\captionsbahasa: $\operatorname{Added}$ \proofname for $\operatorname{AMS-LATEX}$	447
\captionsbahasam: $\operatorname{Added}$ \proofname for $\operatorname{AMS-LAT}_{EX}$	450
bahasa-1.0d	
General: Replaced \undefined with \@undefined and \empty with \@empty for	r
consistency with LATEX 446,	449
\captionsbahasa: Replaced 'Proof' by 'Bukti' (PR2214)	447
\captionsbahasam: Replaced 'Proof' by 'Bukti' (PR2214)	450
bahasa-1.0e	
General: Moved the definition of \atcatcode right to the beginning 446,	449
Now use \ldf@finish to wrap up 448,	451
Now use \LdfInit to perform initial checks 446,	449
\bahasahyphenmins: use \bahasahyphenmins to store the correct values	448
\bahasamhyphenmins: use \bahasamhyphenmins to store the correct values	450
bahasa-1.0f	
\datebahasa: Use \edef to define \today	447
\datebahasam: Use \edef to define \today	450
bahasa-1.0g	
\datebahasa: Februari should be spelled as Pebruari	447
\datebahasam: Februari should be spelled as Pebruari	450
bahasa-1.0h	
\bahasahyphenmins: Now use \providehyphenmins to provide a default value	448
\bahasamhyphenmins: Now use \providehyphenmins to provide a default value	450
\captionsbahasa: Added \glossaryname	447
\captionsbahasam: Added \glossaryname	450
bahasa-1.0i	
\captionsbahasa: Inserted translation for Glossary	447
\captionsbahasam: Inserted translation for Glossary	450
bahasa-v1.0k	
General: Make it possible that this file is loaded by variuos options	446
bahasam-0.9f	
General: A number of changes to make this specific to Bahasa Mayasia	449
bahasam-1.0k	
\captionsbahasam: Inserted changes from Awangku Merali	450
\datebahasam: Februari restored to BM spelling; see Collins Kamus Dwibahasa	ì
2005	450
bahasam-v1.0j	
General: Make it possible that this file is loaded by variuos options	449
bahasa 1.0f	
\datebahasa: use \def instead of \edef to save memory	447
\datebahasam: use \def instead of \edef to save memory	450
basque-1.0b	
General: Removed empty groups after guillemot characters	231
\datebasque: use \def instead of \edef	230
Use \edef to define \today to save memory	230
basque-1.0c	
\datebasque: fixed typo in April's name	230

basque-1.0d	
\noextrasbasque: Deactivate shorthands ouside of Basque	230
basque-1.0e	
\basquehyphenmins: Now use \providehyphenmins to provide a default value	230
\captionsbasque: Added \glossaryname	229
basque-1.0f	
General: Changed url's for the patterns file	229
\captionsbasque: Added translation for Glossary	229
bbplain-0.1	220
General: Added redefinition of \dump to add a message to \everyjob	453
bbplain-1.0c	100
General: Add execution of \@begindocumenthook to \@preamblecmds	454
Added definition of \loadlocalcfg	453
Moved the \dump code here from babel.dtx	453
bbplain-1.0d	400
General: Also reset category codes after loading the configuration file as \AtEndOff	) o oleo mo
is undefined in this case	453
	400
bbplain-1.0e	457
General: Added the \newcommand code	
Provide a more complete emulation of \DeclareRobustCommand and \newcomma:	na 455
bbplain-1.0f	455
	459
General: added \@empty	453
Added \textquotedblright and \textquoteright	461
Added definition of \scriptsize	461
Consistently use \Cundefined instead of \undefined	453
Use \toks8 instead of \patterns@loaded	454
bbplain-1.0g	101
General: Added \ss and \i	461
bbplain-1.0h	
General: Only load the necessary parts into the format, let this file be read agian	
by babel.def	453
bbplain-1.0i	
General: \document is not a LATEX2.09-only command; AMSTEXdefines it too:	
now use \@ztryfc to detect \BTEX2.09	454
bbplain-1.0j	
General: \@begindocumenthook might already be defined	455
Add the definition of \@begindocumenthook to the LATEX2.09 format	454
bbplain-1.0k	455
General: \newcount is an \outer command, can't use it inside an \if construct	
missing \@undefined added	455
bbplain-1.0l	
General: Mixed up the definition of \@tempcntb	457
bbplain-1.0m	
General: Set \if@filesw to \iffalse only for plain TEX	455
bbplain-1.0n	
General: Added \@secondoftwo	454
Added the source for the format wrapper files	452
Repaired typo and added missing \endcsname	455
bbplain-1.0o	
General: Added definition of \in	457
bbplain-1.0p	
Conoral: Added \Oifl@aded as a no-on	457

