Preface

In this report we present the `TEX` and `METAFONT` sources of the `XY-pic` package with `TEX`nical commentary. It assumes that you are familiar with the use of `XY-pic` as described in the User's Guide [15] as well as with the fundamentals of `TEX` [6] and `METAFONT` [7].

Overview. Chapter 1 explains the `TEX` sources of the `XY-picture` *kernel* drawing language. Chapter 2 explains the sources of the standard *extensions* providing extended graphic capabilities, and chapter 3 the sources of standard *features* providing specialised notation for particular diagram types. Chapter 5 exposes the `METAFONT` sources of the standard fonts provided in the distribution.

The appendices contain additional information: Appendix A contains answers to all the exercises of the main text. Appendix B summarises the backwards compatibility with `XY-pic` version 2. Appendix C contains the GNU General Public License detailing the conditions of use of `XY-pic`, and appendix D various support files contained in the distribution. Finally a bibliography and the index.

The report includes most of the information in the reference manual [16].

License. Most of the `XY-pic` package is copyright by the individual authors. We have chosen to use the “GNU Copyleft” to make the package available without restriction to as many users as possible and ensure that it is attributed to its authors without risk of persecution. The disclaimer can be found on the inside cover page; the full text of the license is reproduced as appendix C.

Chapter 1

Kernel: xy.doc

After giving an overview of the Xy-pic environment in §1.1, this chapter documents the basic concepts of Xy-pic picture construction in §1.2, including the maintained ‘graphic state’. The following sections give the precise syntax rules of the main Xy-pic constructions: the position language in §1.3, the object constructions in §1.4, and the picture ‘decorations’ in §1.5. §1.6 presents the kernel repertoire of objects for use in pictures; §1.7 documents the interface to Xy-pic options like the standard ‘feature’ and ‘extension’ options.

Section §1.8 documents the more complicated algorithms used to compute directions, edges, and connections.

1.1 The Xy-pic implementation

This section briefly discusses the various aspects of the present Xy-pic kernel implementation of which the user should be aware.

1.1.1 Loading Xy-pic

Xy-pic is careful to set up its own environment in order to function with a large variety of formats. For most formats a single line with the command

```
\input xy
```

in the preamble of a document file should load the kernel (see ‘integration with standard formats’ below for variations possible with certain formats, in particular $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ [10]).

The rest of this section describes things you need to consider if you need to use Xy-pic together with other macro packages, style options, or formats. The less your environment deviates from plain $\text{T}_{\text{E}}\text{X}$ the easier it should be.

File header: Here is what actually happens in the header of `xy.doc`. It contains the copyright message, protection against loading the file more than once, and then bootstrap code to handle category codes and the `DOCMODE` format—we explain each separately below:

```

Privacy: X_Y-pic will warn about control sequences it redefines—thus you can be sure that there are no conflicts between X_Y-pic-defined control sequences, those of your format, and other macros, provided you load X_Y-pic last and get no warning messages like

Xy-pic Warning: ‘...’ redefined.

In general the X_Y-pic kernel will check all control sequences it redefines *except* that (1) generic temporaries like `\next` are not checked, (2) predefined font identifiers (see §1.1.3) are assumed intentionally preloaded, and (3) some of the more exotic control sequence names used internally (like `@{-}`) are only checked to be different from `\relax`.

This is handled by `\xywarnifdefined`—after we have ensured that it is unique itself¹. `\xydef @`, `\xylet @`, and `\xynew@{<type>}` are abbreviations used to this end throughout X_Y-pic instead of `\let`, `\def`, and the `\new<type>` commands.

¹This may seem paranoid but in fact many inconveniences in the T_EX world stem from the fact that somebody copied somebody else's definition of, say, `\xywarnifdefined`, modified it, and then used it in something that somehow got distributed! The ‘flat name space’ problem remains T_EX largest problem as a programming language in this T_EX hackers opinion.

Next some auxiliaries: `\xydefcsname@` is similar to `\xydef@` except that it builds the control sequence with `\csname ... \endcsname` which means that it is `\relax` when undefined—there is thus no way to prevent redefinition of control sequences bound to `\relax` ☹.

```
200 \xydef\xydefcsname@#1{\DN@{#1}\DNii@##1{%
201   \ifx ##1\relax\else \xywarning@{\string'\string##1\string' redefined}\fi
202   \def##1}%
203   \expandafter\nextii@\csname\codeof\next@\endcsname}
```

`\xyletcsnamecsname@` is to `\let` one weird control sequence be the same as another using several `\expandafters`:

```
210 \xydef\xyletcsnamecsname@#1#2{\def\1{#1}\def\2{#2}\DN@##1##2{%
211   \ifx ##1\relax\else \xywarning@{\string'\string##1\string' redefined}\fi
212   \let##1=##2}%
213   \expandafter\expandafter\expandafter\next@
214   \expandafter\csname\expandafter\codeof\expandafter\1\expandafter\endcsname
215   \csname\codeof\2\endcsname}
```

Finally `\codeof`: a useful hack used to allow any characters in control sequences: `\codeof⟨cs⟩` expands to the characters of the control sequence `⟨cs⟩` as a string of ‘other’ characters, *i.e.*, all of category 12 and with a `␣12` after every control sequence. The `⟨cs⟩` must be a macro or it blows up.

```
225 \xywarnifdefined\codeof
226 \xywarnifdefined\codeof@
227 {\catcode'\:=12 % to ensure that all of :-> and <:- are other :-}
228 \gdef\codeof#1{\expandafter\codeof@\meaning#1<-:}
229 \gdef\codeof@#1:->#2<-:#{#2}}
```

Category codes: The situation is complicated by the flexibility of `TEX`’s input format. The culprit is the ‘category code’ concept of `TEX` (*cf.* [6, p.37]): when loaded `XY-pic` requires the characters `␣\{}%` (the first is a space) to have their standard meaning and all other printable characters to have the *same category as when X_Y-pic will be used*—in particular this means that (1) you should surround the loading of `XY-pic` with `\makeatother ... \makeatletter` when loading it from within a `LATEX` package, and that (2) `XY-pic` should be loaded after files that change category codes like the `german.sty` that makes “ active. Some styles require that you reset the catcodes for every diagram, *e.g.*, with `french.sty` you should use the command `\english` before every `\xymatrix`.

We define `\xyuncatcodes` to restore the current catcodes, and `\xycatcodes` to install our own.

Here is an exact list of the category codes which `XY-pic` requires (all standard in plain `TEX`):

character(s)	\	{	}	CR	TAB SP	A–Z a–z	0–9	%
category code	0	1	2	5	10	11	12	14

Furthermore none of the remaining printable ASCII characters

!"#\$%&'()*+,-./:;?@[]^_`{|~

may be of category 0, 1, 2, 9, 14, or 15, because all should be tokens allowed in the replacement text of a `\def`—this also means that they may not be active characters defined to be “`\outer`”!

All other catcodes needed are established using `\xycatcodes` defined above—this is the reason the macros must be loaded at a time where the category codes are stable (otherwise it will make them stable!).

Internally Xy-pic enforces the following category codes:

character	#	\$	&	'	+	-	.	<	=	>	@	'
ASCII code	35	36	38	39	43	45	46	60	61	62	64	96
category code	6	3	4	12	12	12	12	12	12	12	11	12
abbreviation	HASH	DOLL	AND	RQ	PLUS	DASH	DOT	LT	EQ	GT	AT	LQ

with special control sequences named `\add(abbreviation)@` that take an argument and expand to it followed by the original character token, *i.e.*, many tests throughout the program look like `\addDOT@ \ifx \next ...`

```

292 \xywarnifdefined\addAT@
293 \xywarnifdefined\addHASH@
294 \xywarnifdefined\addDOLL@
295 \xywarnifdefined\addAND@
296 \xywarnifdefined\addRQ@
297 \xywarnifdefined\addPLUS@
298 \xywarnifdefined\addDASH@
299 \xywarnifdefined\addDOT@
300 \xywarnifdefined\addLT@
301 \xywarnifdefined\addEQ@
302 \xywarnifdefined\addGT@
303 \xywarnifdefined\addLQ@

305 \xydef@\xymakeADD@#1#2 #3 {\ifnum\catcode#3=6 \def#1##1{##1#2#2}%
306 \else \def#1##1{##1#2}\fi}

308 \xydef@\xyrecat@{\xymakeADD@\addAT@}
309 \xydef@\xyrecat@\xyrecat@}
310 \xydef@\xyresetcatcodes{\def\xyrecat@\xyrecat@\xyreuncatcodes
311 \input xyrecat \relax \xyuncatcodes}

313 \xyuncatcodes \xyresetcatcodes \xycatcodes

315 \xydef@\testAND@{\aftergroup\ifx
316 \addAND@\ifx\next\addFalse@\else\addTrue@\fi}}
317 \xydef@\addFalse@{\aftergroup\iffalse}
318 \xydef@\addTrue@{\aftergroup\iftrue}

```

However, it is possible to ‘repair’ the problem in case any of the characters `##&'+-.<=>` ‘change category code:

`\xyresetcatcodes`

will load the file `xyrecat.tex` (version 3.6) to do it.

```

```

The last block of the X_Y-pic header bootstraps the “DOCMODE format” used in .doc variants of X_Y-pic macro files in order to keep documentation and macros together in a literal programming style (this is redundant in the xy.tex macro file where all instances of DOCMODE have been eliminated (see chapter §D.3.2 for how this is accomplished) but it is included anyway since users may load options still in DOCMODE format). The details of DOCMODE are described in xydoc.sty, a special L^AT_EX package used to typeset X_Y-pic documentation; please read it if you intend to write X_Y-pic options.

Integration with standard formats This is handled by the xyidioms.tex file and the integration as a L^AT_EX [10] package by xy.sty.

We input xyidioms.tex from the kernel:

```

349 \input xyidioms

```

xyidioms.doc: This included file provides some common idioms whose definition depends on the used format such that X_Y-pic can use predefined dimension registers etc. and yet still be independent of the format under which it is used. The current version (3.6) handles plain T_EX (version 2 and 3 [6]), $\mathcal{A}\mathcal{M}\mathcal{S}$ -T_EX (version 2.0 and 2.1 [18]), L^AT_EX (version 2.09 [9] and 2 ϵ [10]), $\mathcal{A}\mathcal{M}\mathcal{S}$ -L^AT_EX (version 1.0, 1.1 [2], and 1.2), and eplain (version 2.6 [3])².

```

24 \let\xyidiomsloaded=\empty

```

Header: This is a separate file so that we can abort the definitions easily using `\endinput`.

Scratch registers: All the formats currently treated allow the use of the following plain \TeX scratch register conventions (*cf.* [6, p.346])

- `\count@` is available as a local scratch counter register.
- `\dimen@`, `\dimen@i`, `\dimen@ii`, `\dimen3` to `\dimen9`, and `\dimen255` are available as scratch dimension registers.
- `\skip@`, `\skip1` to `\skip9`, and `\skip255` are available as scratch skip registers.
- `\toks@` and `\toks1` to `\toks9` are available as scratch token lists.
- `\boxz@` and `\box1` to `\box9` are available as scratch box registers.

with the constraint that `\global` should never (always) be used when assigning to number 0, 2, 4, 6, 8, and 255 (1, 3, 5, 7, and 9).

Xy-specific scratch registers: We first give new names to dimension registers 4, 6, and 8, since none of the formats do that: `\A@`, `\B@`, and `\R@` are specific to Xy-pic and will be referred to as *A*, *B*, and *R* in comments.

```

84 \xywarnifdefined\A@ \dimendef\A@=4
85 \xywarnifdefined\B@ \dimendef\B@=6
86 \xywarnifdefined\R@ \dimendef\R@=8

```

Some shared scratch registers are defined last.

Idioms: First check that `\undefined` is indeed undefined...or rather: the same as an extremely unlikely control sequence that we are making up:

```

97 \ifx\undefined\AveryUNLIKELYYc@ntr@lSEQUENCE@@\else
98 \errmessage{Xy-pic Error: \string\undefined\space defined.}\fi

```

These idioms are so common they are just conditionally defined:

```

104 \ifx\undefined\literal@ \def\literal@#1{#1}\fi
105 \ifx\undefined\eat@ \def\eat@#1{\}\fi

107 \xydef@\xyFN@{\futurelet\next} % Now private because of AMS-LaTeX change.
108 \ifx\undefined\DN@ \def\DN@{\def\next@}\fi
109 \ifx\undefined\DNii@ \def\DNii@{\def\nextii@}\fi

111 \ifx\undefined\setboxz@h\def\setboxz@h{\setbox\z@\hbox}\fi
112 \ifx\undefined\wdz@ \def\wdz@{\wd\z@}\fi
113 \ifx\undefined\boxz@ \def\boxz@{\box\z@}\fi

115 \ifx\undefined\W@ \def\W@{\immediate\write16 }\fi

117 \ifx\undefined\space@ \def\space@.{\futurelet\space@\relax}\space@. \fi

119 \ifx\undefined\notempty \def\notempty#1{T\if @#1@F\else T\fi}\fi

```

Delayed setup: This is used when it is advantageous to delay loading of something until after the preamble, *i.e.*, after all options, *etc.*, have been loaded. This is particularly true for nested `\xywithoption` uses that will otherwise be executed repeatedly. Currently properly supported with L^AT_EX 2_ε and the `amspt` style of $\mathcal{A}\mathcal{M}\mathcal{S}$ -T_EX.

```

131 \xydef@xysetup@dummy#1{\xyuncatcodes#1}
132 \xywarnifdefinedxysetup@@
134 \ifx\AtEndDocument\undefined
135 \expandafter\ifx\cname amspt.sty\endcsname\relax
136 \letxysetup@@=\xysetup@dummy
137 \else
138 \defxysetup@@#1{%
139 \expandafter\def\expandafter\topmatter\expandafter{\topmatter
140 #1xyuncatcodes}}\fi
141 \else
142 \defxysetup@@#1{\AtBeginDocument{#1xyuncatcodes}}
143 \fi
145 \ifxxysetup@@xysetup@dummy\else
146 xysetup@@{\letxysetup@@=\xysetup@dummy xyuncatcodes}\fi

```

Similarly, the following provides a place to insert ‘trailing messages’ if the format supports it; otherwise it just throws away the argument (useful for repeating the most important warnings).

```

154 \xywarnifdefinedxyclosedown@@
156 \ifx\AtEndDocument\undefined \letxyclosedown@@=\eat@
157 \else \defxyclosedown@@#1{\AtEndDocument{#1}}\fi

```

This may be useful to hook into specialised mechanisms for including `\special` material on the page.

```

164 \xylet@xy@begindvi=\literal@

```

For example, L^AT_EX 2_ε (post Dec ’94) defines an `\AtBeginDvi` macro to allow zero-sized material to be placed at the beginning of each shipped-out page. Among other uses, this allows such material not to be discarded, when on a page containing only floats. This is used by X_Y-pic in connection with the POSTSCRIPT header dictionary `xyps-ps.doc`.

```

174 \ifx\undefined\AtBeginDvi\else
175 \AtBeginDocument{\letxy@begindvi=\AtBeginDvi}
176 \AtBeginDvi{\global\letxy@begindvi=\literal@}\fi

```

Shared scratch registers: Everything else in this file is also done by $\mathcal{A}\mathcal{M}\mathcal{S}$ -T_EX so we exit here when using that format after renaming their `\toks@@` to `\toks@ii...`

```

186 \ifx\amstexloaded@relax
187 \xylet@toks@ii=\toks@@ \endinput \fi

```

Thus the job of allocating scratch registers is simple except for counters where we only have one so we use L^AT_EX scratch counters when available and otherwise allocate two new ones:

```

195 \ifx\@tempcnta\undefined
196 \xynew@{count}\count@@
197 \xynew@{count}\count@@@
198 \else

```

```

199 \xylet@\count@@=\@tempcnta
200 \xylet@\count@@@=\@tempcntb
201 \fi

```

Finally the second scratch token register not available with L^AT_EX.

```

207 \ifx\undefined\toks@ii \toksdef\toks@ii=2 \fi

```

End & log: That's all.

```

215 \endinput

```

xy.sty: If you use L^AT_EX then this file makes it possible to load X_y-pic as a ‘package’ using the L^AT_EX 2_ε [10] `\usepackage` command:

```
\usepackage [(option),...] {xy}
```

where the `<option>`s will be interpreted as if passed to `\xyoption` (*cf.* §1.7).

The only exceptions to this are the options having the same names as those driver package options of chapter 4, which appear in *cf.* [4, table 11.2, p.317] or the L^AT_EX 2_ε `graphics` bundle. These will automatically invoke any backend extension required to best emulate the L^AT_EX 2_ε behaviour. (This means that, *e.g.*, `[dvips]` and `[textures]` can be used as options to the `\documentclass` command, with the normal effect.)

The file also works as a L^AT_EX 2.09 [9] ‘style option’ although you will then have to load options with the `\xyoption` mechanism described in §1.7.

Here is the raw source of `xy.sty`.

1.1.2 Logo, version, and messages

Loading `Xy-pic` prints a banner containing the version and author of the kernel; small progress messages are printed when each major division of the kernel has been loaded. Any options loaded will announce themselves in a similar fashion.

Of these, `\stripRCS` is a very useful hack for extracting the first component of an RCS `$...$` keyword value.

```

411 \xydef@\stripRCS$#1${\stripRCS@#1: @@ @@@}
412 \xydef@\stripRCS@#1: #2@ #3@@@{%
413 \ifx @#2\string?\else\ifx :#2\else\stripRCS@@#2\fi\fi}
414 \xydef@\stripRCS@@#1 #2: @{#1}
416 \xydef@\xyversion{3.8.5}
418 \edef\next{\stripRCS$Date: 2011/02/11 04:16:21 $}
419 \xylet@\xydate=\next
421 \xydef@\Xygreet@{%
422 \W@{}%

426 \W@{}}
427 \Xygreet@
428 \expandafter\everyjob\expandafter{\the\everyjob\Xygreet@}
430 \message{Loading kernel:}

```

If you refer to `Xy-pic` in your written text (please do ☺) then you can use the command `\Xy-pic` to typeset the “`Xy-pic`” logo. The version of the kernel is typeset by `\xyversion` and the release date by `\xydate` (as found in the banner). By the way, the `Xy-pic` *name*³ originates from the fact that the first version was little more than support for (x, y) coordinates in a configurable coordinate system where the main idea was that *all* operations could be specified in a manner independent of the orientation of the coordinates. This property has been maintained except that now the package allows explicit absolute orientation as well.

```

449 \xydef@\Xy@{\leavevmode
450 \hbox{\kern-.1em X\kern-.3em\lower.4ex\hbox{Y\kern-.15em}}}}

```

1.1.3 Fonts

The Xy-pic kernel implementation makes its drawings using five specially designed fonts:

Font	Characters	Default
<code>\xydashfont</code>	dashes	<code>xydash10</code>
<code>\xyatipfont</code>	arrow tips, upper half	<code>xyatip10</code>
<code>\xybtipfont</code>	arrow tips, lower half	<code>xybtip10</code>
<code>\xybsqlfont</code>	quarter circles for hooks and squiggles	<code>xybsql10</code>
<code>\xycircfont</code>	1/8 circle segments	<code>xycirc10</code>

The first four contain variations of characters in a large number of directions, the last contains 1/8 circle segments.

Note: The default fonts are not part of the Xy-pic kernel *specification*: they just set a standard for what drawing capabilities should at least be required by an Xy-pic implementation. Implementations exploiting capabilities of particular output devices are in use. Hence the fonts are only loaded by Xy-pic if the control sequence names are undefined—this is used to preload them at different sizes or prevent them from being loaded at all.

To be more precise, Xy-pic requires `\xydashfont` to be a *semidirectional* font as METAFONT will generate with the driver file `xyd2.mf`—this is very important because the *italic corrections* of the

characters in this particular font are used to approximate trigonometric computations, so if you replace `\xydashfont` be sure to replace it with another semidirectional font! Similarly, the three fonts `\xyatipfont`, `\xybtipfont`, and `\xybsqlfont` should be *directional* as METAFONT will generate with the driver file `xyd.mf`.

Finally, `\xycircfont` should contain 1/8 circle segments of various radii as described in `xycirc10.mf`.

The following code loads the fonts *unless it was already loaded* and defines some associated dimensions for `\xydashfont` and `\xybsqlfont`: for each of these f we define f_ℓ as the length of a unit in the current direction (used when juxtaposing for connections), f_h as the height of the unit (used for several parallel connections), and f_w as the ‘line width’ of the unit (to know how to interface to rules).

```

```

1.1.4 Allocations

One final thing that you must be aware of is that $\mathbb{X}\mathbb{Y}$ -pic allocates a significant number of dimension registers and some counters, token registers, and box registers, in order to represent the state and do computations. The current kernel allocates 4 counters, 28 dimensions, 2 box registers, 4 token registers, 1 read channel, and 1 write channel (when running under \LaTeX ; some other formats use slightly more because standard generic temporaries are used). Options may allocate further registers (currently loading *everything* loads 6 dimen-, 3 toks-, 1 box-, and 9 count-registers in addition to the kernel ones).

```

598 \message{allocations:}

```

See §1.1.1 for scratch register allocations.

Picture state: These realise the picture state as described in §1.2.5: c , p , the *base*, and the picture size:

```

```
689 \xywarnifdefined\SemiDirectionChar
```

Miscellaneous: Finally some generic allocations used in the following:

```
697 \xynew@{read}\xyread@           % for 'safe input'
698 \xynew@{write}\xywrite@        % for 'saving' to .xyc file
700 \xynew@{count}\csp@           % for 'control stack pointer'
701 \xynew@{dimen}\quotPTK@       % for 'fractions'
```

The required temporaries are defined by `xyidioms.tex`.

1.1.5 Utility macros

Finally we define some utility macros.

```
715 \message{utility macros;}
```

Simple queue: Just appending to the `\toks @` list.

```
724 \xydef@{adddtotoks@#1}{\toks@=\expandafter{\the\toks@#1}}
```

Safe input: Check that file is available before input. Tries the alternate extension `.doc` in case the `.tex` file is not there. The second is the lowest level function used when the desired files cannot be preloaded and do not exist in `.doc` form.

```
735 \xydef@{xyinputorelse@#1#2}{%
736 \expandafter\let\expandafter\next@\csname#1loaded\endcsname
737 \ifx\next@\empty \else
738 \DN@{\xyinputorelse@@{#1}{\xyinputorelse@@{#1.doc}{#2}}}%
739 \fi \next@}

741 \xydef@{xyinputorelse@@#1#2}{\openin\xyread@=#1 %
742 \ifeof\xyread@ \DN@{#2}\else \DN@{\closein\xyread@\input#1 }\fi \next@}
```

Continuation stack: This is used to ‘enter’ a new context and ‘leave’ to the previous context. It works as a stack defining a control sequence for each level, thus using a counter as the stack pointer. Defines the following

<code>\csp@</code>	‘Continuation Stack Pointer’
<code>\enter@{<code>}</code>	Enter new block with <code><code></code> expanded as continuation
<code>\nter@{<code>}</code>	Enter new block with <code><code></code> as continuation
<code>\dontleave@</code>	Execute continuation without leaving block
<code>\unenter@</code>	Leave block without executing its continuation
<code>\leave@</code>	Leave block (execute its continuation)

So `\enter@{ }\leave@` is a noop and `\leave@` is the same as `\dontleave@\unenter@`.

```
765 \global\csp@=\z@
767 \xydef@{enter@#1}{\global\advance\csp@\@ne
768 \expandafter\xdef\csname cs@\number\csp@\endcsname{#1}\ignorespaces}
770 \xydef@{nter@#1}{\global\advance\csp@\@ne
```

```

771 \expandafter\gdef\csname cs@\number\csp@\endcsname{#1}\ignorespaces}
773 \xydef@dontleave@{\csname cs@\number\csp@\endcsname}
775 \xydef@unenter@{\global\advance\csp@m@ne}
777 \xydef@leave@{\expandafter\unenter@\csname cs@\number\csp@\endcsname}

```

Fractions: Below we often use a factor on the form of a quotient A/B . Here is a hack to get it; it is not very precise but suffices for our needs.

```

\quotient@ <cs> {A} {B}  Defines <cs> to expand (immediately) to the factor
                        corresponding to  $A/B$ ;  $A, B$  must be dimensions
                        where  $|A| < \maxdimen/KK$  and  $|B| > KK$ 
\quotient@@ <cs> {A} {B} Same, but uses  $8KK$  for  $KK$ .

```

Notes: (1) If \c is a count register, then $\{1\c\}$ is a legal dimension. (2) Really computes

$$((A \times |KK|)/(B/|KK|)) \times (1\text{pt}/|K|)$$

and then defines $\langle cs \rangle$ to expand to the resulting pt value. This means that results are only reasonable for $|A| \ll \maxdimen/KK$ and $|B| \gg KK$.

```

807 \quotPTK@=\p@ \divide\quotPTK@\K@
808 \xylet@\quotsign@@=\empty
809 \xywarnifdefined\removePT@
810 {\catcode'p=12 \catcode't=12 \gdef\removePT@#1pt{#1}}
812 \xydef@quotient@#1#2#3{\A@=#2\relax \B@=#3\relax
813 \ifdim\A@<\z@\def\quotsign@@{-}\else\def\quotsign@@{+}\fi
814 \ifdim\quotsign@@\A@<15pt \multiply\A@\K@
815 \else\ifdim\quotsign@@\A@<511pt \multiply\A@\KK@
816 \advance\B@\ifdim\B@<\z@-\fi 16sp \divide\B@\KK@
817 \else
818 \advance\B@\ifdim\B@<\z@-\fi 512sp \divide\B@\K@
819 \fi\fi
820 \ifdim\ifdim\B@<\z@-\fi\B@<\quotPTK@ \xywarning@{division overflow}%
821 \else \advance\A@.5\B@ \divide\A@\B@ \fi
822 \multiply\A@\quotPTK@ \edef#1{\expandafter\removePT@\the\A@}}
824 \xydef@quotient@@#1#2#3{\A@=#2\relax \B@=#3\relax \multiply\A@\KK@
825 \advance\B@\ifdim\B@<\z@-\fi 128sp \divide\B@\KK@ \divide\B@ 8 %
826 \ifdim\B@=\z@\else \advance\A@.5\B@ \divide\A@\B@ \fi
827 \B@=.125\quotPTK@ \multiply\A@\B@ \edef#1{\expandafter\removePT@\the\A@}}

```

Loops: Xy-pic uses its own $\loop@$ to avoid interference with plain \loop .

```

836 \xydef@loop@#1\repeat@{\def\body@{#1}\iterate@}\xylet@\repeat@=\fi
837 \xydef@iterate@{\body@\expandafter\iterate@\else\fi}

```

Execution: All execution of Xy-commands should be ‘indirect’, *i.e.*, execute

$$\xy@{\langle source \rangle}\{\langle internal commands \rangle\}$$

where the \langle internal commands \rangle directly do the desired operation(s). This is used for tracing and can be used to separate parsing and execution by changing $\backslash xy@$; $\backslash oxy@$ is kept stable such that $\backslash let\backslash xy@=\backslash oxy@$ will reestablish a sane state; it should only be changed with $\backslash change@oxy@$ to make this easy to verify.

```

854 \xydef\xyinitial@#1#2{\DN@{#1}%
855 \xyerror@{command used out of context: \codeof\next@}{}}
857 \xylet\xy@=\xyinitial@
858 \xylet\oxy@=\xy@
860 \xydef\change@oxy@#1{\let\oxy@=#1\relax
861 % \W@{*OXY@:=\meaning\oxy@}%
862 }
```

This is also used to check whether an $\mathbb{X}\mathbb{Y}$ -picture is already active; use as $\backslash if\backslash inxy@ \dots \backslash else \dots \backslash fi$:

```

869 \xydef\inxy@{\T\ifx\xy@\xyinitial@ F\else T\fi}
```

The final execution command is a trick used to put bits of the user's input inside the $\backslash next@$ scratch macro *with the user's catcodes intact*: $\backslash xy@@ix@{\dots}$ is the same as $\backslash xy@@{\global\toks9={\dots}}$ except for the category codes used for the \dots .

```

879 \xydef\xyxy@@ix@{\begingroup
880 \xyuncatcodes\afterassignment\endgroup\global\toks9=}
```

This to save some tokens – maybe not worth it:

```

886 \xydef\xy@@{\xy@{}}
```

Finally this to establish a sane state – only use within a group!

```

892 \xydef\plainxy@{\let\xy@=\xyxy@ \change@oxy@\xy@ \let\xy@@ix@=\xyxy@@ix@}
```

To Do: Clean up all uses of these such that \langle source \rangle is always that and only that. Define a method for ‘inner’ *aka* ‘implied’ \langle source \rangle that doesn't really count in that it is a consequence of some other source...

1.2 Picture basics

The basic concepts involved when constructing $\mathbb{X}\mathbb{Y}$ -pictures are positions and objects, and how they combine to form the state used by the graphic engine.

The general structure of an $\mathbb{X}\mathbb{Y}$ -picture is as follows:

$$\backslash xy \langle pos \rangle \langle decor \rangle \backslash endxy$$

builds a box with an $\mathbb{X}\mathbb{Y}$ -picture (L^AT_EX users may substitute $\backslash begin\{xy\} \dots \backslash end\{xy\}$ if they prefer).

$\langle pos \rangle$ and $\langle decor \rangle$ are components of the special ‘graphic language’ which $\mathbb{X}\mathbb{Y}$ -pictures are specified in. We explain the language components in general terms in this § and in more depth in the following §§.

The code for the $\backslash xy \dots \backslash endxy$ command is presented last in this section.

1.2.1 Positions

All *positions* may be written $\langle X, Y \rangle$ where X is the T_EX dimension distance *right* and Y the distance *up* from the *zero position* 0 of the $\mathbb{X}\mathbb{Y}$ -picture (0 has coordinates $\langle 0mm, 0mm \rangle$, of course). The zero position of the $\mathbb{X}\mathbb{Y}$ -picture determines the box produced by the $\backslash xy \dots \backslash endxy$ command together with

the four parameters X_{\min} , X_{\max} , Y_{\min} , and Y_{\max} set such that all the objects in the picture are ‘contained’ in the following rectangle:

where the distances follow the “up and right > 0” principle, *e.g.*, the indicated TeX reference point has coordinates $\langle X_{\min}, 0\text{pt} \rangle$ within the XY -picture. The zero position does not have to be contained in the picture, but $X_{\min} \leq X_{\max} \wedge Y_{\min} \leq Y_{\max}$ always holds. The possible positions are described in detail in §1.3.

When an XY -picture is entered in *math mode* then the reference point becomes the “vcenter” instead, *i.e.*, we use the point $\langle X_{\min}, -\text{\the\fontdimen22} \rangle$ as reference point.

1.2.2 Objects

The simplest form of putting things into the picture is to ‘drop’ an *object* at a position. An object is like a TeX box except that it has a general *Edge* around its reference point—in particular this has the *extents* (*i.e.*, it is always contained within) the dimensions L , R , U , and D away from the reference point in each of the four directions left, right, up, and down. Objects are encoded in TeX boxes using the convention that the TeX reference point of an object is at its left edge, thus shifted $\langle -L, 0\text{pt} \rangle$ from the center—so a TeX box may be said to be a rectangular object with $L = 0\text{pt}$. Here is an example:

The object shown has a rectangle edge but others are available even though the kernel only supports rectangle and circle edges. It is also possible to use entire XY -pictures as objects with a rectangle edge, 0 as the reference point, $L = -X_{\min}$, $R = X_{\max}$, $D = -Y_{\min}$, and $U = Y_{\max}$. The commands for objects are described in §1.4.

1.2.3 Connections

Besides having the ability to be dropped at a position in a picture, all objects may be used to *connect* the two current objects of the state, *i.e.*, p and c . For most objects this is done by ‘filling’ the straight line between the centers with as many copies as will fit between the objects:

The ways the various objects connect are described along with the objects.

1.2.4 Decorations

When the $\backslash\text{xy}$ command reaches something that can not be interpreted as a continuation of the position being read, then it is expected to be a *decoration*, *i.e.*, in a restricted set of TeX commands which add to pictures. Most such commands are provided by the various *user options* (*cf.* §1.7)—only

a few are provided within the kernel to facilitate programming of such options (and user macros) as described in §1.5.

1.2.5 The \Xy-pic state

Finally we summarise the user-accessible parts of the \Xy-pic picture state of two positions together with the last object associated with each: the *previous*, p , is the position $\langle X_p, Y_p \rangle$ with the object $L_p, R_p, D_p, U_p, Edge_p$, and the *current*, c , is the position $\langle X_c, Y_c \rangle$ with the object $L_c, R_c, D_c, U_c, Edge_c$.

Furthermore, \Xy-pic has a configurable *cartesian coordinate system* described by an *origin* position $\langle X_{origin}, Y_{origin} \rangle$ and two *base vectors* $\langle X_{xbase}, Y_{xbase} \rangle$ and $\langle X_{ybase}, Y_{ybase} \rangle$ accessed by the usual notation using parentheses:

$$(x, y) = \langle X_{origin} + x \times X_{xbase} + y \times X_{ybase} \quad , \\ Y_{origin} + x \times Y_{xbase} + y \times Y_{ybase} \quad \rangle$$

This is explained in full when we show how to set the base in note 1.3d of §1.3.

Finally typesetting a connection will setup a “placement state” for referring to positions on the connection that is accessed through a special ? position construction; this is also discussed in detail in §1.3.

The \Xy-pic *state* consists of all these parameters together. They are initialised to zero except for $X_{xbase} = Y_{ybase} = 1\text{mm}$.

The edges are available to the programmer as token lists; see §1.8.2 for details.

Procedure: `\xy ... \endxy` builds an object from an \Xy-pic $\langle \text{pos} \rangle \langle \text{decor} \rangle$ sequence as follows: (1.1114) `\xy` starts the `\hbox` to contain the \Xy-pic picture, (1.1115) starts an inner box to be resized appropriately later, sets `\xy@` to just execute immediately, and makes a fresh scope for global internal names, and (1.1117) initialises the \Xy-pic state (setting the size to a ridiculously large negative value), and finally passes control to the $\langle \text{pos} \rangle$ parser.

Some care is taken to ‘lift’ the diagram a bit to ‘vcenter’ it when in math mode, and `\mathsurround` is set to zero to make changes into math mode safe.

```

1107 \message{pictures: \string\xy,}
1109 \xydef@{\xy{\ifmmode\expandafter\xymath@else\expandafter\xynomath@\fi}

1130 \xylet@\everyxy@=\empty

```

When finished `\endxy` does a `\relax` to disable any parser still active and (1.1144) resets the size of the generated box to zero if no (unhidden) objects were inserted, and (1.1148) defines a command to end both the temporary and the ‘proper’ box and set its size correctly—this uses `\edef` to expand the required dimensions used within the temporary box before leaving the two groups (namely the temporary box and the ‘proper’ box).

```

```

If an `\xy` is not properly closed by an `\endxy` then the error message is produced. This happens if (a) too many `\xys` or (b) too many `\endxys` or (c) if there is the correct number of each but the grouping becomes unbalanced due to a misplaced `}` or `\egroup`.

```

1165 \xydef\xycheck@end{\xyFN@\xycheck@end@}
1166 \xydef\xycheck@end@{\ifx\next\xy@end\DN@\xy@end@\else\DN@\xy@end@\fi\next@}
1167 \xydef\xy@end@{%
1168 \xyerror@{An \string\xy\space environment is not closed correctly.}%
1169 {I expected \string\endxy. You probably have an unmatched {} grouping.}}

```

It is possible to insert an ‘initial’ piece of `<pos>` `<decor>` at the start of every `Xy`-picture with the declaration

```
\everyxy={ <text> }
```

This will act as if the `<text>` was typed literally right after each `\xy` command, parsing the actual contents as if it follows this – thus it is recommended that `<text>` has the form `<pos>`, such that users can continue with `<pos>` `<decor>`.

1.3 Positions

```
1195 \message{positions,}
```

A `<pos>`ition is a way of specifying locations as well as dropping objects at them and decorating them—in fact any aspect of the `Xy-pic` state can be changed by a `<pos>` but most will just change the coordinates and/or shape of `c`.

All possible positions are shown in figure 1.1 with explanatory notes below.