bbplain-1.0q	
General: Added \@ifundefined	454
bbplain-1.0r	
General: Added \textquotedblleft and \textquoteleft	461
breton-1.0	
General: First release	99
bret on-1.0b	
\captionsbreton: Added \proofname for AMS-LATEX\noextrasbreton: Use the new mechanism for dealing with active chars	99 100
breton-1.0c	
$General: Postpone the \verb \DeclareTextCompositeCommands  untill \verb \AtBeginDocument  the anti-postpone $	
1	102
breton-1.0e	100
General: Now use \ldf@finish to wrap up	102 99
Now use \LdfInit to perform initial checks	
Replaced \undefined with \@undefined and \empty with \@empty for consis-	
tency with LATEX, moved the definition of \atcatcode right to the beginning. breton-1.0f	. 99
\datebreton: use \def instead of \edef	100
Use \edef to define \today to save memory	100
breton-1.0g	100
\noextrasbreton: Deactivate shorthands ouside of Breton	100
breton-1.0h	100
\captionsbreton: Added \glossaryname	99
bulgarian-0.99	00
General: This is a prerelease version of this file. Features needing further testing	
are removed.	342
bulgarian-1.0b	
\extrasbulgarian: Now use \providehyphenmins to provide a default value	351
bulgarian-1.0c	
General: Added missing closing brace	345
\dq: repaired typo	349
bulgarian-1.0d	
General: Change definition of \th only for this language	353
bulgarian-1.0e	
\cdash: Two occurences of \emp were changed into tab followed by emp	350
catalan-1.1	
\captionscatalan: \headpagename should be \pagename	200
catalan-2.0	0.00
General: Removed code to load latexhax.com	200
\captionscatalan: Added some names	200
\extrascatalan: Macro completely rewritten	201
\noextrascatalan: Macro completely rewritten	201
General: Incorporated the changes from spanish.sty	199
catalan-2.1	100
General: Update for PTEX $2arepsilon$	199
catalan-2.1d	100
General: Now use \Conopatterns to produce the warning	200
Removed the use of \filedate and moved identification after the loading of	
babel.def	199
\captionscatalan: Added a few missing translations	200
\textscute: Renamed from \acute as that is a \mathaccent	202

catalan-2.2a	
General: All the code to deal with active characters is now in babel.def	203
\extrascatalan: Handling of active characters completely rewritten\noextrascatalan: All the code for handling active characters is now moved to	201
babel.def	
catalan-2.2b	202
General: Changed mathmode definition of acute shorthands to expand to a single	
prime followed by the next character in the input	204
Made the activation of the grave and acute accents optional	199
\captionscatalan: Added \proofname for AMS-IATEX	200
\datecatalan: Month names in lowercase	200
\Lgem: Added support for typing the catalan "ela geminada" with the macros	
\lgem and \Lgem	204
\noextrascatalan: Make activating the accent characters optional	201
\up: Added definition of macro \up, which can be used to type ordinals	206
catalan-2.2c	
General: Added '' as an axtra shorthand, removed 'n as a shorthand	204
Added shorthands for guillemets	203
cedile now produced by double quote shorthand	203
Removed the use of the tilde for catalan	199
catalan-2.2d	
\captionscatalan: added translation of Proof	200
Translations revised	200
catalan-2.2e	
General: Added " as an axtra shorthand	203
Added vertical bar as argument to active acute	204
\L.L: Added redefinition of \l and \L	205
\noextrascatalan: Need to split up the \@ifpackagewith statements	201
Now give the apostrophe a lowercase code	201
\up: Now use \textsuperscript and make \up robust	206
catalan-2.2f	
General: Replaced \undefined with \@undefined and \empty with \@empty for	r
consistency with LATEX	
\Lgem: Added a check for math mode as the use of \lgem and \Lgem in math	
mode is not sensible	204
catalan-2.2g	
General: Moved the definition of \atcatcode right to the beginning	199
Now use \ldf@finish to wrap up	206
Now use \LdfInit to perform initial checks	200
catalan-2.2h	
\noextrascatalan: Added some comment signs to prevent unwanted spaces in	1
the output	202
catalan-2.2i	
General: Removed empty groups after guillemot characters	203
\datecatalan: use \def instead of \edef	200
Use \edef to define \today to save memory	200
catalan-2.2k	200
General: A wrong \changes entry made typesetting impossible	199
	199
catalan-2.21	201
\noextrascatalan: Don't forget do deactivate the shorthands	201
Make sure that the grave accent has catcode 12 before it is made \active .	201
catalan-2.2m	200
$\colone{Added} \colone{Added} \colone{Addded} \colone{Addded} \colone{Addded} \colone{Adddod} \colone{Addddod} \colone{Addddod} \colone{Addddod} A$	200

catalan-2.2n	
\catalanhyphenmins: Set the hyphenation parameters both to two as required	l
by cahyph.tex	
catalan-2.2o	
\L.L: Postpone the redefinition of \l and \L until begin document to prevent	
overwriting by fontenc	
catalan-2.2p	200
\captionscatalan: Inserted translation for Glossary	200
changes-1.0f	200
<u> </u>	าวา
General: The hyphen char needs to appear at the beginning of the line as well.	232
croatian-1.0a	200
General: Renamed babel.sty in babel.com	286
croatian-1.0b	
General: Removed use of \@ifundefined	286
croatian-1.0c	
General: Removed some typos	286
croatian-1.1	
General: Added a warning when no hyphenation patterns were loaded	286
Brought up-to-date with babel 3.2a	286
\captionscroatian: Added \seename, \alsoname and \prefacename	286
croatian-1.2	
\captionscroatian: \headpagename should be \pagename	286
croatian-1.3	
General: Update for LATEX $2arepsilon$	286
croatian-1.3d	
\captionscroatian: Added a few translations	286
croatian-1.3e	
\captionscroatian: Added \proofname for AMS-LATEX	286
croatian-1.3f	
\captionscroatian: Added translation of Proof	286
\datecroatian: in croatian language, the genitive for the name of the month has	
to be used	$^{-286}$
croatian-1.3g	200
General: Now use \ldf@finish to wrap up	287
Now use \LdfInit to perform initial checks	286
Replaced \undefined with \Cundefined and \empty with \Cempty for consis-	
tency with LATEX, moved the definition of \atcatcode right to the beginning.	286
croatian-1.3h	
\datecroatian: sijev{c}nja should be seij\v{c}nja and there should be a	
period after the year	286
croatian-1.3i	
\captionscroatian: Replaced some of the translations with 'better' words	286
\datecroatian: use \def instead of \edef	286
Use \edef to define \today to save memory	286
croatian-1.3j	
\datecroatian: changed \od into \or	286
croatian-1.3k	
\captionscroatian: Added \glossaryname	286
croatian-1.3l	
\captionscroatian: Inserted translation for Glossary	286

dutch-3.2	
General: added case for "y and "Y	84
\extrasafrikaans: Save all redefined macros	83
\noextrasafrikaans: Try to restore everything to its former state	83
Consolidated reset of settends of @ before \diment	01
General: Added reset of catcode of @ before \endinput.	81
Renamed babel.sty in babel.com	81
General: removed typo (allowhpyhens)	84
dutch-3.2c	04
General: Removed code to load latexhax.com	81
removed use of \@ifundefined	
dutch-3.3	J_
General: Rewritten parts of the code to use the new features of babel version 3.1	81
\extrasafrikaans: Macro complete rewritten	83
\noextrasafrikaans: Macro complete rewritten	83
<u>*</u>	