Exercise 1.1: Which of the positions `0`, `<0pt,0pt>`, `<0pt>`, `(0,0)`, and `/0pt/` is different from the others? (p.577)

Syntax	Action		
$\langle \text{pos} \rangle$	\rightarrow	$\langle \text{coord} \rangle$	$c \leftarrow \langle \text{coord} \rangle$
		$\langle \text{pos} \rangle + \langle \text{coord} \rangle$	$c \leftarrow \langle \text{pos} \rangle + \langle \text{coord} \rangle^{1.3a}$
		$\langle \text{pos} \rangle - \langle \text{coord} \rangle$	$c \leftarrow \langle \text{pos} \rangle - \langle \text{coord} \rangle^{1.3a}$
		$\langle \text{pos} \rangle ! \langle \text{coord} \rangle$	$c \leftarrow \langle \text{pos} \rangle$ then skew ^{1.3b} c by $\langle \text{coord} \rangle$
		$\langle \text{pos} \rangle . \langle \text{coord} \rangle$	$c \leftarrow \langle \text{pos} \rangle$ but also covering ^{1.3c} $\langle \text{coord} \rangle$
		$\langle \text{pos} \rangle , \langle \text{coord} \rangle$	$c \leftarrow \langle \text{pos} \rangle$ then $c \leftarrow \langle \text{coord} \rangle$
		$\langle \text{pos} \rangle ; \langle \text{coord} \rangle$	$c \leftarrow \langle \text{pos} \rangle$, swap p and c , $c \leftarrow \langle \text{coord} \rangle$
		$\langle \text{pos} \rangle : \langle \text{coord} \rangle$	$c \leftarrow \langle \text{pos} \rangle$, set base ^{1.3d} , $c \leftarrow \langle \text{coord} \rangle$
		$\langle \text{pos} \rangle :: \langle \text{coord} \rangle$	$c \leftarrow \langle \text{pos} \rangle$, $ybase \leftarrow c - origin$, $c \leftarrow \langle \text{coord} \rangle$
		$\langle \text{pos} \rangle * \langle \text{object} \rangle$	$c \leftarrow \langle \text{pos} \rangle$, drop ^{1.3f} $\langle \text{object} \rangle$
		$\langle \text{pos} \rangle ** \langle \text{object} \rangle$	$c \leftarrow \langle \text{pos} \rangle$, connect ^{1.3g} using $\langle \text{object} \rangle$
		$\langle \text{pos} \rangle ? \langle \text{place} \rangle$	$c \leftarrow \langle \text{pos} \rangle$, $c \leftarrow \langle \text{place} \rangle^{1.3h}$
		$\langle \text{pos} \rangle @ \langle \text{stacking} \rangle$	$c \leftarrow \langle \text{pos} \rangle$, do $\langle \text{stacking} \rangle^{1.3o}$
		$\langle \text{pos} \rangle = \langle \text{saving} \rangle$	$c \leftarrow \langle \text{pos} \rangle$, do $\langle \text{saving} \rangle^{1.3p}$
$\langle \text{coord} \rangle$	\rightarrow	$\langle \text{vector} \rangle$	$\langle \text{pos} \rangle$ is $\langle \text{vector} \rangle$ with zero size
		$\langle \text{empty} \rangle$ c	reuse last c (do nothing)
		p	p
		x y	axis intersection ^{1.3k} with \overline{pc}
		$s\langle \text{digit} \rangle$ $s\{\langle \text{number} \rangle\}$	stack ^{1.3o} position $\langle \text{digit} \rangle$ or $\langle \text{number} \rangle$ below the top
		" $\langle \text{id} \rangle$ "	restore what was saved ^{1.3p} as $\langle \text{id} \rangle$ earlier
		{ $\langle \text{pos} \rangle$ $\langle \text{decor} \rangle$ }	the c resulting from interpreting the group ^{1.3l}
$\langle \text{vector} \rangle$	\rightarrow	0	zero
		$\langle \text{dimen} \rangle , \langle \text{dimen} \rangle >$	absolute
		$\langle \text{dimen} \rangle >$	absolute with equal dimensions
		($\langle \text{factor} \rangle , \langle \text{factor} \rangle$)	in current base ^{1.3d}
		a ($\langle \text{number} \rangle$)	angle in current base ^{1.3e}
		$\langle \text{corner} \rangle$	from reference point to $\langle \text{corner} \rangle$ of c
		$\langle \text{corner} \rangle$ ($\langle \text{factor} \rangle$)	The $\langle \text{corner} \rangle$ multiplied with $\langle \text{factor} \rangle$
		/ $\langle \text{direction} \rangle$ $\langle \text{dimen} \rangle$ /	vector $\langle \text{dimen} \rangle$ in $\langle \text{direction} \rangle^{1.3m}$
$\langle \text{corner} \rangle$	\rightarrow	L R D U	offset ^{1.3n} to left, right, down, up side
		CL CR CD CU C	offset ^{1.3n} to center of side, true center
		LD RD LU RU	offset ^{1.3n} to actual left/down, ... corner
		E P	offset ^{1.3n} to nearest/proportional edge point to p
		A	vertical offset ^{1.3n} to math axis
			$\langle 0pt, \backslash \text{fontdimen}22 \backslash \text{textfont}2 \rangle$
$\langle \text{place} \rangle$	\rightarrow	$\langle \text{place} \rangle$ $\langle \text{place} \rangle$	shave ^{1.3h} (0)/(1) to edge of p/c , $f \leftarrow 0/1$
		($\langle \text{factor} \rangle$) $\langle \text{place} \rangle$	$f \leftarrow \langle \text{factor} \rangle$
		$\langle \text{slide} \rangle$	pick place ^{1.3h} and apply $\langle \text{slide} \rangle$
		! { $\langle \text{pos} \rangle$ } $\langle \text{slide} \rangle$	intercept ^{1.3j} with line setup by $\langle \text{pos} \rangle$ and apply $\langle \text{slide} \rangle$
$\langle \text{slide} \rangle$	\rightarrow	/ $\langle \text{dimen} \rangle$ /	slide ^{1.3i} $\langle \text{dimen} \rangle$ further along connection
		$\langle \text{empty} \rangle$	no slide

Figure 1.1: $\langle \text{pos} \rangle$ itions.

Parsing: First the `\POS` and `\afterPOS` <decor>ations, and similar `\afterCOORD` and `\afterVECTORorEMPTY` ones. They handle parsing of <pos>, <coord>, and <vector>; parsing of <corner> and <place> is presented along with note 1.3n and 1.3h explaining them.

```

1371 \xydef@\POS{\afterPOS{}}
1373 \xydef@\afterPOS#1{%
1374 \DN@##1{\def\afterPOS@{\def\afterPOS@{##1}#1}}%
1375 \expandafter\next@\expandafter{\afterPOS@}%
1376 \afterCOORD{\xyFN@\POS@}}
1378 \xylet@\afterPOS@=\empty
1380 \xydef@\afterCOORD#1{%
1381 \DN@##1{\def\afterCOORD@{\def\afterCOORD@{##1}#1}}%
1382 \expandafter\next@\expandafter{\afterCOORD@}%
1383 \afterVECTORorEMPTY{\xy@\czeroEdge@ \afterCOORD@}{\xyFN@\COORD@}}
1385 \xylet@\afterCOORD@=\empty
1387 \xydef@\afterVECTORorEMPTY#1#2{%
1388 \DN@##1{\def\afterVECTOR@{\def\afterVECTOR@{##1}%
1389 \ifVECTORempty@DN@{#2}\else\DN@{#1}\fi \next@}}%
1390 \expandafter\next@\expandafter{\afterVECTOR@}%
1391 \xyFN@\VECTOR@}
1393 \xynew@{if}\ifVECTORempty@
1394 \xylet@\afterVECTOR@=\empty

```

The `\afterVECTORorEMPTY` command is special in that it takes two arguments: the ‘continuation’ if a <vector> was found and the continuation if <empty> was found (this is not applicable to the other two since <empty> is a legal <coord> and thus also a legal <pos>).

Next we proceed with the actual parsing primitives: `\COORD@`, `\POS@`, and `\VECTOR@`. These are bound to `\xyCOORD@`, `\xyPOS@`, and `\xyVECTOR@` in order to be extendable, *e.g.*, the `matrix` option extends <coord> to support the `[row, column]` format by redefining `\COORD@` to first test for this new format and then call `\xyCOORD@`.

The parsing commands above are set up such that they all first call the `\VECTOR@` command. <coord> and <pos> parsing then proceeds with calling the `\COORD@` if there was no <vector>. <pos> parsing then calls `\POS@` to continue the <pos> (in both cases).

First <vector>s:

```

1418 \xydef@\xyVECTOR@{%
1419 \ifx \space@\next \expandafter\DN@\space{\xyFN@\VECTOR@}%gobble spaces
1420 \else \ifcat A\noexpand\next \let\next@=\VECTOR@letter
1421 \else \let\next@=\VECTOR@other \fi\fi \next@}
1423 \xylet@\VECTOR@=\xyVECTOR@

```

All letters used for <vector>s are uppercase <corner>s except for a used for angles (where the main code is in note 1.3e); this is also where we introduce the auxiliary `\notrelaxorlse@` that takes two control sequences and expands the first unless it is `relax` in which case it expands the second:

```

1433 \def\notrelaxorlse@#1#2{\ifx#1\relax \expandafter#2\else\expandafter#1\fi}
1435 \xydef@\VECTOR@letter{%
1436 \ifx a\next \expandafter\VECTOR@a \else \expandafter\CORNER@ \fi}
1438 \xydef@\VECTOR@a a(#1){\xy@{a(#1)}{\vfromcartesianangle@{#1}}%

```

```
1439 \VECTORempty@false \afterVECTOR@}
```

The `<corner>` trick is to do nothing when there is nothing and initialise both X and Y in all other cases.

```
1446 \xydef@<CORNER@{%
1447 \xy@{}{\A@=-.5\L@c \advance\A@.5\R@c \B@=-.5\D@c \advance\B@.5\U@c
1448 \let\nextii@=\zeroit@}%
1449 \VECTORempty@true<CORNER@i}
1451 \xydef@<zeroit@#1{#1=\z@}
1453 \xydef@<CORNER@i{%
1454 \ifx D\next \DN@ D{\xy@{D}}{\Y@c=-\D@c \nextii@\X@c \B@=\Y@c}<CORNER@ii}%
1455 \else\ifx U\next \DN@ U{\xy@{U}}{\Y@c= \U@c \nextii@\X@c \B@=\Y@c}<CORNER@ii}%
1456 \else\ifx A\next \DN@ A{\xy@{A}}{\Y@c=\fontdimen22\textfont\tw@ \nextii@\X@c \B@=\Y@c}<CORNER@ii}
1457 \else\ifx L\next \DN@ L{\xy@{L}}{\X@c=-\L@c \nextii@\Y@c \A@=\X@c}<CORNER@ii}%
1458 \else\ifx R\next \DN@ R{\xy@{R}}{\X@c= \R@c \nextii@\Y@c \A@=\X@c}<CORNER@ii}%
1459 \else\ifx C\next \DN@ C{\xy@{C}}{\X@c= \A@ \Y@c= \B@}<CORNER@ii}%
1460 \else\ifx E\next \DN@ E{\xy@{E}}{%
1461 \A@=\X@c \B@=\Y@c \the\Edge@c\z@ \advance\X@c-\A@ \advance\Y@c-\B@}%
1462 <CORNER@ii}%
1463 \else\ifx P\next \DN@ P{\xy@{P}}{%
1464 \A@=\X@c \B@=\Y@c \the\Edge@c\thr@@ \advance\X@c-\A@ \advance\Y@c-\B@}%
1465 <CORNER@ii}%
1466 \else\ifx (\next %
1467 \DN@(&#1){\xy@{&#1}}{\X@c=&#1\X@c \Y@c=&#1\Y@c}<afterVECTOR@}%
1468 \else \let\next@=<afterVECTOR@
1469 \fi\fi\fi\fi\fi\fi\fi\fi \next@}
1471 \xydef@<CORNER@ii{\xy@@{\let\nextii@=\eat@}%
1472 \VECTORempty@false \xyFN@<CORNER@i}
```

`<CORNER@i` recognises the `<<factor>>` also; this does no harm as it was never called if the first character was a `(`.

The remaining `<vector>` forms just set X and Y .

```
1481 \xydef@<VECTOR@other{%
1482 \addLT@\ifx \next
1483 \addGT@{\addLT@\DN@&#1}{\xy@{<&#1>}{\vfromabsolute@&#1}}%
1484 \VECTORempty@false<afterVECTOR@}%
1485 \else\ifx (\next %
1486 \DN@({\xyFN@<VECTOR@other@open})%
1487 \else\ifx /\next %/
1488 \DN@&#1/{\xy@@ix@{&#1}}%
1489 \xy@{&#1/}{\expandafter\vfromslide@the\toks9 }%
1490 \VECTORempty@false<afterVECTOR@}%
1491 \else\ifx 0\next
1492 \DN@ 0{\xy@{0}}{\X@c=\z@ \Y@c=\z@}<VECTORempty@false<afterVECTOR@}%
1493 \else
1494 \DN@{<VECTORempty@true<afterVECTOR@}%
1495 \fi\fi\fi\fi \next@}
```

Hack: escape out in case of the special `(*` introducer... picked up by the `<coord>` parser, then.

```

1502 \xydef@\VECTOR@other@open{%
1503 \ifx *\next \DN@\VECTORempty@true \xyFN@\afterVECTOR@}%
1504 \else
1505 \DN@##1{\xy@{##1}}{\vfromcartesian@{##1}}\VECTORempty@false\afterVECTOR@}%
1506 \fi \next@}

```

Next \langle coord \rangle inates that are not \langle vector \rangle s:

```

1512 \xydef@\xyCOORD@{%
1513 \ifx \space@\next \expandafter\DN@\space{\xyFN@\COORD@}%gobble spaces
1514 \else \ifcat A\noexpand\next \let\next@=\xyCOORD@letter
1515 \else \let\next@=\xyCOORD@other \fi\fi \next@}
1517 \xylet@\COORD@=\xyCOORD@
1519 \xydef@\xyCOORD@letter{%
1520 \ifx c\next
1521 \DN@ c{\xy@{c}}{\afterCOORD@}%
1522 \else\ifx p\next
1523 \DN@ p{\xy@{p}}\cfromp@ \afterCOORD@}%
1524 \else\ifx x\next
1525 \DN@ x{\xy@{x}}{\R@=\X@xbase \U@=\Y@xbase \intersect@}\afterCOORD@}%
1526 \else\ifx y\next
1527 \DN@ y{\xy@{y}}{\R@=\X@ybase \U@=\Y@ybase \intersect@}\afterCOORD@}%
1528 \else\ifx s\next
1529 \DN@ s##1{\xy@{s{##1}}}\cfroms@{##1}\afterCOORD@}%
1530 \else \let\next@=\afterCOORD@ \fi\fi\fi\fi \next@}
1532 \xydef@\xyCOORD@other{%
1533 \ifx "\next %"
1534 \DN@"##1"{\xy@"##1"}{\cfromid@{##1}}\afterCOORD@}%
1535 \else\ifx \bgroup\next
1536 \DN@##1{\xy@{##1}}{\enter@{\pfromthep@basefromthebase@}}%
1537 \silencexy@ \POS##1\relax \unsilencexy@ \xy@@\leave@ \afterCOORD@}%
1538 \else\ifx (\next %)
1539 \DN@({\xyFN@\xyCOORD@other@open}%)
1540 \else \let\next@=\afterCOORD@ \fi\fi\fi \next@}
1542 \xynew@{if}\ifsilentxy@
1544 \xydef@\silencexy@{%
1545 \ifsilentxy@ \nter@{}}%
1546 \else \nter@{\silentxy@false \let\xy@=\unsilent@xy@}
1547 \silencexy@true \let\unsilent@xy@=\xy@ \def\xy@##1##2{\unsilent@xy@{##2}}%
1548 \fi}
1550 \xydef@\unsilencexy@{\leave@}
1552 \xydef@\xyCOORD@other@open{%
1553 \ifx *\next
1554 \DN@*##1*{\xy@{*}}{\enter@{\pfromthep@basefromthebase@}}%
1555 \POS##1\relax \xy@{*}}\leave@ \afterCOORD@}%
1556 \else \DN@{\xyFN@\afterCOORD@}%
1557 \fi \next@}

```

Finally \langle pos \rangle parsing after \langle coord \rangle (possibly \langle vector \rangle) is interpreted:

```

1564 \xydef@\xyPOS@{%
1565 \ifx \space@\next \expandafter\DN@\space{\xyFN@\POS@}%gobble spaces
1566 \else\addPLUS@\ifx \next
1567 \addPLUS@\DN@{\xy@+\enter@\cplusthec}%
1568 \afterCOORD{\xy@\leave@ \xyFN@\POS@}}%
1569 \else\addDASH@\ifx \next
1570 \addDASH@\DN@{\xy@-\enter@\cplusthec}%
1571 \afterCOORD{\xy@\X@c=-\X@c \Y@c=-\Y@c\leave@}\xyFN@\POS@}}%
1572 \else\ifx !\next
1573 \DN@ !{\xy@!\enter@\c skewthec}\afterCOORD{\xy@\leave@ \xyFN@\POS@}}%
1574 \else\addDOT@\ifx \next
1575 \addDOT@\DN@{\xy@.\enter@\cmergethec}%
1576 \afterCOORD{\xy@\leave@ \xyFN@\POS@}}%
1577 \else\ifx ,\next
1578 \DN@ ,{\xy@,{\comma@@}\afterCOORD{\xyFN@\POS@}}%
1579 \else\ifx ;\next
1580 \DN@ ;{\xy@;{\swap@}\afterCOORD{\xyFN@\POS@}}%
1581 \else\ifx : \next
1582 \DN@ :{\xyFN@\POS@colon}%
1583 \else\addEQ@\ifx \next
1584 \addEQ@\DN@{\xyFN@\saveid}%
1585 \else\ifx *\next
1586 \DN@ *{\xyFN@\POS@star}%
1587 \else \ifx ?\next
1588 \DN@?{\xy@?}\afterPLACE{\xyFN@\POS@}}%
1589 \else \addAT@\ifx \next
1590 \addAT@\DN@{\xyFN@\STACK@}%
1591 \else
1592 \let\next@=\afterPOS@
1593 \fi\fi\fi\fi\fi\fi\fi\fi\fi\fi\fi \next@}
1595 \xylet@\comma@@=\relax
1597 \xylet@\POS@=\xyPOS@

```

\comma@@ is a hook used to change the operation of , *e.g.*, when reading a stack setup where it means ‘push’.

The final functions serve only to distinguish between the single character :/* and dual character :/** operators:

```

1607 \xydef@\POS@colon{\DNii@{\afterCOORD{\xyFN@\POS@}}%
1608 \ifx : \next \xy@{:}\setbase@\X@c\Y@c\DN@:{\nextii}%
1609 \else \xy@:{\setbase@\X@p\Y@p\X@c\Y@c}\let\next@=\nextii@ \fi
1610 \next@}
1612 \xydef@\POS@star{%
1613 \ifx *\next
1614 \DN@###1##{\nextii@{##1}}%
1615 \DNii@##1##2{\xy@ix@{##1}{##2}}%
1616 \xy@{**##1{##2}}{\expandafter\connect@the\toks9 }\xyFN@\POS@}%
1617 \else
1618 \DN@##1##{\nextii@{##1}}%
1619 \DNii@##1##2{\xy@ix@{##1}{##2}}%

```

```

1620 \xy@{*##1{##2}}{\expandafter\drop@the\toks9 }\xyFN@POS}%
1621 \fi
1622 \next@}

```

Simple actions: Next follow the simplest actions; the complicated ones are explained along with their notes below.

```

1633 \xydef@cfromp@{\Xc=\Xp \Yc=\Yp \Uc=\Up \Dc=\Dp \Lc=\Lp \Rc=\Rp
1634 \Edgec=\expandafter{\the\Edgep}}
1636 \xydef@pfromc@{\Xp=\Xc \Yp=\Yc \Up=\Uc \Dp=\Dc \Lp=\Lc \Rp=\Rc
1637 \Edgep=\expandafter{\the\Edgec}}
1639 \xydef@swapdimen@#1#2{\dimen=#1\relax #1=#2\relax #2=\dimen@}
1641 \xynew@{toks}\swaptoks@@
1643 \xydef@swap@{\swapdimen@Xc\Xp \swapdimen@Yc\Yp
1644 \swapdimen@Uc\Up \swapdimen@Dc\Dp \swapdimen@Lc\Lp \swapdimen@Rc\Rp
1645 \swaptoks@@=\Edgec \Edgec=\Edgep \Edgep=\swaptoks@@}

```

Next the parsing of coordinate pairs in $\langle \rangle$:

```

1651 \xydef@vfromabsolute@#1{\vfromabsolute@@#1,@}
1653 \xydef@vfromabsolute@@#1,#2@{\Xc=#1\relax
1654 \DN@{#2}\ifx\next@empty \Yc=\Xc
1655 \else \DN@##1,{\Yc=##1}\next@#2\relax \fi
1656 % \advance\Xc 1sp \advance\Yc 1sp %HACK
1657 }

```

The next group of commands are used to store on the control stack with the `\enter@` command, so they *expand* to something useful:

```

1664 \xydef@cfromthec@{\Xc=\the\Xc \Yc=\the\Yc
1665 \Uc=\the\Uc \Dc=\the\Dc \Lc=\the\Lc \Rc=\the\Rc
1666 \Edgec={\expandafter\noexpand\the\Edgec}}
1668 \xydef@cfromthep@{\Xc=\the\Xp \Yc=\the\Yp
1669 \Uc=\the\Up \Dc=\the\Dp \Lc=\the\Lp \Rc=\the\Rp
1670 \Edgec={\expandafter\noexpand\the\Edgep}}
1672 \xydef@pfromthep@{\Xp=\the\Xp \Yp=\the\Yp
1673 \Up=\the\Up \Dp=\the\Dp \Lp=\the\Lp \Rp=\the\Rp
1674 \Edgep={\expandafter\noexpand\the\Edgep}}
1676 \xydef@pfromthec@{\Xp=\the\Xc \Yp=\the\Yc
1677 \Up=\the\Uc \Dp=\the\Dc \Lp=\the\Lc \Rp=\the\Rc
1678 \Edgep={\expandafter\noexpand\the\Edgec}}

```

Notes

1.3a. When doing arithmetic with $+$ and $-$ then the resulting current object inherits the size of the $\langle \text{coord} \rangle$, *i.e.*, the right argument—this will be zero if the $\langle \text{coord} \rangle$ is a $\langle \text{vector} \rangle$.