dutch-3.3a	
\@trema: renamed \@umlaut to \@trema	84
General: Added \save@sf@q macro from germanb and rewrote all quote macros to use it	84
Moved code to the beginning of the file and added \selectlanguage call	81
\captionsdutch: added \seename and \alsoname	82
	82
General: Added warning, if no dutch patterns loaded	82
\extrasafrikaans: modified handling of \dospecials and \@sanitize	83
$\label{local-condition} $$ noextrasafrikaans: modified handling of \dospecials and \@sanitize \dots. dutch-3.4b $$$	83
General: moved definition of \allowhyphens, \set@low@box and \save@sf@q to	
babel.com	84
dutch-3.5	
\captionsdutch: \headpagename should be \pagename	82
General: Update or LaTeX2e	81
dutch-3.6c	01
General: Now use \Conopatterns to produce the warning	82
Removed the use of \filedate, moved identification after the loading of ba-	
bel.def	81
	01
General: Moved identification code to the top of the file	81 84
moved the definition of the double quote character at the baseline to	04
glyhps.def	84
Now use \Declaredqdutch to define the functions of the active double quote	84
Removed \dlqq, \drqq, \drqq and \dieresis	84
Rewrote the code with respect to the active double quote character	81
The support macros for the active double quote have been moved to babel.def	84
Use \ddot instead of \@MATHUMLAUT	84
Use more general mechanism of \declare@shorthand	84
\afrikaanshyphenmins: use \dutchhyphenmins to store the correct values	84
\IJ: Changed the kerning in the faked ij to match the dc-version of it	53
dutch-3.7b	00
General: Added "" shorthand	84
$\mathrm{dut}\mathrm{ch} ext{-}3.7\mathrm{c}$	
\captionsdutch: We need the " to be active while defining \captionsdutch dutch-3.7d	82
\captionsdutch: Added \proofname for AMS-LATEX	82
dutch-3.7f	
General: Replaced \undefined with \@undefined and \empty with \@empty for	81
consistency with LATEX	01
General: Merged in the definitions for 'afrikaans'	81
Now use \ldf@finish to wrap up	85
this needs a more complicated check as 'afrikaans' may or may not have its	00
own hyphenation patterns	82
\noextrasafrikaans: Made all definitions dependant on \CurrentOption	83
dutch-3.8b	50
\captionsdutch: Use Bew"ys instead of Bewijs	82
dutch-3.8c	
General: Added the "~ shorthand	84

dutch-3.8e	
General: Added a shorthand with the slash character	85
Forgot to replace 'german' by 'dutch' when copying definition for "~	84
Removed empty groups after double quote characters	84
\dateafrikaans: use \def instead of \edef	83
Use \edef to define \today to save memory	83
\datedutch: use \def instead of \edef	82
Use \edef to define \today to save memory	82
dutch-3.8h	02
\afrikaanshyphenmins: Now use \providehyphenmins to provide a default value	8.1
\captionsdutch: Added \glossarynamedutch-3.8i	82
	0.5
\-: \- should use \bbl@allowhyphens	85
General: "/ should use \bbl@allowhyphens	85
english-2.0a	
General: Added checking of format	96
	86
english-2.1	0.0
General: Reflect changes in babel 2.1	86
english-2.1a	
General: Incorporated Nico's comments	86
english-2.1b	
General: merged USenglish.sty into this file	86
english-2.1c	
General: fixed typo in definition for american language found by Werenfried Spit	
$(\operatorname{nspit}@\operatorname{fys.ruu.nl})$	86

\finishhyphenmins: Now use \providehyphenmins to provide a default value	260
\noextrasfinnish: Deactive shorthands ouside of Finnish	260
finnish-1.3o	
\captionsfinnish: Provided translation for Glossary	258
finnish-1.3p	
\noextrasfinnish: "= should also use \bbl@allowhyphens	260
finnish-1.3q	
General: Small documentation fix	258
	-00
galician 4.3	
General: \ is removed and instead \dots and \dots are changed, by redefining	
\ldotc, \dotc and \textellipsis or \dots	
\sin, \arcsin and \sinh are set to produce the same as \sen, \arcsen and	
\senh	215
Added \msc	212
cosec and senh moved from \galicianoperators to the main group	215
Removed the shorthand for $\varsigma$ . It existed in medieval galician-portuguese, but	
that does not seem a reason to be included here.	209
Removed the shorthands "er and "ER, they don't exist in galician	220
Removed the Spanish et sign.	209
Set the default to \unspacedoperators	$\frac{205}{215}$
Set the default to do	210
german-2.61	210
General: Making germanb behave like german needs some more work besides	2
defining \CurrentOption	
germanb-1.0a	90
General: Incorporated Nico's comments	90
germanb-1.0b	90
General: fixed typo in definition for austrian language found by Werenfried Spit	
nspit@fys.ruu.nl	
germanb-1.0c	90
General: Fixed some typos	90
germanb-1.1	90
0	
General: When using PostScript fonts with the Adobe fontencoding, the dieresis-	
accent is located elsewhere, modified code	
\noextrasaustrian: Added \dieresis	92
germanb-1.1a	0.0
General: Modified the documentation somewhat	90
germanb-2.0	0.0
General: Modified for babel 3.0	90
Now use \adddialect for austrian	91
Now use \adddialect if language undefined	91
germanb-2.0a	0.0
General: Removed some problems in change log	90