Exercise 1.2: How do you set c to an object the same size as the saved object "ob" but moved $\langle X, Y \rangle$? (p.577)

```
1698 \xydef@cplusthec@{\advance\X@c\the\X@c \advance\Y@c\the\Y@c}
```

1.3b. *Skewing* using ! just means that the reference point of c is moved with as little change to the shape of the object as possible, *i.e.*, the edge of c will remain in the same location except that it will grow larger to avoid moving the reference point outside c .

Exercise 1.3: What does the $\langle \text{pos} \rangle \dots !R-L$ do? (p.577) **Bug:** The result of ! is always a rectangle currently.

Procedure: ! moves the center of c by a temporarily read c' and then readjusts the extents:

$$\begin{aligned} D_c &:= Y' + Y_c - \min(Y' - D', Y' + Y_c) &= \max(Y_c + D', 0) \\ U_c &:= \max(Y' + U', Y' + Y_c) - (Y' + Y_c) &= \max(U' - Y_c, 0) \\ Y_c &:= Y' + Y_c \\ L_c &:= X' + X_c - \min(X' - L', X' + X_c) &= \max(X_c + L', 0) \\ R_c &:= \max(X' + R', X' + X_c) - (X' + X_c) &= \max(R' - X_c, 0) \\ X_c &:= X' + X_c \end{aligned}$$

```
1741 \xydef@cskewthec@{%
1742 \noexpand\skew@{\the\Y@c}{\the\X@c}{\the\D@c}{\the\U@c}{\the\L@c}{\the\R@c}}

1.3c. A $\langle \text{pos} \rangle$ *covers* another if it is a rectangle with size sufficiently large that the other is “underneath”. The . operation “extends” a $\langle \text{pos} \rangle$ to cover an additional one—the reference point of c is not moved but the shape is changed to a rectangle such that the entire p object is covered.

Bug: non-rectangular objects are first “translated” into a rectangle by using a diagonal through the object as the diagonal of the rectangle.

Procedure: . takes a temporary object c' and adjusts the extents of c such that it is covered.

$$\begin{aligned} L_c &:= X' - \min(X' - L_c, X - L) &= \max(L_c, A + L) \\ R_c &:= \max(X' + R_c, X + R) - X' &= \max(R_c, -A + R) \\ D_c &:= Y' - \min(Y' - D_c, Y - D) &= \max(D_c, B + D) \\ U_c &:= \max(Y' + U_c, Y + U) - Y' &= \max(U_c, -B + U) \end{aligned}$$

with $\langle A, B \rangle = \langle X' - X, Y' - Y \rangle$. First method 2 of the object is used to convert it into a rectangle.

```

```

1.3d. The operations `:` and `::` set the *base* used for `<coord>`inates having the form (x,y) . The `:` operation will set $\langle X_{origin}, Y_{origin} \rangle$ to p , $\langle X_{xbase}, Y_{xbase} \rangle$ to $c - origin$, and $\langle X_{ybase}, Y_{ybase} \rangle$ to $\langle -Y_{xbase}, X_{xbase} \rangle$ (this ensures that it is a usual square coordinate system). The `::` operation may then be used afterwards to make nonsqare bases by just setting *ybase* to $c - origin$. Here are two examples: firstly `0;<1cm,0cm>:` sets the coordinate system

while `<1cm, .5cm>;<2cm,1.5cm>:<1cm,1cm>::` defines

where in each case the `o` is at 0, the base vectors have been drawn and the `x` is at $(1,1)$.

When working with cartesian coordinates these three special `<factor>`s are particularly useful:

<code>\halfroottwo</code>	$0.70710678 \approx \frac{1}{2}\sqrt{2}$
<code>\partroottwo</code>	$0.29289322 \approx 1 - \frac{1}{2}\sqrt{2}$
<code>\halfrootthree</code>	$0.86602540 \approx \frac{1}{2}\sqrt{3}$

More can be defined using `\def` (or `\newcommand` in L^AT_EX).

```

1853 \xydef@{\halfroottwo{.70710678}
1854 \xydef@{\partroottwo{.29289322}
1855 \xydef@{\halfrootthree{.8660254}

Procedure: The code chosen by the parsing is very simple; the only tricky bit is to ensure that
\basefromthebase@ always expands to set the current base.

1.3e. An *angle* α in Xy-pic is the same as the coordinate pair $(\cos \alpha, \sin \alpha)$ where α must be an integer interpreted as a number of degrees. Thus the \langle vector \rangle $\mathbf{a}(0)$ is the same as $(1,0)$ and $\mathbf{a}(90)$ as $(0,1)$, etc.

The translation involves several steps: (1.1960) Normalise the argument to be within $[0^\circ : 360^\circ]$. (1.1963) Flip angle around x -axis and then y -axis to ensure it is in the first quadrant, *i.e.*, within $[0^\circ : 90^\circ]$. (1.1968) Flip around diagonal to ensure angle within $[0^\circ : 45^\circ]$. (1.1971) Find values $\phi \leq \alpha < \psi$ from the table in figure 1.2 (using recursive table lookup – at most 3 tests needed). (1.2028) build vector (x, y) interpolated between the sin/cos values for ϕ and ψ using the formula

$$(\cos \phi + k(\cos \psi - \cos \phi), \sin \phi + k(\sin \psi - \sin \phi)) , \quad \text{where } k = \frac{\alpha - \phi}{\psi - \phi}$$

(1.2039) build the chosen vector.

Figure 1.3 shows all directions.

Figure 1.3: All directions.

1.3f. To *drop* an $\langle \text{object} \rangle$ at c with $*$ means to actually physically typeset it in the picture with reference position at c —how this is done depends on the $\langle \text{object} \rangle$ in question and is described in detail in §1.4. The intuition with a drop is that it typesets something at $\langle X_c, Y_c \rangle$ and sets the edge of c accordingly.

Procedure: (1.2108) sets up the direction to allow for directionals and builds the requested $\langle \text{object} \rangle$ in the (global) $\backslash \text{lastobjectbox@}$ box, (1.2110) adjust the picture size unless it is a hidden object, setting $\backslash \text{dimen@} = X_c - L_c$, and (1.2116) drop the object in the picture at the right point by setting box0 and using the $\backslash \text{Drop@@}$ method.

```

2108 \xydef@{\drop@#1#2{
2109 \global\setbox\lastobjectbox@=\object#1{#2}%
2110 \ifHidden@ \dimen@=\X@c \advance\dimen@-\L@c \else

2117 \setboxz@h{\kern\dimen@ \raise\Y@c\box\lastobjectbox@}%
2118 \ht\z@=\z@ \dp\z@=\z@ \wd\z@=\z@ {\Drop@@}\fi}

```

Note: All typesetting into a picture should use or emulate $\backslash \text{drop@}$!

1.3g. The *connect* operation ****** will first compute a number of internal parameters describing the direction from *p* to *c* and then typesets a connection filled with copies of the $\langle \text{object} \rangle$ as illustrated in §1.2.3. The exact details of the connection depend on the actual $\langle \text{object} \rangle$ and are described in general in §1.4. The intuition with a connection is that it typesets something connecting *p* and *c* and sets the ? $\langle \text{pos} \rangle$ operator up accordingly.

Procedure: Set up the direction to allow for directional objects, then save *c*, build the $\langle \text{object} \rangle$ in $\backslash \text{lastobjectbox@}$, restore *c*, and perform the $\backslash \text{Connect@@}$ method to connect using $\backslash \text{lastobjectbox@}$.

```

2144 \xydef@\connect@#1#2{\setupDirection@ \enter@{\cfromthec@}%
2145 \global\setbox\lastobjectbox@=\object#1{#2}\leave@
2146 \Connect@@}

2182 \global\let\preXY@style@ =\connectpreXY@style@
2183 \global\let\postXY@style@=\connectpostXY@style@
2184 \connectRest@@}

```

See note ‘define $\langle \text{shape} \rangle$ ’ for the use of $\backslash \text{preXY@style@}$ and $\backslash \text{postXY@style@}$ to apply special $\langle \text{style} \rangle$ s, specified via $\langle \text{object-modifier} \rangle$ s; being saved here by $\backslash \text{connectStore@}$ as $\backslash \text{connectpreXY@style@}$ and $\backslash \text{connectpostXY@style@}$ to be reset by $\backslash \text{connectRestore@}$.

1.3h. Using ? will “pick a place” along the most recent connection typeset with ******. What exactly this means is determined by the object that was used for the connection and by the modifiers

Figure 1.4: Example <place>s

described in general terms here.

The “shave” modifiers in a <place>, < and >, change the default <factor>, f , and how it is used, by ‘moving’ the positions that correspond to (0) and (1) (respectively): These are initially set equal to p and c , but shaving will move them to the point on the edge of p and c where the connection “leaves/enters” them, and change the default f as indicated. When one end has already been shaved thus then subsequent shaves will correspond to sliding the appropriate position(s) a T\!E\!X $\backslash\text{jot}$ (usually equal to 3pt) further towards the other end of the connection (and past it). Finally the *pick* action will pick the position located the fraction f of the way from (0) to (1) where $f = 0.5$ if it was not set (by <, >, or explicitly).

All this is probably best illustrated with some examples: each \otimes in figure 1.4 is typeset by a sequence of the form $p; c **@{.} ?\langle\text{place}\rangle *{\oplus}$ where we indicate the $?\langle\text{place}\rangle$ in each case. (We also give examples of <slide>s.)

Procedure: The code for parsing <place> is the following. To get first <> to move to edge and the remaining to move a $\backslash\text{jot}$ we have both initial and continuing versions for each, the idea being that the second and following go to the edge of a small temporary object with radius $\backslash\text{jot}$.

Note: This parser tests the *new parsing principle* that $\backslash\text{xy}@$ should always be called as $\backslash\text{xy}@{\text{source}}{\text{target}}!$

```

1.3i. A $\langle \text{slide} \rangle$ will move the position a dimension further along the connection at the picked position. For straight connections (the only ones kernel Xy-pic provides) this is the same as adding a vector in the tangent direction, *i.e.*, $? \dots /A/$ is the same as $? \dots +/A/$.

1.3j. This special $\langle \text{place} \rangle$ finds the point where the last connection intercepts with the line from p to c as setup by the $\langle \text{pos} \rangle$, thus usually this will have the form $! \{ \langle \text{coord} \rangle ; \langle \text{coord} \rangle \}$ ⁴, for example, **Bug:** Only works for straight arrows at present.

```

\xy <1cm,0cm>:
(0,0)*=0{+}="+" ;
(2,1)*=0{\times}="*" **@{.} ,
(1,0)*+{A} ; (2,2)*+{B} **@{-}
?!{"+";"*"} *{\bullet}

```

⁴The braces can be replaced by $(* \dots *)$ *once*, *i.e.*, there can be no other braces nested inside it.

\endxy

will typeset

1.3k. The positions denoted by the *axis intersection* `<coord>`inates `x` and `y` are the points where the line through `p` and `c` intersects with each axis. The following figure illustrates this:

Exercise 1.4: Given predefined points `A`, `B`, `C`, and `D` (stored as objects `"A"`, `"B"`, `"C"`, and `"D"`), write a `<coord>` specification that will return the point where the lines \overline{AB} and \overline{CD} cross (the point marked with a large circle here):

(p.577)

Procedure: We solve the following equation in `a`, `b`:

$$origin + a \times \langle R_c, U_c \rangle = c - b \times (c - p)$$

and then set

$$\langle X_c, Y_c \rangle := \langle X_c, Y_c \rangle - b \times (c - p) \quad \text{with zero size} \quad D_c, U_c, L_c, R_c := 0, 0, 0, 0.$$

The code uses `c = (Xc, Yc, Dc, Uc, Lc, Rc)` and `A, B` as temporaries and computes:

$$\begin{aligned} \langle dX, dY \rangle &:= \langle X_c, Y_c \rangle - \langle X_p, Y_p \rangle \\ \langle A, B \rangle &:= \langle X_c, Y_c \rangle - \langle X_{origin}, Y_{origin} \rangle \\ \langle D_c, L_c \rangle &:= \left\langle \begin{vmatrix} R & dX \\ U & dY \end{vmatrix}, \begin{vmatrix} R & A \\ U & B \end{vmatrix} \right\rangle \\ \langle X_c, Y_c \rangle &:= \langle X_c, Y_c \rangle - (L_c/D_c) \times \langle dX, dY \rangle \end{aligned}$$

where we really do $D := (R/pt)dY - (U/pt)dX$ and similarly for L .

```

2454 \xydef\intersect@{
2455 \d@X=\X@c \advance\d@X-\X@p \d@Y=\Y@c \advance\d@Y-\Y@p
2456 \A@=\X@c \advance\A@-\X@origin \B@=\Y@c \advance\B@-\Y@origin
2457 \edef\next@{\expandafter\removePT@the\R@c}%

```

```

2458 \edef\nextii@{\expandafter\removePT@\the\U@c}%
2459 \D@c=\next@\d@Y \advance\D@c-\nextii@\d@X \divide\D@c\KK@
2460 \L@c=\next@\B@ \advance\L@c-\nextii@\A@ \divide\L@c\KK@
2461 \ifdim\D@c=\z@\zeroDivide@\else \quotient@\next@\L@c\D@c \fi
2462 \advance\X@c-\next@\d@X \advance\Y@c-\next@\d@Y
2463 \czeroEdge@}

```

When there is no intersection point a wrong answer is returned, accompanied by a warning message. This behaviour can be altered by assigning a different value to the hook: `\zeroDivide@`. This macro must store a number in `\next@`.

```

2472 \xydef@\zeroDivide@@{\zeroDivide@message{\intersect@}{treated as 0}\DN@{0}}
2473 \xydef@\zeroDivide@message#1#2{\xywarning@{division by 0 in \string#1, #2}}
2474 \xylet@\zeroDivide@=\zeroDivide@@
2476 \xydef@\zeroDivideLimit@@{\ifdim\L@c=\z@ \DN@{0}}%
2477 \else\ifdim\L@c<\z@\DN@{-\zeroDivide@Limit}}%
2478 \else\DN@{\zeroDivide@Limit}\fi\fi
2479 \zeroDivide@message{\intersect@}{replaced by \zeroDivide@Limit}}
2480 \xydef@\zeroDivideLimit@#1{\edef\zeroDivide@Limit{#1}}%
2481 \let\zeroDivide@=\zeroDivideLimit@@}
2482 \xylet@\zeroDivideLimit=\zeroDivideLimit@

```

By specifying `\zeroDivideLimit{⟨num⟩}` the user can locally establish that $\frac{x}{0} = \text{sgn}(x)\langle\text{num}\rangle$, whenever such a division by zero would otherwise occur in an intersection calculation.

1.3l. A `⟨pos⟩ ⟨decor⟩ grouped` in `{}`-braces⁵ is interpreted in a local scope in the sense that any `p` and `base` built within it are forgotten afterwards, leaving only the `c` as the result of the `⟨coord⟩`. **Note:** Only `p` and `base` are restored – it is not a `TEX` group.

Exercise 1.5: What effect is achieved by using the `⟨coord⟩inate “{;}”`? (p.577)

The code is inside `\POS@`.

1.3m. The vector `/Z/`, where `Z` is a `⟨dimen⟩sion`, is the same as the vector `<Z cos α, Z sin α>` where `α` is the angle of the last direction set by a connection (*i.e.*, with `**`) or subsequent placement (`?`) position.

```

2518 \xydef@\vfromslide@#1{\enter@\DirectionfromtheDirection@ \begingroup
2519 \plainxy@\afterDIRECTIONorEMPTY\vfromslide@i\vfromslide@i#1@}
2521 \xydef@\vfromslide@i#1@{\DN@{#1}}%
2522 \edef\next{\endgroup
2523 \ifx\next@\empty \dimen@=.5pc \else \dimen@=#1\relax \fi
2524 \X@c=\cosDirection\dimen@ \Y@c=\sinDirection\dimen@}\next
2525 \leave@}

```

It is possible to give a `⟨direction⟩` as described in the next section (figure 1.5, note 1.4l in particular) that will then be used to set the value of `α`. It is also possible to omit the `⟨dimen⟩` in which case it is set to a default value of `.5pc`.

⁵One can use `(*...*)` instead also here.

1.3n. A $\langle \text{corner} \rangle$ is an offset from the current $\langle X_c, Y_c \rangle$ position to a specific position on the edge of the c object (the two-letter ones may be given in any combination):

The ‘edge point’ E lies on the edge along the line from p to the centre of the object, in contrast to the ‘proportional’ point P which is also a point on the edge but computed in such a way that the object looks as much ‘away from p ’ as possible. The A point vector is special: it is equal to $\langle 0pt, \fontdimen22\text{font2} \rangle$ and useful for recentering entries.

Finally, a following (f) suffix will multiply the offset vector by the $\langle \text{factor} \rangle f$.

Exercise 1.6: What is the difference between the $\langle \text{pos} \rangle$ itions $c?<$ and $c+E?>$ (p.578)

Exercise 1.7: What does this typeset?

```
\xy *=<3cm,1cm>\txt{Box}*\frm{-}
!U!R(.5) *\frm{.}*\bullet \endxy
```

Hint: \frm is defined by the frame extension and just typesets a frame of the kind indicated by the argument. (p.578)

Bug: Currently only the single-letter corners (L, R, D, U, C, E, and P) will work for any shape—the others silently assume that the shape is rectangular.

1.3o. The *stack* is a special construction useful for storing a sequence of $\langle \text{pos} \rangle$ itions that are accessible using the special $\langle \text{coord} \rangle$ inates s_n , where n is either a single digit or a positive integer in $\{ \}$: s_0 is always the ‘top’ element of the stack and if the stack has depth d then the ‘bottom’ element of the stack has number $s_{\{d - 1\}}$. The stack is said to be ‘empty’ when the depth is 0 and then it is an error to access any of the s_n or ‘pop’ which means remove the top element, shifting what is in s_1 to s_0 , s_2 to s_1 , etc. Similarly, ‘push c ’ means to shift s_0 to s_1 , etc., and then insert the c as the new s_0 .

The stack is manipulated as follows:

$\text{\@}\langle \text{stacking} \rangle$	Action
$\text{\@+}\langle \text{coord} \rangle$	push $\langle \text{coord} \rangle$
$\text{\@-}\langle \text{coord} \rangle$	$c \leftarrow \langle \text{coord} \rangle$ then pop
$\text{\@=}\langle \text{coord} \rangle$	load stack with $\langle \text{coord} \rangle$
$\text{\@@}\langle \text{coord} \rangle$	do $\langle \text{coord} \rangle$ for $c \leftarrow$ stack
\@i	initialise
\@(enter new frame
\@)	leave current frame

To ‘load stack’, means to load the entire stack with the positions set by $\langle \text{coord} \rangle$ within which , means ‘push c ’.

To ‘do $\langle \text{coord} \rangle$ for all stack elements’ means to set c to each element of the stack in turn, from the bottom and up, and for each interpret the $\langle \text{coord} \rangle$. Thus the first interpretation has c set to the bottom element of the stack and the last has c set to s_0 . If the stack is empty, the $\langle \text{coord} \rangle$ is not interpreted at all.

These two operations can be combined to repeat a particular $\langle \text{coord} \rangle$ for several points, like this:

```
\xy
@={ (0,-10), (10,3), (20,-5) } @*{P}
\endxy
```

will typeset

Finally, the stack can be forcibly cleared using \textcircled{i} , however, this is rarely needed because of \textcircled{c} , which saves the stack as it is, and then clears it, such when it has been used (and is empty), and \textcircled{c} is issued, then it is restored as it was at the time of the \textcircled{c} .

Exercise 1.8: How would you change the example above to connect the points as shown below?

(p.578)

First the stack top and bottom, both initially -1 :

```
2680 \xydef@s@bot{-1}
2681 \xydef@s@top{-1}
```

Next the function to set $c \leftarrow s_n$, i.e., test that $bot < n + bot < top$ and then run the associated stack element.

```
2688 \xydef@c@froms@#1{\tests@{#1}\runs@\outofranges@}
2690 \xydef@tests@#1#2#3{\DN@{#3}%
2691 \count@=\s@top \advance\count@-#1\relax
2692 \ifnum\count@>\s@bot\relax \ifnum\count@>\s@top\else\DN@{#2}\fi\fi
2693 \next@}
2695 \xydef@runs@{\csname S@\the\count@\endcsname}
2697 \xydef@outofranges@{\count@=\s@top \advance\count@-\s@bot
2698 \xyerror@{stack index out of range (should be 0..\the\count@)}{}}
```

Finally the actual code to do the stack operations: it depends on the ‘code’ passed after \textcircled{c} ; spaces are not allowed:

```

2782 \else \let\next@=\relax
2783 \fi \next@}

```

1.3p. It is possible to define new $\langle\text{coord}\rangle$ inates on the form " $\langle\text{id}\rangle$ " by *saving* the current c using the $\dots=\langle\text{id}\rangle$ $\langle\text{pos}\rangle$ ition form. Subsequent uses of " $\langle\text{id}\rangle$ " will then reestablish the c at the time of the saving.

Using a " $\langle\text{id}\rangle$ " that was never defined is an error, however, saving into a name that was previously defined just replaces the definition without warning, *i.e.*, " $\langle\text{id}\rangle$ " always refers to the last thing saved with that $\langle\text{id}\rangle$.

However, many other things can be ‘saved’: in general $\langle\text{saving}\rangle$ has either of the forms

$\langle\text{id}\rangle$	" $\langle\text{id}\rangle$ " restores current <i>base</i>
$\langle\text{coord}\rangle\langle\text{id}\rangle$	" $\langle\text{id}\rangle$ " reinterprets $\langle\text{coord}\rangle$
$\langle\text{id}\rangle$	$\langle\text{id}\rangle$ reloads this stack

The first form defines " $\langle\text{id}\rangle$ " to be a macro that restores the current *base*.

The second does not depend on the state at the time of definition at all; it is a macro definition. You can pass parameters to such a macro by letting it use coordinates named "1", "2", etc., and then use ="1", ="2", etc., just before every use of it to set the actual values of these. **Note:** it is not possible to use a $\langle\text{coord}\rangle$ of the form " $\langle\text{id}\rangle$ " directly: write it as $\{\langle\text{id}\rangle\}$.

Exercise 1.9: Write a macro "dbl" to double the size of the current c object, *e.g.*, changing it from the dotted to the dashed outline in this figure:

(p.578)

The final form defines a special kind of macro that should only be used after the $\langle\text{id}\rangle$ stack operation: the entire current stack is saved such that the stack operation $\langle\text{id}\rangle$ will reload it.

Note: There is no distinction between the ‘name spaces’ of $\langle\text{id}\rangle$ s used for saved coordinates and other things.

This parser distinguishes between the cases:

```

1.4 Objects

2921 \message{objects,}

Objects are the entities that are manipulated with the `*` and `**` $\langle\text{pos}\rangle$ operations above to actually get some output in XY -pictures. As for $\langle\text{pos}\rangle$ itions the operations are interpreted strictly from left to right, however, the actual object is built *before* all the $\langle\text{modifier}\rangle$ s take effect. The syntax of objects is given in figure 1.5 with references to the notes below. **Remark:** It is *never* allowed to include braces `{}` inside $\langle\text{modifier}\rangle$ s! In case you wish to do something that requires `{...}` then check in this manual whether you can use `(*...*)` instead. If not then you will have to use a different construction!

We first discuss the parser and then summarise the required methods. The entry point to use of objects is `\object` described in note 1.4c. This should always be used because it initialises the token list and redefines `\xy@` to be `\addtotoks@` such that we can use $\langle\text{pos}\rangle$ parser routines within the $\langle\text{object}\rangle$!

Parsing: The $\langle\text{object}\rangle$ parser `\OBJECT@` will first parse the $\langle\text{modifier}\rangle$ s, storing the action of each in sequence on the `\toks@` token list. When there are no more modifiers we insert `\objectbox` if we have reached the `{` otherwise we just assume that the rest of the $\langle\text{object}\rangle$ is some kind of box construction.

Note: The $\langle\text{modifier}\rangle$ actions doing shifts are implemented by having an independent vector for the shift: $\langle R_p, U_p \rangle$ always contains the vector from the current to the original $\text{T}_{\text{E}}\text{X}$ reference point; furthermore the initial L_c is saved as L_p such that we can retrieve the original (XY-pic) reference point again. Modifying the p values is safe because all actual changes are done in a local scope after the entire $\langle\text{object}\rangle$ is parsed and we have built the object box (in `\OBJECT@@`).

The $\langle\text{modifier}\rangle$ s changing the direction are executed while parsing to make sure that the direction used when building the $\langle\text{object}\rangle$ is right, and restored in the right sequence while evaluating the $\langle\text{modifier}\rangle$ s afterwards.

```

As an optimisation `\OBJECT@` sets the edge type of all zero-sized objects to `\zeroEdge`.

`\OBJECT@x` cleans up the object by ensuring that it defines all the required methods: Essentially it terminates the box with the sequence “`}` `\def\Drop@@{...}` `\def\Connect@@{...}` `\D@c=... \U@c=... \L@c=... \R@c=... \Invisible@... \Hidden@... \def\Leftness@{...}` `\def\Upness@{...}`” where each `...` is set to the method defined within the object creation environment (started with `\hbox{` in `\OBJECT@` or possibly elsewhere). We use rather heavy expansion hacking with `\toks@` to create the sequence so please look the other way... ☺

```

```

Methods: In addition to the “current object properties” for c (cf. 1.2.5) the following methods are set up by all objects:

<code>\Invisible@true</code> or <code>\Invisible@false</code>	whether object is invisible ^{1.4i}
<code>\Hidden@true</code> or <code>\Hidden@false</code>	whether object is hidden ^{1.4h}
<code>\def\Leftness@{<factor>}</code>	the desired $L/(L + R)$
<code>\def\Upness@{<factor>}</code>	the desired $U/(D + U)$
<code>\def\Drop@@{...}</code>	code that outputs the object, assuming <code>\boxz@</code> is of zero size and has the object displaced $\langle X, Y \rangle$ inside—usually just <code>\def</code> ’d to <code>\styledboxz@</code>
<code>\def\Connect@@{...}</code>	code that builds a connection from p to c , assuming <code>\lastobjectbox@</code> contains the object

It is important to `\def` and not `\let` the last four methods since the \TeX technique used in `\OBJECT@x` (and elsewhere) of passing them to surrounding scopes depends on it. The `\Connect@@` method should in turn setup several submethods as described in detail in 1.8.3.

Suitable defaults are set up by `\OBJECT@` above which is why any box generating command can be used to construct objects as explained in note 1.4a below.

Here are the declarations:

```

3228 \xynew@{if}\ifInvisible@
3229 \xynew@{if}\ifHidden@
3231 \xydef@<Leftness@{ }
3232 \xydef@<Upness@{ }
3234 \xydef@<Drop@@{\styledboxz@}
3235 \xydef@<Connect@@{ }

```

Notes

1.4a. An $\langle\text{object}\rangle$ is built using `\objectbox { $\langle\text{text}\rangle$ }`. `\objectbox` is initially defined as

```
\def\objectbox#1{%
  \hbox{ $\langle\text{objectstyle}\{#1\}\rangle$ }
  \let\objectstyle=\displaystyle
```

but may be redefined by options or the user. The $\langle\text{text}\rangle$ should thus be in the mode required by the `\objectbox` command—with the default `\objectbox` shown above it should be in math mode.

Actually it is

```
3262 \xydef@\objectbox#1{\hbox{ $\langle\text{m@th}\langle\text{objectstyle}\{#1\}\rangle$ }}
```

```
3264 \xylet@\objectstyle=\textstyle
```

1.4b. An $\langle\text{object}\rangle$ built from a $\text{T}_{\text{E}}\text{X}$ box with dimensions $w \times (h + d)$ will have $L_c = R_c = w/2$, $U_c = D_c = (h + d)/2$, thus initially be equipped with the adjustment `!C` (see note 1.4f). In particular: in order to get the reference point on the (center of) the base line of the original $\langle\text{T}_{\text{E}}\text{X}\text{ box}\rangle$ then you should use the $\langle\text{modifier}\rangle$ `!`; to get the reference point identical to the $\text{T}_{\text{E}}\text{X}$ reference point use the modifier `!!L`.

$\text{T}_{\text{E}}\text{X}$ nical remark: Any macro that expands to something that starts with a $\langle\text{box}\rangle$ may be used as a $\langle\text{T}_{\text{E}}\text{X}\text{ box}\rangle$ here.

This is done by the parsing above.

1.4c. Takes an object and constructs it, building a box; it is then processed according to the preceding modifiers. This form makes it possible to use any $\langle\text{object}\rangle$ as a $\text{T}_{\text{E}}\text{X}$ box (even outside of X_{Y} -pictures) because a finished object is always also a box.

This macro is the main entry point to the $\langle\text{object}\rangle$ parser. It furthermore initialises the modifier list and the previous object edge.

```
3300 \xydef@\object{\hbox\bgroup\resetStyle@\object@}
```

```
3302 \xydef@\object@{%
```

```
3303   \edef\next@{=\langle\text{DirectionfromtheDirection}\rangle}\expandafter\toks@\next@
```

```
3304   \plainxy@ \xyFN@\OBJECT@}
```

The initial value of `\toks@` $\langle\text{modifier}\rangle$ list is explained in note 1.4l below.

1.4d. Several $\langle\text{object}\rangle$ s can be combined into a single object using the special command `\composite` with a list of the desired objects separated with `*`s as the argument. The resulting box (and object) is the least rectangle enclosing all the included objects.

First we collect all the objects smash on top of each other in `box0` while we maintain the maximal extents in $(DULR)_p$. Then we reset `box0` to contain the same but with the right spacing around.

```

```

1.4e. Take an entire $\mathbb{X}\mathbb{Y}$ -picture and wrap it up as a box as described in §1.2.1. Makes nesting of $\mathbb{X}\mathbb{Y}$ -pictures possible: the inner picture will have its own zero point which will be its reference point *in* the outer picture when it is placed there.

This is simple exploiting the fact that `\endxy` actually sets up the extents of the ‘object’:

```

3397 \xydef@ \xybox#1 { \xy#1 \endxy \Edge@c = { \rectangleEdge } \computeLeftUpness@ }

```

1.4f. An object is *shifted* a \langle vector \rangle by moving the point inside it which will be used as the reference

point. This effectively pushes the object the same amount in the opposite direction.

Shifting uses the special value of R_p and U_p used while evaluating the \langle modifier \rangle s. The fact that shifts like !C refer to the initial object's size means that we should parse the \langle vector \rangle such that its actions happen at modification time... hence \backslash xytotoks@ is used to delay execution.

```

3417 \xydef@OBJECT@shift{%
3418 \let\xy@=\xytotoks@ \afterVECTORorEMPTY
3419 {\OBJECT@shift@}%
3420 {\addtotoks@{\X@c=-\L@c \advance\X@c\R@p \advance\X@c\L@p \Y@c=\U@p}%
3421 \OBJECT@shift@}}
3423 \xydef@OBJECT@shift@{%
3424 \addtotoks@{\advance\U@p-\Y@c
3425 \advance\L@c\X@c \advance\R@c-\X@c \advance\D@c\Y@c \advance\U@c-\Y@c
3426 \computeLeftUpness@}%
3427 \let\xy@=\oxy@ \xyFN@OBJECT@}

```

Exercise 1.10: What is the difference between the \langle pos \rangle itions $0*\{a\}!DR$ and $0*!DR\{a\}$? (p.578)

1.4g. A \langle size \rangle is a pair $\langle W, H \rangle$ of the width and height of a rectangle. When given as a \langle vector \rangle these are just the vector coordinates, *i.e.*, the \langle vector \rangle starts in the lower left corner and ends in the upper right corner. The possible \langle add op \rangle erations that can be performed are described in the following table.

\langle add op \rangle	description
+	grow
-	shrink
=	set to
+=	grow to at least
-=	shrink to at most

In each case the \langle vector \rangle may be omitted which invokes the “default size” for the particular \langle add op \rangle :

\langle add op \rangle	default
+	$+<2 \times objectmargin>$
-	$-<2 \times objectmargin>$
=	$=<objectwidth, objectheight>$
+=	$+=<\max(L_c + R_c, D_c + U_c)>$
-=	$-=<\min(L_c + R_c, D_c + U_c)>$

The defaults for the first three are set with the commands

```

\objectmargin <add op> {<dimen>}
\objectwidth <add op> {<dimen>}
\objectheight <add op> {<dimen>}

```

where \langle add op \rangle is interpreted in the same way as above.

```

3491 \xylet@objectmargin@=\jot
3492 \xylet@objectwidth@=\z@
3493 \xylet@objectheight@=\z@
3495 \xydef@objectmargin{\afterADDOP{\Addop@@objectmargin@}}
3496 \xydef@objectwidth{\afterADDOP{\Addop@@objectwidth@}}

```

```
3497 \xydef@objectheight{\afterADDOP{\Addop@@objectheight@}}
```

The defaults for +=/= are such that the resulting object will be the smallest containing/largest contained square.

Exercise 1.11: How are the objects typeset by the <pos>itions “*+UR{\sum}” and “*+DL{\sum}” enlarged? (p.578)

Bug: Currently changing the size of a circular object is buggy—it is changed as if it is a rectangle and then the change to the R parameter affects the circle. This should be fixed probably by a generalisation of the o shape to be ovals or ellipses with horizontal/vertical axes.

The three cases distinguished by the parsing above are handled similarly: they insert the parsed/default vector into X, Y in the modifications and then perform the operation at that time using the `\xytotoks@` trick described in note 1.4f:

```
3529 \xydef@OBJECT@change{%
3530 \afterADDOP{%
3531 \addEQ@{ifx \next
3532 \addtotoks@{\X@c=\D@c \advance\X@c\U@c \Y@c=\L@c \advance\Y@c\R@c}%
3533 \else
3534 \addtotoks@{\X@c=objectmargin@ \advance\X@c\X@c \Y@c=\X@c}%
3535 \fi
3536 \let\xy@=\xytotoks@
3537 \afterVECTORorEMPTY\OBJECT@change@OBJECT@change@}}
3539 \xydef@OBJECT@set{%
3540 \afterADDOP{%
3541 \let\xy@=\xytotoks@ \afterVECTORorEMPTY\OBJECT@change@
3542 {\addtotoks@{\X@c=objectwidth@ \Y@c=objectheight@}\OBJECT@change@}}}
```

The real work is done by the following command: a hack using expansion tricks to make use of the `\Addop@@` known now on the values in X, Y at modification time.

```
3550 \xydef@OBJECT@change@{%
3551 \addtotoks@{\advance\R@c\L@c \advance\R@c-\L@c \let\tmp@=\R@c}%
3552 \expandafter\addtotoks@\expandafter{\Addop@@\tmp@\X@c\R@c=\tmp@
3553 \L@c=\Leftness@\R@c \advance\R@c\L@c \advance\R@c-\L@c}%
3554 \addtotoks@{\advance\D@c\U@c \let\tmp@=\D@c}%
3555 \expandafter\addtotoks@\expandafter{\Addop@@\tmp@\Y@c\D@c=\tmp@
3556 \U@c=\Upness@\D@c \advance\D@c-\U@c}%
3557 \let\xy@=\oxy@ \xyFN@OBJECT@}
```

It is clearly crucial that `\Addop@@` expands to its action immediately! Also note that enlarging changes the initial box offset in the horizontal direction only, *i.e.*, R_p .

Finally the code to interpret an <add op> used above: This simply parses it and creates a macro `\Addop@@` that takes a control sequence and a parameter <dimen> as arguments, and expands

directly to commands that perform the $\langle \text{add op} \rangle$ of the $\langle \text{dimen} \rangle$ on the control sequence:

$\langle \text{add op} \rangle$	effect of $\backslash \text{Addop}@@ cs D$
+	$cs \leftarrow cs + D$
-	$cs \leftarrow cs - D$
=	$cs \leftarrow D$
+=	$cs \leftarrow \begin{cases} D & \text{if } D \leq cs \\ cs & \text{if } D > cs \end{cases}$
-=	$cs \leftarrow \begin{cases} D & \text{if } D \geq cs \\ cs & \text{if } D < cs \end{cases}$

Furthermore $\backslash \text{afterADDOP}$ leaves the $\backslash \text{next}$ token set to = in the last three cases only (this is used to determine the right default value in the size changes above).

The $\backslash \text{afterADDOP}$ macro is relatively simple because $\langle \text{add op} \rangle$ s don't nest:

```

3598 \xydef\afterADDOP#1{\def\afterADDOP@{#1}\xyFN\ADDOP@}
3600 \xylet\afterADDOP@=\empty
3602 \xydef\ADDOP@{
3603   \ifx \space\next \expandafter\DN\space{\xyFN\ADDOP@}%gobble spaces
3604   \else\addPLUS\ifx \next \addPLUS\DN{\xyFN\ADDOP@plus}%
3605   \else\addDASH\ifx \next \addDASH\DN{\xyFN\ADDOP@minus}%
3606   \else\addEQ\ifx \next
3607     \addEQ\DN{\def\Addop@{\Addop@0+=}\afterADDOP@}%
3608   \else
3609     \DN{\def\Addop@{\Addop@0+=}\afterADDOP@}%
3610   \fi\fi\fi\fi \next@}
3612 \xydef\ADDOP@plus{
3613   \addEQ\ifx \next
3614     \addEQ\DN{\def\Addop@{\Addop@0+<}\afterADDOP@}%
3615   \else
3616     \DN{\def\Addop@{\Addop@1+=}\afterADDOP@}%
3617   \fi \next@}
3619 \xydef\ADDOP@minus{
3620   \addEQ\ifx \next
3621     \addEQ\DN{\def\Addop@{\Addop@0+>}\afterADDOP@}%
3622   \else
3623     \DN{\def\Addop@{\Addop@1-=}\afterADDOP@}%
3624   \fi \next@}

```

The work is done by the general $\backslash \text{Addop} @ \{f\} \{\pm\} \{\bowtie\} \{cs\} D$ that defines

$$cs \equiv \begin{cases} f \times cs \pm D & \text{if } \neg((f \times cs \pm D) \bowtie D) \\ cs & \text{otherwise} \end{cases}$$

and also leaves the dimension in $\backslash \text{dimen} @$.