germanb-2.0b	
\extrasaustrian: added some comment chars to prevent white space	92
\noextrasaustrian: added some comment chars to prevent white space	92
germanb-2.1	
General: Removed bug found by van der Meer	90
germanb-2.2	
General: Removed global assignments, brought uptodate with german.tex v2.3d	90
\captionsaustrian: \pagename should be \headpagename	91
Removed \global definitions	91
\extrasaustrian: Save all redefined macros	92
\noextrasaustrian: Try to restore everything to its former state	92
germanb-2.2a	0.0
General: Renamed babel.sty in babel.com	90
germanb-2.2d	0.4
General: Removed use of \@ifundefined	91
germanb-2.3	
General: Rewritten parts of the code to use the new features of babel version 3.1	90
germanb-2.3e	
General: Added \save@sf@q macro and rewrote all quote macros to use it	93
Added warning, if no german patterns loaded	91
Brought up-to-date with german.tex v2.3e (plus some bug fixes) [br]	90
\captionsaustrian: Added \prefacename, \seename and \alsoname	91
\dategerman: Added \month@german	92
germanb-2.3h	
General: moved definition of \allowhyphens, \set@low@box and \save@sf@q to	
babel.com	93
germanb-2.4	
\captionsaustrian: \headpagename should be \pagename	91
germanb-2.5	
General: Update or LATEX $2\varepsilon$	90
germanb-2.5c	50
General: Now use \Conopatterns to produce the warning	91
Removed the use of \filedate and moved the identification after the loading	JI
of babel.def	90
germanb-2.6a	90
General: \umlautlow and \umlauthigh moved to glyphs.dtx, as well as \newumlau	
(now \lower@umlaut	93
Moved all quotation characters to glyphs.dtx	93
Moved the identification to the top of the file	90
Rewrote the code that handles the active double quote character	90
Use \ddot instead of \@MATHUMLAUT	93
\noextrasaustrian: All the code to handle the active double quote has been	
moved to babel.def	92
Removeed \3 as it is no longer in german.ldf	92
use \germanhyphenmins to store the correct values	92
germanb-2.6b	
\captionsaustrian: Added \proofname for AMS-LATEX	91
germanb-2.6c	
General: added the \allowhyphens	93
Moved \german@dq@disc to babel.def, calling it \bbl@disc	93
\noextrasaustrian: Use decimal number instead of hat-notation as the hat may	
be activated	92
germanb-2.6d	_
General: Moved the definition of \atcatcode right to the beginning	90

Now use \ldf@finish to wrap up	94 91
Replaced \undefined with \@undefined and \empty with \@empty for consistency with LATEX\captionsaustrian: Construct control sequence on the fly	90 91
\noextrasaustrian: Construct control sequence \extrasgerman or \extrasaustr	
on the fly	92
germanb-2.6f General: Copied the coding for "f from german.dtx version 2.5d	94
use \SS instead of SS, removed braces after \ss	93
\ck: Now use \shorthandon and \shorthandoff	94
\dateaustrian: use \def instead of \edef	92
Use \edef to define \today to save memory	92
\dategerman: use \def instead of \edef	92
Use \edef to define \today to save memory	92
germanb-2.6i	0.0
\noextrasaustrian: Deactivate shorthands ouside of Germangermanb-2.6j	92
\captionsaustrian: Added \glossaryname	91
\noextrasaustrian: Now use \providehyphenmins to provide a default value	92
germanb-2.6k	0.0
\noextrasaustrian: Turn frenchspacing on, as in german.sty	93
germanb-2.6m	0.0
General: Correted a typo	90
General: Moved the definition of \atcatcode right to the beginning	109
Now use \ldf@finish to wrap up	117
Now use \LdfInit to perform initial checks	110
tency with L <sup>A</sup> T <sub>E</sub> X	109
\textgreek: Added a level of braces to keep encoding change local	111
greek-1.0c	
\greek@tilde: Added command greek-1.1	115
\Grtoday: Added macro \Grtoday	113
greek-1.1a	
\dategreek: Fixed typo, Oktwbr'iou instead of Oktobr'iou\greek@Alph: removed two superfluous @'s which made \@alph undefinedgreek-1.1b	112 114
\noextrasgreek: Added setting of \uccodes (after kdgreek.sty)	116
Added shorthand for \char255	116
Made tilde expand to a tilde with \catcode 12	117
greek-1.1c	111
General: Added a couple of symbols, needed for \greeknumeral	117
\noextrasgreek: fixed two typos	116
greek-1.1d	
\dategreek: Macro \gr@month now produces the name of the month greek-1.1e	112
General: Added caption name for proof	111
Most symbols are removed and are now defined in package grsymb	117
\gr@month: Macro added	112
\noextrasgreek: Added lowercase code for v	116
Added uppercase code for special letter "v". Uppercase code for accents is now	
9f, instead of ff	