```

3638 \xydef\Addop@#1#2#3#4#5{
3639   \dimen@=#4\relax \edef#4{\the\dimen@}%
3640   \dimen@=#1\dimen@ \advance\dimen@#2#5\relax %\advance\dimen@ 1sp %HACK
3641   \ifdim\dimen@#3#4\else \edef#4{\the\dimen@}\fi

```

```

3642 \ifx\xy\xyinitial@else \DN@##1{\xy@{\edef#4{##1}\checkZeroEdge}}%
3643 \expandafter\next@\expandafter{#4}\fi}

```

1.4h. A *hidden* object will be typeset but hidden from X_Y-pic in that it won't affect the size of the entire picture as discussed in §1.2.1.

This is handled by the `\ifHidden@` conditional allocated with the methods.

1.4i. An *invisible* object will be treated completely normal except that it won't be typeset, *i.e.*, X_Y-pic will behave as if it was.

This is handled by the `\ifInvisible@` conditional allocated with the methods.

1.4j. Setting the *shape* of an object forces the shape of its edge to be as indicated. The kernel provides three shapes that change the edge, namely `[.]`, `[]`, and `[o]`, corresponding to the outlines

where the `x` denotes the point of the reference position in the object (the first is a point). Extensions can provide more shapes, however, all shapes set the extent dimensions `L`, `R`, `D`, and `U`.

The default shape for objects is `[]` and for plain coordinates it is `[.]`.

```

3705 \xydef@objectEdge{\rectangleEdge}

```

Furthermore the `(shape)s` `[r]`, `[l]`, `[u]`, and `[d]`, are defined for convenience to adjust the object to the indicated side by setting the reference point such that the reference point is the same distance from the opposite of the indicated edge and the two neighbour edges but never closer to the indicated side than the opposite edge, *e.g.*, the object `[r]\hbox{Wide text}` has reference point at the `x` in `Wide text` but the object `[d]\hbox{Wide text}` has reference point at the `x` in `Wide text`. Finally, `[c]` puts the reference point at the center.

```

3720 \xydefcsname@{shape [r]}{\advance\U@p\D@c \centerobject@
3721 \ifdim\L@c>\D@c
3722 \advance\R@c\L@c \L@c=.5\U@c \advance\L@c.5\D@c \advance\R@c-\L@c \fi
3723 \advance\U@p-\D@c}
3724 \xydefcsname@{shape [l]}{\advance\U@p\D@c \centerobject@
3725 \ifdim\L@c>\D@c
3726 \advance\L@c\R@c \R@c=.5\U@c \advance\R@c.5\D@c \advance\L@c-\R@c \fi
3727 \advance\U@p-\D@c}
3728 \xydefcsname@{shape [u]}{\advance\U@p\D@c \centerobject@
3729 \ifdim\D@c>\L@c
3730 \advance\U@c\D@c \D@c=.5\L@c \advance\D@c.5\R@c \advance\U@c-\D@c \fi
3731 \advance\U@p-\D@c}
3732 \xydefcsname@{shape [d]}{\advance\U@p\D@c \centerobject@
3733 \ifdim\D@c>\L@c
3734 \advance\D@c\U@c \U@c=.5\L@c \advance\U@c.5\R@c \advance\D@c-\U@c \fi
3735 \advance\U@p-\D@c}
3736 \xydefcsname@{shape [c]}{\advance\U@p\D@c \centerobject@ \advance\U@p-\D@c}
3738 \xydef@centerobject@{%
3739 \advance\D@c\U@c \D@c=.5\D@c \U@c=\D@c \advance\L@c\R@c \L@c=.5\L@c \R@c=\L@c}

```

Note: Extensions can add new $\langle\text{shape}\rangle$ object $\langle\text{modifier}\rangle$ s which are then called $\langle\text{style}\rangle$ s. These will always be either of the form $[\langle\text{keyword}\rangle]$ or $[\langle\text{character}\rangle \langle\text{argument}\rangle]$. Some of these $\langle\text{style}\rangle$ s do other things than set the edge of the object.

A “simple shape” is just a control sequence $\backslash\text{shape} [\langle\text{shape}\rangle]$ setting the appropriate edge. When such a $[\langle\text{shape}\rangle]$ modifier is encountered then we expand this control sequence onto the modifier queue, unless a control sequence $\backslash\text{style} [\langle\text{shape}\rangle]$ exists: then that is expected to do it (and whatever else is required).

```

3756 \xydef\OBJECT@shape#1{\DN@{shape [#1]}}%
3757 \expandafter\let\expandafter\nextii@\csname\codeof\next@\endcsname

3771 \xydefcsname@{shape [.]}\czeroEdge@}

```

Add more simple shapes by defining more commands like these and proceed with coding the $\backslash\dots\text{Edge}$ command as described in §1.8.2.

Alternatively it is a “complex shape” of which none are defined in the kernel but some options like more variation. . . It is characterised by its first token and the rest of the contents of the $[\]$ s is the argument (remember: no $\{ \}$ $[\]$ characters!); it is searched for as control sequence $\backslash[\langle\text{shape}\rangle\dots]$ overridden in the same way by $\backslash*\text{stylechar}@\langle\text{shape}\rangle@$.

```

3799 \fi \next@}

```

Bug: The above is messy!

1.4k. While typesetting an object, some of the properties are considered part of the ‘current object style’. Initially this means nothing but some of the $\langle\text{style}\rangle$ s defined by extensions have this status, e.g., colours $[\text{red}]$, $[\text{blue}]$ say, using the xycolor extension, or varying the width of lines using

`xyline`. Such styles are processed *left-to-right*; for example,

```
*[red] [green] [=NEW] [blue]{A}
```

will typeset a blue A and define `[NEW]` to set the colour to green (all provided that `xycolor` has been loaded, of course).

The method of requesting a special effect is via the `<shape>` modifiers. However the code required for implementation is quite different. In particular it must allow for the different ways in which the `<driver>` may implement the `\specials` required to activate, and turn off, the effect. Another difficulty is that the `<style>` applies also to nested sub-parts of any `<object>`. This means that the code cannot be wholly delayed until after the `<object>` has been constructed.

Usually some value has to be stored, so as to be accessible to sub-parts, though the `\special` commands cannot be fully constructed until the `<object>` is completely known and ready to be `\Drop@@` or `\Connect@@`'ed.

Finally, the overhead in using `\special` commands can be quite high with some `dvi`-drivers. Thus it is not best that every `<style>` request generate a `\special` command; indeed *two* `\special` commands, since each style-change also requires a command to revert to the previous style, after the change is no longer applicable.

Thus, as with `<shape>`s, all the style-change requests are stored until the `<object>` is ready to be `\Drop@@`'ed. This also helps with getting the sequencing correct when later requests compound on, or override, earlier requests.

When the `<style>` requests are processed, after the `<object>` has been constructed, information of the form `<control-word>{<data>}` is added to a global list called `\preXY@style@`. Similar information is added to another global list `\postXY@style@`, for the purpose of reverting the style parameters, within the `<driver>`-file, to their previous values prior to the current `<object>`.

Both lists are initially `<empty>` at the start of an `<object>`. The contents of these lists are processed when the macros `\xypre@Style@@` and `\xypost@Style@@` are encountered in the expansion of `\styledboxz@`.

```
3860 \xydef@\preXY@style@{}
```

```
3861 \xydef@\postXY@style@{}
```

```
3863 \xydef@\resetStyle@{\gdef\preXY@style@{ }\gdef\postXY@style@{}}
```

The `<data>` contains the code needed to implement the requested style-change, with the particular `<driver>` being used.

The `<control-word>` is a macro whose expansion could be fixed, or could depend upon what other style-change requests are made for this `<object>`. Its purpose is to decide whether or not the `<data>` is actually required. If so, it is added to the token-list `\styletoks@` for later use.

Whether the `<control-word>{<data>}` tokens are prepended or appended to the global lists depends upon the nature of the style-change requested. For example, with `*[red] [green]<object>` the information `\<set-color>{<green>}` could be appended to `\preXY@style@`, with `\<revert-to-color>{<red>}` prepended to `\postXY@style@`. Then the `dvi`-output would set the color to `<red>` then `<green>` and restore it first to `<red>` then `<black>`.

To Do: A more sophisticated implementation could instead prepend `\<set-color>{<green>}` to `\preXY@style@` and append `\<revert-to-color>{<red>}` to `\postXY@style@`. Now the first `\<set-color>` encountered adds its `<data>` to `\styletoks@` then rebinds `\<set-color>` to `\eat@`, to ignore subsequent occurrences. Similarly `\<revert-to-color>` is rebound so that only the restoration to `<black>` is retained.

This latter strategy is preferred when the overhead for a `\special` command is high, within the `<driver>`'s output. Indeed the POSTSCRIPT back-end is even more efficient. Since POSTSCRIPT is itself a programming language, the `<data>` can be just the POSTSCRIPT code. A single `\special` command is sufficient to accommodate *all* the style-changes for an individual `<object>`. This is achieved by rebinding `\xydoprestyles@@` and `\xydopoststyles@@` to include the `<data>` within an appropriately prepared `\special` command.

```
3901 \xynew@{toks}{\styletoks@}
3902 \xydef@{adddostyletoks@#1}{%
3903 \expandafter\styletoks@\expandafter{\the\styletoks@#1}}
```

The `<data>` to be used is collected in the token-list `\styletoks@`. If this is `<empty>` for an `<object>` then the style processing is skipped completely. For safety, in case multiple occurrences of `\xypre@Style@` have somehow slipped into the token stream, these and `\xypost@Style@@` are bound to `\relax` until the `<object>` is finished. Indeed `\xypost@Style@@` is always bound to `\relax` unless `\styletoks@` is non-empty.

Some extensions use the following macros to add style `<data>` to the global macros. Here code is

added sequentially to `\preXY@style@` so that it is acted upon in the order of occurrence (FIFO) of the `\shape` modifiers. Code is added to `\postXY@style@` in reverse order (LIFO), so that each addition to `\preXY@style@` can be closed off, if necessary, in correctly nested sequence.

```

The `\preStyle@` and `\postStyle@` temporarily hold style `\data`. The macro `\preXYstyle@@` is used to check whether there is any `\data` to process. Normally this is just an alias for `\preStyle@@`, but some back-ends may use the two control-names differently.

```

3987 \xydef@\preStyle@@{}
3988 \xydef@\postStyle@@{}
3989 \xydef@\preXYstyle@@{\relax}
3991 \xydef@\loadxystyle@{%
3992 \let\xypre@Style@@=\xypre@Style@ \def\preXYstyle@@{\preStyle@@}}
3994 \loadxystyle@

```

Initially styles are activated but can be suppressed using `\Unloadstyle@`.

```

4001 \xydef@\Unloadstyle@{%
4002 \let\xypre@Style@@=\relax \let\xypost@Style@@=\relax
4003 \def\preXYstyle@@{\relax}}

```

Global macros are used, so that the same styles can be reused by successive objects without having to re-interpret `\shape` modifiers, as described next.

Saving styles: Once specified for an `\object`, the collection of `\style`s can be assigned a name, using `[=(word)]`. Then `[<word>]` becomes a new `\style`, suitable for use with the same or other `\objects`s. Use a single `\word` built from ordinary letters. If `[<word>]` already had meaning the new definition will still be imposed, but the following type of warning will be issued:

Xy-pic Warning: Redefining style `[<word>]`

The latter warning will appear if the definition occurs within an `\xymatrix`. This is perfectly normal, being a consequence of the way that the matrix code is handled. Similarly the message may appear several times if the style definition is made within an `\ar`.

The following illustrates how to avoid these messages by defining the style without typesetting anything.

```
\setbox0=\hbox{%
  \xy\drop[OrangeRed] [=A]{}\endxy}
```

Note 1: The current colour is regarded as part of the style for this purpose.

Note 2: Such namings are global in scope. They are intended to allow a consistent style to be easily maintained between various pictures and diagrams within the same document.

```
4047 \xydefcsname@{shape [=...]}#1{\checkXyStyle@ \addtotoks@{\xynamestyle@{#1}}}

Support for a new `<style>` takes the following form, in which `\thestyle@` expands to the current value of the `<style>` information to be maintained. If this is kept in a `<count>` or `<dimen>` register, named `\xystyle@` say, then replace `\thestyle@` by `\the\xystyle@`. (However due to the large number of `<dimen>`s already allocated, it is preferable to keep a text form of the value in `\thestyle@`.)

```

\xyshape@stylechange@{\modifystyle@{<how>}}
\xydef@{modifystyle@#1{\checkXyStyle@
\edef\prevstyle@{\thestyle@}\modifystyle@@{#1}%
\let\prestyle@=\prestyle@@ \let\poststyle@=\poststyle@@
\applystyle@{prestyle@{\thestyle@}\poststyle@{\prevstyle@}}
\xydef@{resetstyle@@#1{\def\thestyle@{#1}\outputstyle@{#1}}
\xydef@{outputstyle@#1{\transformstyle@{#1}%
\expandafter\stylespecial@\expandafter{\next@}}
\xylet@{transformstyle@@=\DN@
\xylet@{transformstyle@=\transformstyle@@

```

In the above the macros `\modifystyle@@` and `\stylespecial@` are adapted to the particular `<style>` information, see below. Typically `<how>` is actual T_EX code and `\modifystyle@@` is simply `\literal@` to execute this code. Typesetting is done by `\stylespecial@#1` which is typically of the form `\special{<key> #1}`.

The `\transformstyle@` is required in case a dvi-`<driver>` needs information in a form that is different to how X_Y-pic maintains it in `\thestyle@`. A `<driver>` file should define `\<driver>@style@@` to perform the transformation and place its result in `\next@`. Install this macro using `\let\transformstyle@=\<driver>@style@@` within the `<driver>` installation macro.

Next we discuss `\applystyle@`; which uses `\prestyle@`, `\prestyle@@`, `\poststyle@` and `\poststyle@@`. There are two strategies here, affecting how much information is placed into the dvi-file, indicated by the alternative expansions given above. The appropriateness for a given style must be decided by the author of the style-option.

Suppose several modifications are made to a particular style parameter. We must build a list of commands `\prestyle@{<value>}`, to be executed later, which will recover the required value. Also we build a list of commands `\poststyle@{<value>}` to reset to the previous value.

In most cases it is only the result of the modifications that need be placed into the dvi-file. Since we do not know how many, if any, more modifications follow we could store each new result *after* the previous, so that its effect will override the previous value. This is building a FIFO list for the `\prestyle@` commands, with a FILO list for the `\poststyle@` commands:

```

4169 \xydef@{applyFIFOstyle@#1#2#3#4{\bgroup
4170 \styletoks@={\egroup\gdef\preXY@style@}%
4171 \expandafter\toks@\expandafter{\preXY@style@}%
4172 \expandafter\addtotoks@\expandafter{\expandafter#1\expandafter{#2}}%
4173 \expandafter\addtostyletoks@\expandafter{\expandafter{\the\toks@}%
4174 \gdef\postXY@style@}%
4175 \expandafter\toks@\expandafter{\expandafter#3\expandafter{#4}}%

```

```

4176 \expandafter\addtotoks@\expandafter{\postXY@style@}%
4177 \expandafter\addtostyletoks@\expandafter{\expandafter{\the\toks@}}%
4178 \the\styletoks@ }

```

Use this via: `\applyLIFOstyle@\prestyle@{\thestyle@}\poststyle@\prevstyle@`.

With this method each modification places two entries into the dvi-file; there is no need for separate `\prestyle@` and `\prestyle@@` macros.

Perhaps a more efficient strategy is to build a LIFO list for the `\prestyle@` commands. This way the required value is encountered first. This first instance should then cancel all subsequent instances of `\prestyle@`. This is where the need comes for a `\prestyle@@`. Accompanying this is a FIFO list for the `\poststyle@` commands, with a corresponding `\poststyle@@` to kill subsequent instances:

```

4197 \xydef@\applyLIFOstyle@#1#2#3#4{\bgroup
4198 \styletoks@={\egroup\gdef\preXY@style@}%
4199 \expandafter\toks@\expandafter{\expandafter#1\expandafter{#2}}%
4200 \expandafter\addtotoks@\expandafter{\preXY@style@}%
4201 \expandafter\addtostyletoks@\expandafter{\expandafter{\the\toks@}}%
4202 \gdef\postXY@style@}%
4203 \expandafter\toks@\expandafter{\postXY@style@}%
4204 \expandafter\addtotoks@\expandafter{\expandafter#3\expandafter{#4}}%
4205 \expandafter\addtostyletoks@\expandafter{\expandafter{\the\toks@}}%
4206 \the\styletoks@ }

```

Use this via: `\applyLIFOstyle@\prestyle@{\thestyle@}\poststyle@\prevstyle@`.

The advantage here is that only two pieces of data need be output to the dvi-file, no matter how many modifications are requested.

1.4l. Setting the current direction is simply pretending for the typesetting of the object (and the following `<modifier>`s) that some connection set it – the `<empty>` case just inherits the previous direction.

The code just calls the general `<direction>` parser below:

```

4230 \xydef@\OBJECT@direction{\afterDIRECTIONorEMPTY{%
4231 \edef\next@{\DirectionfromtheDirection@}\expandafter\addtotoks@\next@
4232 \xyFN@\OBJECT@}%
4233 {\xyFN@\OBJECT@}}

```

Here is the `<direction>` parser: first the parts parsing the `<diag>` part then the parts parsing the `<trailer>` part:

```

4240 \xydef@\afterDIRECTIONorEMPTY#1#2{%
4241 \DN@##1{\def\afterDIRECTION@{\def\afterDIRECTION@{##1}%
4242 \ifDIRECTIONempty@DN@{#2}\else\DN@{#1}\fi \next@}}%
4243 \expandafter\next@\expandafter{\afterDIRECTION@}%
4244 \xyFN@\DIRECTION@}
4246 \xylet@\afterDIRECTION@=\empty
4247 \xynew@{if}\ifDIRECTIONempty@
4249 \xydef@\DIRECTION@{%
4250 \ifx \space@\next \expandafter\DN@\space{\xyFN@\DIRECTION@}%gobble spaces
4251 \else\ifx v\next \DN@ v{\DIRECTION@v}%
4252 \else\ifx \bgroup\next \let\next@=\DIRECTION@group

```

```

4253 \else\ifx (\next \DN@(\xyFN@DIRECTION@open{%)
4254 \else
4255 \DN@{\count@=8 %
4256 \afterDIAG{\ifnum\count@=8 \DN@{\DIRECTIONempty@true \xyFN@DIRECTION@i}%
4257 \else \DN@{\xy@{\dimen@=\xydashl@}\Directionfromdiag@}\fi \next@}}%
4258 \fi\fi\fi\fi \next@}
4260 \xydef@DIRECTION@open{%
4261 \ifx *\next \DN@*##1*{\DIRECTION@group{##1}}%
4262 \else \DN@{\xyerror@{(* <pos> *) expected}{ } \xyFN@DIRECTION@i}%
4263 \fi \next@}

```

Diagonal directions. It is particularly easy to set <diag>onal directions:

More to the point, <diag>onals are stored internally as

Expanding `\afterDIAG{<stuff>}<diag>` will result in `\count@` being set to the <diag> code (not changed in case the <diag> is <empty>) before expanding <stuff>.