Shorthand is changed. Active character is now \char159 greek-1.2	116
<u> </u>	110
- 1 · · · · · · · · · · · · · · · · · ·	112
	109
. 1	112
.0	112
, 0	116
Added uppercase codes for "modern" Greek. The old codes are now for "Polutoniko" Greek	116
	116
greek-1.2a	
	111
	112
\noextrasgreek: Need shorthand to exist for "monotoniko" Greek, not "polu-	. 12
toniko" Greek	116
	110
greek-1.2b	
General: Classical Greek is now called "Polutoniko" Greek. The previous name	100
was at least misleading	
· · · · · · · · · · · · · · · · · · ·	112
\gr@num@iii: No longer use \ in the expansion of the \gr@num@x macros as they	
${\rm ned\ to\ be\ expandable}\qquad \qquad 1$	l 15
greek-1.2c	
General: Package grsymb has been eliminated because the CB fonts v2.0 do not	
inlcude certain symbols and so the remaining symbol definitions have been	
$moved\ here\ \dots$	117
This version conforms to version 2.0 of the CB fonts and consequently we added	
a few new symbol-producing commands	L09
greek-1.2e	
\greek@Roman: Moved redefinition of \@roman back to the language specific file	114
greek-1.2f	
\ltx@amp: Now switch the definition of \& from \extrasgreek	115
greek-1.3a	
General: polutoniko is now an attribute to Greek, no longer a 'dialect'	109
	112
greek-1.3b	
\greeknumeral: Added \expandafter and \number (PR3000) in order to make a	
	113
greek-1.3c	
	115
greek-1.3d	. 10
General: Fixed typo, bl'epe ep'ishc instead of bl'pe ep'ishc 111, 1	119
\greek@Roman: \@roman and \@Roman need to be added to \extraspolutonikogreek	
(greekshoman, (sroman and (shoman need to be added to (extrasportion) in the state of the state	
greek-1.3e	114
\greek@Roman: \@roman and \@Roman need not be in \extraspolutonikogreek	
	111
when they are already in \extrasgreek	114
\noextrasgreek: \extrasgreek and \extraspolutonikogreek should be com-	110
	116
greek-1.3f	
	110
greek-1.3g	
. <b>.</b>	110
greek-1.3h	
\captionsgreek: Added \glossaryname 1	111

\greekhyphenmins: Now use \providehyphenmins to provide a default value greek-1.3i	111
\captionsgreek: The final sigma in all names appears as 's' instead of 'c' \noextrasgreek: uc code of 'v' is switched to V so that mixed text appears correctly in headers	
greek-1.3j	110
\noextrasgreek: Because other languages might make the caret active, we can't	+
use the double caret notation here	
greek-1.3k	110
\greek@tilde: Make sure the character " is not active during the definition of	f
\greek@tilde	115
\textgreek: Added \leavevmode as was done with \latintext greek-1.3l	111
General: Commented these lines out as this change has made it into LATEX itself.	117
heb209 1.0a	
General: Initial version. Provides hebrew_newcode, hebrew_oldcode and hebrew_p style files for Late 2.09 (by Boris Lavva)	
${ m hebfdd-1.0a}$	
General: Initial version. Supports only 7-bit LHE font encoding and all available Hebrew T <sub>E</sub> X fonts (by Boris Lavva)	
${ m hebfdd-1.0b}$	
General: fixed lhecmr.fd to use oldjaf10 for a slanted font available Hebrew TEX fonts (by Tzafrir Cohen)	
hebfdd-1.1a	
General: Adding 8-bit HE8 fonts. Note that most of them cannot be distributed with hebLATEX (by Tzafrir Cohen)	
hebfdd-1.2a	
General: Adding configurations for the Culmus fonts, currently 0.90 (by Tzafrir Cohen)	
hebfdd-1.2b	
General: Reinstated the test whether LHE or HE8 is to be used	427
hebinp 1.0a	
General: Initial version. Provides 8859-8, cp862, cp1255, and old 7-bit input encodings (by Boris Lavva)	
hebinp 1.1 General: Renamed hebrew letters: \alef to \hebalef etc. (by Tzafrir Cohen)	419
hebinp 1.1a	
General: Renamed CP1255 nikud \patah to \hebpatah etc. Added the macro \DisableNikud - may not be a good idea (by Tzafrir Cohen)	
hebrew-1.2c	
General: Typo's in the docstrip guards made HE8nachlieli.fd unusable	427
hebrew-2.0b	
\captionshebrew: Added \glossarynamehebrew-2.3h	379
\hebrewencoding: Make LHE the default encoding for compatibility reasons	379
hebrew 0.1  General: Preliminary LateX Hebrew option (by Sergio Fogel)	377
hebrew 0.2	
General: Corrections and additions (by Rama Porrat) $\hdots$ hebrew 0.6	377
General: Additions (by Yael Dubinsky)	377

hebrew 1.2	
General: Bilingual tables, penalties, documentation and more changes (by Yaniv	
Bargury)	7
hebrew 1.30	
General: Font selection, various (by Alon Ziv)	7
hebrew 1.31	
General: Bug fixes (by Alon Ziv) 37	7
hebrew 1.32	
General: Made font-change command for numbers '\protect'ed (by Alon Ziv) 37	7
hebrew 1.33	
General: Made \refstepcounter work using \Cltor (by Alon Ziv) 37	7
hebrew 1.34	
General: Moved font loading to another file. Added \mainsec. Made all text	
strings be produced by control codes (similar to LATEX 2.09 Mar '92). Fixed	
\noindent (by Alon Ziv) 37	7
hebrew 1.35	
General: Moved the texts to a file selected by the current encoding (by Alon Ziv) 37	7
hebrew 1.36	
General: Use T <sub>E</sub> X tricks to redefine \thexxxx without keeping old definitions.	
Use only \@eng for direction/font change (removed \@ltor). Switched from	
use of \mainsec to code taken from babel system (by Alon Ziv) 37	7
hebrew 1.37	
General: Use \add@around in defining font size commands. Small bug fixes (by	
Alon Ziv)	7
hebrew 1.38	
General: \everypar changed so that \noindent works unmodified (by Alon Ziv,	
thanks to Chris Rowley)	7
hebrew 1.39	
General: Redefined primitive sectioning commands. Changed \include so it finds	
.h, .xet, and .ltx files (no extension needed). Reinstated use of \@ltor (by	
Alon Ziv) 37	7
hebrew 1.40	
General: Added the \@brackets hack (by Alon Ziv) 37	7
hebrew 1.41	
General: Reworked towards using NFSS2. Changed some macro names to be more	
logical: renamed \@ltor to \@number, \@eng to \@latin, and (in hebrew.ldf)	
\@heb to \@hebrew (by Alon Ziv) 37	7
hebrew 1.42	
General: Made list environments work better. Fixed the bibliography environment	
(by Alon Ziv)	7
hebrew 2.0a	
General: Completely rewritten for LATEX $2arepsilon$ and babel support. Various input and	
font encodings (with NFSS2) are supported too. The original hebrew.sty is	
divided to a number of packages and definition files for better readability	
and extensibility. Added some user- and code-level documentation inside the	
.dtx and .fdd files, and LATEX-driven installation with hebrew.ins (by Boris	
Lavva) 37	7
hebrew 2.0b	
\hebrewhyphenmins: Now use \providehyphenmins to provide a default value 37	9
hebrew 2.1	
General: corrections from Sivan Toledo: sender name in letter, and section name	
in headings. (by Tzafrir Cohen)	7

hebrew 2.2	
General: renamed hebrew letters to heb* (e.g.: alef renamed to hebalef) (by Tzafrir Cohen)	377
hebrew 2.3	911
General: added several \@ifclassloaded{slides} to allow the use of the slides class. (by Tzafrir Cohen)	
hebrew 2.3a	911
General: The documentation should now be built fine (broken since at least 2.1,	
and probably 2.0) (by Tzafrir Cohen)	377
General: minor clean-ups. The documentation builds now with no warnings. Also removed \R from the caption macro (added in 2.1) Added internal \@ensure@L and \@ensure@L (Is there a real need for them? Maybe should they be exposed?) (by Tzafrir Cohen)	377
hebrew 2.3c	
General: a temporary fix to the \gim macro. Should be replaced by stuff from hebcal. (by Tzafrir Cohen)	
hebrew 2.3d	
General: Initial support for the prosper class. Added \arabicnorl . (by Tzafrir Cohen)	377
hebrew 2.3e	
General: Removing hebtech from this distriution (not relevant to babel), added \HeblatexEncoding. some docs cleanup (by Tzafrir Cohen)	
hebrew 2.3f	
General: redefined \list instead of redefining every environment that uses it. some pscolor handling, removed HeblatexEncoding (don't use 2.3e) (by Tzafrir	
$\operatorname{Cohen})$	377