```

4304 \def\afterDIAG#1{\def\afterDIAG@{#1}\xyFN@DIAG@}
4306 \xydef@DIAG@{%
4307 \ifx d\next \DN@ d{\count@=1 \xyFN@DIAG@@}%
4308 \else\ifx r\next \DN@ r{\count@=3 \xyFN@DIAG@@}%
4309 \else\ifx u\next \DN@ u{\count@=5 \xyFN@DIAG@@}%
4310 \else\ifx l\next \DN@ l{\count@=7 \xyFN@DIAG@@}%
4311 \else \let\next@=\afterDIAG@
4312 \fi\fi\fi\fi \next@}
4314 \xydef@DIAG@@{\ifcase\count@ \or
4315 %\count@=1          3          5          7
4316 \DIAG@@@ l0r2\or\or \DIAG@@@ d2u4\or\or \DIAG@@@ r4l6\or\or \DIAG@@@ u6d0%
4317 \else\xybug@{impossible <diag> number}\fi
4318 \next@}
4320 \xydef@DIAG@@@#1#2#3#4{%
4321 \ifx #1\next \count@=#2\DN@#1{\afterDIAG@}%

```

```

4322 \else \ifx #3\next \count@=#4\DN@#3{\afterDIAG@}%
4323 \else \let\next@=\afterDIAG@ \fi\fi}

```

The action in case of a $\langle \text{diag} \rangle$ is simply to pick the right direction setup routine according to the encoding, getting the $\langle \text{diag} \rangle$ from $\backslash\text{count@}$ and the length of the d vector from $\backslash\text{dimen@}$:

```

4331 \xydef@\Directionfromdiag@{\ifcase\count@
4332   \xy@@{\dlDirection@\dimen@}%
4333 \or \xy@@{\dDirection@\dimen@}%
4334 \or \xy@@{\drDirection@\dimen@}%
4335 \or \xy@@{\rDirection@\dimen@}%
4336 \or \xy@@{\urDirection@\dimen@}%
4337 \or \xy@@{\uDirection@\dimen@}%
4338 \or \xy@@{\ulDirection@\dimen@}%
4339 \or \xy@@{\lDirection@\dimen@}%
4340 \or % 8 is legal and means change nothing
4341 \else\xybug@{impossible <diag>}\fi
4342 \DIRECTIONempty@false \xyFN@\DIRECTION@i}

```

Vector directions. Alternatively $v\langle \text{vector} \rangle$ sets the direction as if the connection from 0 to the $\langle \text{vector} \rangle$ had been typeset except that the *origin* is assumed zero such that directions $v(x,y)$ mean the natural thing, *i.e.*, is the direction of the connection from $(0,0)$ to (x,y) .

The action for a v reads a $\langle \text{vector} \rangle$ and sets the direction accordingly using some expansion hackery to propagate it out. The *origin* is cleared locally to make $v(x,y)$ behave as it should.

```

4363 \xydef@\DIRECTION@v{%
4364 \xy@{v}{\enter@{\cfromthec@ \X@origin=\the\X@origin \Y@origin=\the\Y@origin
4365   \X@p=\the\X@p \Y@p=\the\Y@p}%
4366   \X@origin=\z@ \Y@origin=\z@}%
4367 \afterVECTORrorEMPTY
4368   {\xy@@{\X@p=\z@ \Y@p=\z@ \setupDirection@ \leave@}%
4369   \DIRECTIONempty@false \xyFN@\DIRECTION@i}%
4370   {\xy@@\leave@ \xyerror@{<vector> expected after v}{}}%
4371   \DIRECTIONempty@false \xyFN@\DIRECTION@i}

```

Complex direction. In case the direction is not as simple, you can construct $\{ \langle \text{pos} \rangle \langle \text{decor} \rangle \}$ that sets up p and c such that \overline{pc} has the desired direction. **Note:** that you must use the $(*...*)$ form if this is to appear in an object $\langle \text{modifier} \rangle$!

The code for this is rather like the one for $\langle \text{vector} \rangle$ s.

```

4388 \xydef@\DIRECTION@group#1{%
4389 \xy@@{\begingroup}\xy@@ix@{#1}\xy@@{\plainxy@\expandafter\POS\the\toks9\relax
4390   \setupDirection@edef\next@{\endgroup \DirectionfromtheDirection@}\next@}%
4391 \DIRECTIONempty@false \xyFN@\DIRECTION@i}

```

Exercise 1.12: What effect is achieved by using $\langle \text{modifier} \rangle$ s $v/1pc/$ and $v/-1pc/?$ (p.578)

1.4m. Once the initial direction is established as either the last one or an absolute one then the remainder of the $\langle \text{direction} \rangle$ is interpreted.

Adding a single \wedge or $_$ denotes the result of rotating the default direction a right angle in the positive and negative direction, *i.e.*, anti-/clockwise, respectively. **Note:** Do *not* use $\wedge\wedge$ but only $_$ to reverse the direction!

A trailing $\langle\text{vector}\rangle$ is like $v\langle\text{vector}\rangle$ but uses the $\langle\text{direction}\rangle$ to set up a standard square base such that $\langle(0,1)\rangle$ and $\langle(0,-1)\rangle$ mean the same as $\langle a(90)\rangle$ and $\langle a(-90)\rangle$ and as \wedge and $_$, respectively.

```

4421 \xydef@DIRECTION@i{%

```

Exercise 1.13: What effect is achieved by using $\langle\text{modifier}\rangle s v/1pc/\langle(1,0)\rangle$ and $v/-1pc/_$? (p.578)

1.5 Decorations

```
4461 \message{decorations;}
```

$\langle\text{Decor}\rangle$ ations are actual $\text{T}_{\text{E}}\text{X}$ macros that decorate the current picture in manners that depend on the state. They are allowed *after* the $\langle\text{pos}\rangle$ ition either of the outer $\xy\dots\endxy$ or inside $\{\dots\}$. The possibilities are given in figure 1.6 with notes below.

Most options add to the available $\langle\text{decor}\rangle$, in particular the $v2$ option loads many more since $\text{X}_{\text{Y}}\text{-pic}$ versions prior to 2.7 provided most features as $\langle\text{decor}\rangle$.

Simple decorations: $\backslash\text{POS}$ and $\backslash\text{afterPOS}$ have already been defined; the following are just simple applications of previously defined commands:

```

4538 \xydef@Ddrop#1#\DN@##1{\xy@@ix@{\#1}{##1}}%
4539 \xy@{\Ddrop#1{##1}}{\expandafter\drop@the\toks9 }\ignorespaces}\next@}
4541 \xydef@Dconnect#1#\DN@##1{\xy@@ix@{\#1}{##1}}%
4542 \xy@{\Dconnect#1{##1}}{\expandafter\connect@the\toks9 }\ignorespaces}\next@}
4544 \xydef@Dpreconnect#1#\DN@##1{\xy@@ix@{\#1}{##1}}%
4545 \xy@{\Dconnect#1{##1}}{\expandafter\preconnect@the\toks9 }\ignorespaces}\next@}

```

Syntax	Action
$\langle\text{decor}\rangle \rightarrow \langle\text{command}\rangle \langle\text{decor}\rangle$ $\langle\text{empty}\rangle$	either there is a command... ... or there isn't.
$\langle\text{command}\rangle \rightarrow \backslash\text{save} \langle\text{pos}\rangle$ $\backslash\text{restore}$ $\backslash\text{POS} \langle\text{pos}\rangle$ $\backslash\text{afterPOS} \{ \langle\text{decor}\rangle \} \langle\text{pos}\rangle$ $\backslash\text{drop} \langle\text{object}\rangle$ $\backslash\text{connect} \langle\text{object}\rangle$ $\backslash\text{relax}$ $\langle\text{T}\text{E}\text{X} \text{ commands}\rangle$	save state ^{1.5a} , then do $\langle\text{pos}\rangle$ restore state ^{1.5a} saved by matching $\backslash\text{save}$ interpret $\langle\text{pos}\rangle$ interpret $\langle\text{pos}\rangle$ and then perform $\langle\text{decor}\rangle$ drop $\langle\text{object}\rangle$ as the $\langle\text{pos}\rangle$ * operation connect with $\langle\text{object}\rangle$ as the $\langle\text{pos}\rangle$ ** operation do nothing
$\backslash\text{xyverbose} \backslash\text{xytracing} \backslash\text{xyquiet}$	tracing ^{1.5c} commands
$\backslash\text{xyignore} \{ \langle\text{pos}\rangle \langle\text{decor}\rangle \}$	ignore ^{1.5d} XY -code
$\backslash\text{xycompile} \{ \langle\text{pos}\rangle \langle\text{decor}\rangle \}$	compile ^{1.5e} to file $\langle\text{prefix}\rangle\langle\text{no}\rangle.\text{xyz}$
$\backslash\text{xycompileto} \{ \langle\text{name}\rangle \} \{ \langle\text{pos}\rangle \langle\text{decor}\rangle \}$	compile ^{1.5e} to file $\langle\text{name}\rangle.\text{xyz}$

Figure 1.6: $\langle\text{decor}\rangle$ ations.

Notes

1.5a. Saving and restoring allows ‘excursions’ where lots of things are added to the picture without affecting the resulting XY -pic state, *i.e.*, c , p , and $base$, and without requiring matching $\{ \}$ s. The independence of $\{ \}$ is particularly useful in conjunction with the $\backslash\text{afterPOS}$ command, for example, the definition

```
\def\ToPOS{\save\afterPOS{%
  \POS**{?}>*@2{>}**@{-}\restore};p,}
```

will cause the code $\backslash\text{ToPOS}\langle\text{pos}\rangle$ to construct a double-shafted arrow from the current object to the $\langle\text{pos}\rangle$ (computed relative to it) such that $\backslash\text{xy} * \{A\} \backslash\text{ToPOS} + \langle 10\text{mm}, 2\text{mm} \rangle \backslash\text{endxy}$ will typeset the picture $A \longrightarrow$.

Note: Saving this way in fact uses the same state as the $\{ \}$ ‘grouping’, so the code $p_1, \{p_2\backslash\text{save}\}, \dots \{ \backslash\text{restore} \}$ will have $c = p_1$ both at the ... and at the end!

```
4583 \xydef@\save{\relax\saveC}
```

```
4584 \xydef@\saveC{\xy@\save\save@ \POS}
```

```
4586 \xydef@\save@{\enter@{\cfromthec@ \pfromthep@ \basefromthebase@}}
```

```
4588 \xydef@\restore{\xy@\restore\leave@ \ignorespaces}
```

1.5b. One very tempting kind of TEX commands to perform as $\langle\text{decor}\rangle$ is arithmetic operations on the XY -pic state. This will work in simple XY -pictures as described here but be warned: *it is not portable* because all XY -pic execution is indirect, and this is used by several options in nontrivial ways. Check the TEX -nical documentation [17] for details about this!

Macros that expand to $\langle\text{decor}\rangle$ will always do the same, though.

T_EX hackers like the author may enjoy changing the X_Y-pic state directly using `<decor>` of the form `\xy@{<id>}{<code>}`...

- 1.5c. `\xyecho` will turn on echoing of all interpreted X_Y-pic `<pos>` characters. **Bug:** Not completely implemented yet. `\xyverbose` will switch on a tracing of all X_Y-pic commands executed, with line numbers. `\xytracing` traces even more: the entire X_Y-pic state is printed after each modification. `\xyquiet` restores default quiet operation.

The trick is to replace the `\xy@` command such that it calls the ‘normal’ one between writing out a trace message and the state.

```

4626 \xydef@ \xyecho{%
4627 \xy@ \xyecho{\let \xy@=\xyecho@ \message{\string \xyecho}}\POS}

4629 \xydef@ \xyecho#1#2{{\def \1{#1}\ifx \1 \empty\else \message{\codeof \1}\fi}%
4630 \oxy@{#1}{#2}}

4632 \xydef@ \xyverbose{%
4633 \xy@ \xyverbose{\let \xy@=\xyverbose@
4634 \W@{Xy: \string \xyverbose \xytracelineno@}}\POS}

4636 \xydef@ \xyverbose#1#2{%

4666 \xydef@ \xyquiet{\xy@ \xyquiet{\let \xy@=\oxy@}}

```

- 1.5d. Ignoring means that the `<pos>` `<decor>` is still parsed the usual way but nothing is typeset and the X_Y-pic state is not changed.

We ignore in a group to ensure that nothing done inside ‘leaks’ to the outside.

```

4682 \xydef@ \xyignore#1{\xy@ \xyignore{\xyignore@{#1}}\ignorespaces}

```

```
4684 \xydef@xyignore@#1{\let\xy@=\xyeat@ \change@oxy@\xy@ \POS#1\relax}}
4686 \xydef@xyeat@#1#2{}
```

1.5e. It is possible to save an intermediate form of commands that generate parts of an Xy -picture to a file such that subsequent typesetting of those parts is significantly faster: this is called *compiling*. The produced file contains code to check that the compiled code still corresponds to the same $\langle\text{pos}\rangle\langle\text{decor}\rangle$ as well as efficient Xy -code to redo it; if the $\langle\text{pos}\rangle\langle\text{decor}\rangle$ has changed then the compilation is redone.

There are two ways to use this. The direct is to invent a $\langle\text{name}\rangle$ for each diagram and then embrace it in `\xycompileto{<name>}{...}` – this dumps the compiled code into the file $\langle\text{name}\rangle.xyc$.

When many diagrams are compiled then it is easier to add `\xycompile{...}` around the $\langle\text{pos}\rangle\langle\text{decor}\rangle$ to be compiled. This will assign file names numbered consecutively with a $\langle\text{prefix}\rangle$ which is initially the expansion of `\jobname-` but may be set with

```
\CompilePrefix{<prefix>}
```

This has the disadvantage, however, that if additional compiled Xy -pictures are inserted then all subsequent pictures will have to be recompiled. One particular situation is provided, though: when used within constructions that typeset their contents more than once (such as most $\mathcal{A}\mathcal{M}\mathcal{S}\text{-}\mathcal{L}\mathcal{A}\mathcal{T}\mathcal{E}\mathcal{X}$ equation constructs) then the declaration

```
\CompileFixPoint{<id>}
```

can be used inside the environment to fix the counter to have the same value at every passage.

It is done by just writing all Xy -commands to the file. The file establishes the correct input mode through use of the appropriate commands itself.

```
4738 \xydef@xycompile@@{\jobname-}
4739 \xydef@xycompileno@@{0}
4741 \xydef@CompilePrefix#1{%
4742 \def\xycompile@@{#1}\xdef\xycompile@@{\codeof\xycompile@@}%
4743 \xdef\xycompileno@@{0}}
4745 \xydef@xycompile{%

4796 \xywarnifdefined\xycomment@
4797 {\catcode'\%=12 \catcode'\(=1 \catcode'\)=2 \gdef\xycomment@(%)}

```

Hack1: The \ifxysaving@ can never be locally switched off! Anyway it is used to allow a gross hack avoiding building a queue in the matrix option that will generate too long lines!!

Hack2: \xysave@@toksix@ is not doing the catcode jive because it can never be invoked while loading a file (knock, knock ☺).

The initial command in all .xyc files check that this is the right file and that neither the version of Xy-pic nor the user's code has changed:

```

4812 \xydef\xycompiled#1#2#3#4{\DN@{#1}\edef\next@{\codeof\next@}%
4813 \ifx\next@\compilename@\else
4814 \xywarning@{This file does not contain the result of
4815 \string\xycompileto{\compilename@}{...}^^J%
4816 but of \string\xycompileto{\next@}\fi
4817 \edef\next@{Xy-pic \xyversion}\DN@{#3}\ifx\next\next@
4818 \DN@{#4}\ifx\next@\nextii@ \xycatcodes \outlines@\relax\readoutline@
4819 \else \def\xyrecompile@{recompiling to}\endinput \fi
4820 \else \def\xyrecompile@{Xy-pic version change - recompiling}\endinput \fi}
4822 \xydef\xyendcompiled{\let\xyrecompile@=\relax \xyuncatcodes\endinput}

```

Finally the fix-point thing.

```

4828 \xydef\CompileFixPoint#1{%
4829 \expandafter\ifx\curname#1FIX@\endcurname\relax

```

```

4830 \expandafter\xdef\csname#1FIX@\endcsname{\xycompileno@}%
4831 \else
4832 \xdef\xycompileno@{\csname#1FIX@\endcsname}\fi}

```

Finally, when many ‘administrative typesetting runs’ are needed, *e.g.*, readjusting L^AT_EX cross references and such, then it may be an advantage to not typeset any X_Y-pictures at all during the intermediate runs. This is supported by the following declarations which for each compilation creates a special file with the extension `.xyd` containing just the size of the picture:

```

\MakeOutlines
\OnlyOutlines
\ShowOutlines
\NoOutlines

```

The first does no more. The second uses the file to typesets a dotted frame of the appropriate size instead of the picture (unless the picture has changed and is recompiled, then it is typeset as always and the `.xyd` file is recreated for subsequent runs). The third shows the outlines as dotted rectangles. The last switches outline processing completely off.

The implementation is all handled by `\outlines@` which is called at strategic places in the compilation macros above. It just expands to nothing when the state is ‘No’, the first argument when it is ‘Make’, and the second when it is ‘Only’.

```

1.6 Kernel object library

```
4922 \message{kernel objects:}
```

In this section we present the *library objects* provided with the kernel language—several options add more library objects. They fall into three types: Most of the kernel objects (including all those usually used with ****** to build connections) are *directionals*, described in §1.6.1. The remaining kernel library objects are *circles* of §1.6.2 and *text* of §1.6.3.

1.6.1 Directionals

```
4940 \message{directionals,}
```

The kernel provides a selection of *directionals*: objects that depend on the current direction. They all take the form

$$\backslash\text{dir}\langle\text{dir}\rangle$$

to typeset a particular $\langle\text{dir}\rangle$ ectional object. All have the structure

$$\langle\text{dir}\rangle \longrightarrow \langle\text{variant}\rangle\{\langle\text{main}\rangle\}$$

with $\langle\text{variant}\rangle$ being $\langle\text{empty}\rangle$ or one of the characters \wedge_{23} and $\langle\text{main}\rangle$ some mnemonic code.

We will classify the directionals primarily intended for building connections as *connectors* and those primarily intended for placement at connection ends or as markers as *tips*.