usorbian-1.0k	
\extrasusorbian: Make sure the caret has the right \catcdoe	371
v2.0	
General: \parindentFFN not changed if already defined (required by JA for cah	-
$\operatorname{gut.cls}).$	
Added warning for OT1 encoding.	150
At BeginDocument, save again the definitions of the 'list' and 'itemize' envis	-
ronments and the values of labelitems. As of frenchb v.1.6, 'ORI' values were	3
set when reading frenchb.ldf, later changes were ignored	150
Footnotes are now printed by default 'à la française' for the whole document.	139
New command \frenchbsetup added for global customisation	142
\bsc: \hbox dropped, replaced by \kernOpt	132
\captionsfrench: 'Fig.' changed to 'Figure' and 'Tab.' to 'Table'	135
Set \CaptionSeparator in \extrasfrench now instead of \captionsfrench	1
because it has to be reset when leaving French.	135
\datefrench: 2 '\relax' added in \today's definition	130
\fBtextellipsis: Added special case for LY1 encoding, see bug report from	
Bruno Voisin (2004/05/18)	142
\nombre: \nombre requires now numprint.styv2.0b	134
General: Footnotes: Just do nothing (except warning) when the bigfoot package	3
is loaded	139
v2.0c	
General: \ThinSpaceInFrenchNumbers added for compatibility with frenchb-1.x.	135
Option ThinSpaceInFrenchNumbers added	142
There is no need to define here numprint's command \npstylefrench, it wil	
be redefined 'AtBeginDocument' by \FBprocess@options	135
m v2.0d	
General: Options og and fg changed: limit the definition to French so that quot	3
characters can be used in German.	142
m v2.0e	
General: New option: StandardLists.	142
m v2.0f	
General: StandardLayout option had no effect on lists. Test moved to \FBprocess	@options
Two typos corrected in option StandardLists: [false] $\rightarrow$ [true] and Standard	
$Layout \rightarrow StandardLists.$	142
m v2.0g	
General: Revert previous change to StandardLayout. This option must see the three flags \FBReduceListSpacingfalse, \FBCompactItemizefalse, and	

\FBStandardItemLabeltrue instead of \FBStandardListstrue, so that later options can still change their value before executing \FBprocess@options. Same thing for option StandardLists	142
\StandardLayout: Flag \iffBStandardLayout not checked by \FBprocess@option low-level flags have to be set one by one.	ıs,
v2.1a	
General: Command \fup added to produce better superscripts than \textsupersc	_
New option: FrenchSuperscripts to define \up as \fup or as \textsuperscript.	149
	142
\datefrench: \today changed (correction in 2.0 was wrong: \today was printed without spaces in toc).	
v2.1b	
	150
\fup: Command \fup changed to use real superscripts from fourier v. 1.6 $v2.1c$	130
General: Added commands \Nos and \nos	132
\degres: Provide a temporary definition (hyperref safe) of \degres in case it has	
to be expanded in the preamble (by beamer's \title command for instance).	133
\up: Provide a temporary definition (hyperref safe) of \up in case it has to be	
expanded in the preamble (by beamer's $\land$ title command for instance)	130
v2.1d	
General: Argument of \ProvidesLanguage changed above from 'french' to 'french' (otherwise \listfiles prints no date/version information). The real	
name of current language (french) as to be corrected before calling \LdfInit.	
1	125
v2.2a	
General: The global layout of the document is no longer changed when frenchb is not the last option of babel (\bbl@main@language). Suggested by Ulrike	
Fischer.	
Values of flags \iffBReduceListSpacing, \iffBCompactItemize, \iffBStandar \iffBIndentFirst, \iffBFrenchFootnotes, \iffBAutoSpaceFootnotes changed default now means 'StandardLayout', it will be changed to 'FrenchLayout'	
AtEndOfPackage only if french is \bbl@main@language	142
language, so GlobalLayoutFrench applies	142
\fup: \newif and \newdimen moved before \ifLaTeXe to avoid an error with	
plainTeX	130
\lower@umlaut: Use \leavevmode\bgroup to prevent problems when this command occurs in vertical mode	55
\umlauthigh: Use \leavevmode\bgroup to prevent problems when this command occurs in vertical mode.	
v3.8d	55
\@notshorthand: Error message added	44
welsh-1.0b	
·	104
welsh-1.0c	104
. 1	103 103

welsh-1.0d	
\captionswelsh: Provided the translation for Glossary	103
\datewelsh: removed 'a viz' from the definition of \today	104