Figure 1.7 shows all the $\langle\text{dir}\rangle$ ectionals defined by the kernel with notes below; each $\langle\text{main}\rangle$ type has a line showing the available $\langle\text{variant}\rangle$ s. Notice that only some variants exist for each $\langle\text{dir}\rangle$ —when a nonexistent variant of a $\langle\text{dir}\rangle$ is requested then the $\langle\text{empty}\rangle$ variant is used silently. Each is shown in either of the two forms available in each direction as applicable: connecting a \bigcirc to a \square (typeset by ****** $\backslash\text{dir}\langle\text{dir}\rangle$) and as a tip at the end of a dotted connection of the same variant (*i.e.*, typeset by the $\langle\text{pos}\rangle$ ****** $\backslash\text{dir}\langle\text{variant}\rangle\{.\}$ **??** ***** $\backslash\text{dir}\langle\text{dir}\rangle$).

As a special case an entire $\langle\text{object}\rangle$ is allowed as a $\langle\text{dir}\rangle$ by starting it with a *****: $\backslash\text{dir}^*$ is equivalent to $\backslash\text{object}$.

Setup: $\backslash\text{dir}$ starts an $\langle\text{object}\rangle$ and passes control to a ‘finisher’ named $\backslash\text{dir}\langle\text{variant}\rangle\{\langle\text{main}\rangle\}$ otherwise to the one corresponding to an $\langle\text{empty}\rangle$ $\langle\text{variant}\rangle$. The kernel ones described here have in common that they make use of the generic $\backslash\text{straight}$ defined in §1.8.3.

```

```

Notes

1.6a. You may use `\dir{}` for a “dummy” directional object (in fact this is used automatically by `**{}`). This is useful for a uniform treatment of connections, *e.g.*, making the ? (pos) able to find a point on the straight line from p to c without actually typesetting anything.

Uses an empty dropping, the `\no@@` connection. All the variants are defined for optimisation reasons and it is also named `\dir{ }` to allow spurious spaces:

```

5077 \xydefcsname@{dir{}}{\no@}
5079 \xyletcsnamecsname@{dir0{}}{dir{}}
5080 \xyletcsnamecsname@{dir1{}}{dir{}}
5081 \xyletcsnamecsname@{dir^{}}{dir{}}
5082 \xyletcsnamecsname@{dir_{} }{dir{}}
5083 \xyletcsnamecsname@{dir2{}}{dir{}}
5084 \xyletcsnamecsname@{dir3{}}{dir{}}
5086 \xyletcsnamecsname@{dir{ }}{dir{}}
5088 \xydef@no@{\egroup \czeroEdge@ %\Invisible@false \Hidden@false %%%HACK?
5089 \def\Leftness@{.5}\def\Upness@{.5}%
5090 \def\Drop@@{\setbox\z@=\copy\voidb@x}\def\Connect@@{\no@@}}

```

1.6b. The *plain connectors* group contains basic directionals that lend themselves to simple connections.

The bulk of the code is in fact in the description of these. First each of the three types—lines, dots, and squiggles—then the code for doubling and tripling.

Lines: A single `\dir{-}` object is a dash in the current direction: build box with character C of the semidirectional `\xydashfont`; use the characters natural width w and construct a height/depth from $d = |\sin(\backslash\text{Direction})| \text{em}$ (where 1em is the dash length, *cf.* `xydash10.mf`) as follows:

C	L	R	D	U	<i>flip if</i>
0...30	0	w	0	d	$dY < 0$
31...63	0	w	d	0	$dY > 0$
64...95	0	w	d	0	$dX < 0$
96...127	0	w	0	d	$dX < 0$

where *flip* means shift the box opposite vertically and horizontally, *i.e.*, $(L, R, D, U) := (R, L, U, D)$, and then lower the box $D - U$.

Procedure: (1.5139) Compute d , (1.5140) set D, U , and flip condition, (1.5144) build box to get w, L, R , (1.5146) dump box that is flipped if condition holds, and (1.5155) finally setup the required parameters properly.

5160 \def\Drop@@{\styledboxz@}\def\Connect@@{\solid@}
5162 \xydef@ \line@@@{\xydashfont\SemiDirectionChar\}/}

```

Bug: `\line@` should allow the size of the object to be changed after typesetting—this should make `\Connect@@` do dashing. Hm.

As mentioned above a dash will ‘Connect’ to make lines by using rules when strictly horizontal or vertical. This is controlled by enabling or disabling the test `\ifjusthvtest@` discussed below.

```

5173 \xydef@\solid@{%
5174 %
5175 %\W@{SOLID}\xystatus@:%
5176 %
5177 \checkXy@rules@\solidhrule@\solidvrule@{\straight@\solidSpread@}

5179 \xydef@\checkXy@rules@#1#2#3{%
5180 \dimen@=\Y@c \advance\dimen@-\Y@p
5181 \ifjusthvtest@.05pt>\ifdim\dimen@<\z@-\fi\dimen@ \DN@{#1}%
5182 \else \dimen@=\X@c \advance\dimen@-\X@p
5183 \ifjusthvtest@.05pt>\ifdim\dimen@<\z@-\fi\dimen@ \DN@{#2}%
5184 \else \DN@{#3}\fi\fi \next@}

```

Finally, we give the algorithm for ‘spreading’ the dashes along a solid line: just add an extra dash so they always overlap (see §1.8.3 for a proper definition of the requirements to spreading).

```

5193 \xydef@\solidSpread@{\ifnum\z@<\count@@ \advance\count@@\@ne \fi}

```

By default X_Y-pic will typeset horizontal and vertical `\dir{-}` connections using T_EX rules. Unfortunately rules is the feature of the DVI format most commonly handled wrong by DVI drivers. Therefore X_Y-pic provides the `\decorations`

```
\NoRules
\UseRules
```

that will switch the use of such off and on.

They simply redefine the conditional used to select typesetting with rules in `\solid@` above:

```
5219 \xylet@\ifjusthvtest@=\ifdim
```

```
5221 \xydef@\NoRules{\let\ifjusthvtest@=\iffalse}
```

```
5222 \xydef@\UseRules{\let\ifjusthvtest@=\ifdim}
```

The actual typesetting essentially means calling `\drop@` to box with a rule of the appropriate length and with line width set to that of `\xydashfont` (as stored in `\xydashw@`).

```

Dots: \dir{.} creates a very boring dot when used as an ⟨object⟩, but interesting dotted lines when used to connect. \zerodot should expand to a zero-sized box with a dot (initialised to use

`\zerodotbox@`); the `<object>` is built using `\pointlike@ <text> <spread-dimen>` that we will use again later.

```

5328 \xydef@zerodot{\copyzerodotbox@}
5330 \xydefcsname@{dir1{.}}{\point@}
5331 \xydefcsname@{dir2{.}}{\point@ \double@xydashh@}
5332 \xydefcsname@{dir3{.}}{\point@ \triple@xydashh@}
5333 \xyletcsnamecsname@{dir0{.}}{dir{}}
5334 \xyletcsnamecsname@{dir{.}}{dir1{.}}
5335 \xyletcsnamecsname@{dir{:}}{dir2{.}}

5337 \xydef@point@{\pointlike@zerodot\p@}

5339 \xydef@pointlike@#1#2{%
5340 \setboxz@h{#1}\wdz@=\z@ \ht\z@=\z@ \dp\z@=\z@ \boxz@\egroup
5341 % \Invisible@false \Hidden@false
5342 \def\Leftness@{.5}\def\Upness@{.5}\ctipEdge@
5343 \def\Drop@@@{\styledboxz@}\def\Connect@@{\straight@{\dottedSpread@{#2}}}}

```

This is reflected by the rather complicated spreading routine: ‘Dotting’ is the art of putting zero-sized objects together with equal distance independent of the chosen direction. So we must recompute the number of segments N (likely to be very big or -1) with trigonometry; using *radius* for the individual dots this becomes

```

1.5373          A := |\cos \Direction| \times radius
                B := |\sin \Direction| \times radius
1.5376          if A + B > |\d@X| + |\d@Y| then N = 0 and exit
1.5381          <A, B> := 2 \times <A, B>
                Filler := <box with the original filler centered...>
1.5384          <\d@X, \d@Y> := <\d@X, \d@Y> + <\sd@X \times A, \sd@Y \times B>
                <X, Y> := <X, Y> + <\sd@X \times A/2, \sd@Y \times B/2>
1.5386          N := [if |\d@X| > |\d@Y| then |\d@X|/A else |\d@Y|/B] + 1

```

as realised below:

```

5373 \xydef@dottedSpread@#1{%\setupDirection@
5374 \dimen@=#1\relax \DN@{\A@=2\A@ \B@=2\B@ \dottedSpread@i}%
5375 \A@=\sd@X\cosDirection\dimen@ \B@=\sd@Y\sinDirection\dimen@

5389 \ifdim\zz@\B@\else \divide\dimen@\B@ \fi \count@@=\dimen@
5390 \fi \advance\count@@\@ne}

```

A particular aspect of this is that we have to enlarge and recenter the actual box used for the typesetting (`\lastobjectbox@`).

Squiggles: These are just a lot of box maneuvering using the directional characters of `\xybsqlfont` (see `xybsql10.mf` for details):

```

5403 \xydefcsname@{dir1{~}}{\squiggle@}
5404 \xydefcsname@{dir2{~}}{\squiggle@ \double@\xybsqlh@}
5405 \xydefcsname@{dir3{~}}{\squiggle@ \triple@\xybsqlh@}

5421 \advance\count@-64 \ifnum\count@<\z@ \advance\count@128 \fi \char\count@}

```

The interesting bit is that they spread by not spreading, *i.e.*, by centering between the endpoints—this means

$$\begin{aligned}
 X &:= X - d/2, dX := dX - d \quad \text{where } d = \text{\sd@X}(|dX| - N \times A + .1\text{pt}) \\
 Y &:= Y - d/2, dY := dY - d \quad \text{where } d = \text{\sd@Y}(|dY| - N \times B + .1\text{pt})
 \end{aligned}$$

```

5436 \xydef@\squiggledSpread@{%
5437 \dimen@=\d@X \advance\dimen@-\sd@X\count@@\A@ \advance\dimen@\sd@X.3\p@
5438 \advance\X@c-.5\dimen@ \advance\d@X-\dimen@
5439 \dimen@=\d@Y \advance\dimen@-\sd@Y\count@@\B@ \advance\dimen@\sd@Y.3\p@
5440 \advance\Y@c-.5\dimen@ \advance\d@Y-\dimen@}

```

Double and triple directionals: As can be seen by the last two columns, these (and most of the other connectors) also exist in double and triple versions with a 2 or a 3 prepended to the name. For convenience `\dir{=}` and `\dir{:}` are synonyms for `\dir2{-}` and `\dir2{.}`, respectively; similarly `\dir{==}` is a synonym for `\dir2{--}`.

This is very simple, really: `\double@` and `\triple@` do the work by redefining the `\Drop@@` method to do its job twice and thrice. **To Do:** should probably extend any already defined `\Drop@@` method?

```

5462 %\xydef@\double@#1{\edef\Drop@@{\dimen@=#1\relax

```

Dashing directionals: First traditional dashing:

```

5498 \xydefcsname@{dir1{--}}{\dash@}
5499 \xydefcsname@{dir2{--}}{\dash@ \double@\xydashh@}
5500 \xydefcsname@{dir3{--}}{\dash@ \triple@\xydashh@}
5501 \xyletcsnamecsname@{dir0{--}}{dir{}}
5502 \xyletcsnamecsname@{dir{--}}{dir1{--}}
5503 \xyletcsnamecsname@{dir{==}}{dir2{--}}

5505 \xydef@\dash@{\line@ \wdz@=2\wdz@ \ht\z@=2\ht\z@ \dp\z@=2\dp\z@
5506 \multiply\D@c\tw@ \multiply\U@c\tw@ \multiply\L@c\tw@ \multiply\R@c\tw@
5507 \def\Connect@@{\straight@\dashedSpread@}}

```

Since the dashes should reach the endpoints we do this:

$$\begin{aligned}
 & \text{if } N > 0 \text{ then } N := N + 1 \\
 & dX := dX + d/2 \text{ where } d = \sd@XA \\
 & dY := dY + d/2 \text{ where } d = \sd@YB \\
 & \text{if } dX > 0 \text{ then } X := X + A/2 \\
 & Y := Y + \sd@YA/2
 \end{aligned}$$

```

5521 \xydef@\dashedSpread@{\ifnum\z@<\count@@ \advance\count@@\@ne \fi
5522 \advance\d@X\sd@X.5\A@ \advance\d@Y\sd@Y.5\B@
5523 \ifdim\z@<\d@X \advance\X@c.5\A@ \fi \advance\Y@c\sd@Y.5\B@}

```

Dashed dashing of squiggled lines are simpler since squiggles are symmetric:

```

5530 \xydefcsname@{dir1{~~}}{\dashsquiggle@}
5531 \xydefcsname@{dir2{~~}}{\dashsquiggle@ \double@\xybsqlh@}
5532 \xydefcsname@{dir3{~~}}{\dashsquiggle@ \triple@\xybsqlh@}
5533 \xyletcsnamecsname@{dir0{~~}}{dir{}}

```

```

5534 \xyletcsnamecsname@{dir{~}}{dir1{~}}
5536 \xydef@dashesquiggle@{\squiggle@
5537 \multiply\D@c\tw@ \multiply\U@c\tw@ \multiply\L@c\tw@ \multiply\R@c\tw@
5538 \dimen@=\L@c \advance\dimen@\R@c \wdz@=\dimen@ \ht\z@=\U@c \dp\z@=\D@c
5539 \def\Connect@@{\straight@dashesquiggledSpread@}}

```

The spreading of squiggles is similarly simpler: we just shave 1/4 squiggle size of each end of the connection in order to eliminate the blank space at both ends:

```

5547 \xydef@dashesquiggledSpread@{\ifnum\z@<\count@@ \advance\count@@\one \fi
5548 \advance\X@c.5\A@ \advance\d@X.5\A@ \advance\Y@c.25\B@ \advance\d@Y.5\B@}

```

Finally “dashed dotting” synonyms:

```

5554 \xyletcsnamecsname@{dir1{.}}{dir{.}}
5555 \xyletcsnamecsname@{dir2{.}}{dir2{.}}
5556 \xyletcsnamecsname@{dir3{.}}{dir3{.}}
5557 \xyletcsnamecsname@{dir{.}}{dir1{.}}
5558 \xyletcsnamecsname@{dir{:}}{dir2{.}}

```

1.6c. The group of *plain tips* contains basic objects that are useful as markers and arrowheads making connections, so each is shown at the end of a dotted connection of the appropriate kind.

They may also be used as connectors and will build dotted connections. *e.g.*, `**@{>}` typesets

Exercise 1.14: Typeset the following two +s and a tilted square:

Hint: the dash created by `\dir{-}` has the length 5pt (here).

(p.578)

```

5602 \xylet@\ctipEdge@=\czeroEdge@

```

To Do: Change tips to have a tiny size of 2sp which may be taken as an indication that it is a tip (this can be used by some features, *e.g.*, ‘arrow’).

Arrow heads: The ones intended for single connections are just characters from `\xyatipfont` and `\xybtipfont`.

```

5615 \xydefcsname@{dir1{>}}{\tip@}
5616 \xydefcsname@{dir^{>}}{\atip@}
5617 \xydefcsname@{dir_{>}}{\btip@}
5618 \xyletcsnamecsname@{dir0{>}}{dir{>}}

```

Double and triple tips are realised by taking the two halves and ‘wringing them apart’; as the naming indicates they are meant to be put at the end of 2- and 3-connections. This is currently done the slightly hacky (but efficient) way of adding directly to `\DirectionChar`; maybe this should be using `\vDirection@`?

```

1.6d. These tips are combinations of the plain tips provided for convenience (and optimised for efficiency). New ones can be constructed using `\composite` and by declarations of the form

$$\backslash\newdir \langle dir \rangle \{ \langle composite \rangle \}$$

which defines `\dir⟨dir⟩` as the `⟨composite⟩` (see note 1.4d for the details).

`\newdir` is simple:

```

5802 \xydef@\newdir#1#\{\newdir@{#1}}
5804 \xydef@\newdir@#1#2#3{\xydefcsname@{dir#1{#2}}{\composite@{#3}}}

```

Then the somewhat more efficient `\shiftdir@` used internally for moving a tip in the current direction—it does so by making a local `hbox` within which the argument tip is constructed and subsequently shifted and made of zero size. Use as

$$\backslash\shiftdir@ \langle tip@ \rangle \langle dimen \rangle \langle tip@ \rangle$$

where `⟨tip@⟩` means a tip command without the leading `\hbox{`.

```

5817 \xydef@\shiftdir@#1#2{%
5818 \setbox\z@=\hbox\bgroup#1\relax
5819 \setboxz@h{\dimen@ii=#2\relax
5820 \dimen@=-\cosDirection\dimen@ii \advance\dimen@-\L@c
5821 \kern\dimen@ \lower\sinDirection\dimen@ii\boxz@}}%
5822 \wdz@\z@ \ht\z@=\z@ \dp\z@=\z@ \boxz@}

```

Then the tips, with the `\tipjot@` hook allowing changing the spacing of tips used for single lines.

1.6.2 Circle segments

```
5979 \message{circles,}
```

Circle ⟨object⟩s are round and typeset a segment of the circle centered at the reference point. The syntax of circles is described in figure 1.8 with explanations below.

The `\cir` command is the hub: it parses the optional ⟨radius⟩ (to $\R@$, default from R_c) and $\{\langle\text{cir}\rangle\}$, bailing out with a `\zerodot` if the radius is too small:

```

5993 \xydef@\cir#1#\hbox\bgroup
5994 \afterVECTORorEMPTY{\xy@{\R@=\X@c}\cir@}{\xy@{\R@=\R@c}\cir@}#1@}
5996 \xydef@\cir@#1@#2{%

```

Syntax	Action
<code>\cir <radius> { <cir> }</code>	<code><cir></code> cle segment with <code><radius></code>
<code><radius></code> → <code><empty></code> <code><vector></code>	use R_c as the radius use X of the <code><vector></code> as radius
<code><cir></code> → <code><empty></code> <code><diag></code> <code><orient></code> <code><diag></code>	full circle of <code><radius></code> partial circle from first <code><diag></code> onal through to the second <code><diag></code> onal in the <code><orient></code> ation
<code><orient></code> → <code>^</code> <code>-</code>	anticlockwise clockwise

Figure 1.8: `<cir>`cles.

```

5997 \DN@{#1}\ifx\next@empty\else \xyerror@{illegal circle <radius>: must be
5998     <vector> or <empty>}}\fi
5999 \afterCIRorDIAG{\xyFN@cir@cir}{\xyFN@cir@diag}#2@}

```

The code to actually typeset the `<cir>` just parsed starts by checking that the `<cir>` was immediately followed by the `@` we put there in `\cir`:

```

6007 \xydef@cir@cir{%
6008 \ifx \space\next \expandafter\DN@\space{\xyFN@cir@cir}%gobble spaces
6009 \else \ifx @\next \DN@ @{\cir@i}%
6010 \else \xyerror@{illegal <cir>: must have form <diag><orient><diag> or
6011     <empty>}}}%
6012 \fi\fi \next@}

```

Similarly when an `<empty>` one was given—the parser will recognise this as a `<diag>` but we hack that here:

```

6019 \xydef@cir@diag{%
6020 \DN@{\xyerror@{illegal <cir>: must have form <diag><orient><diag> or
6021     <empty>}}}%
6022 \ifx @\next \ifnum\count@=8 %
6023     \DN@ @{\def\CIRin@{0}\def\CIRorient@{\CIRfull@}\def\CIRout@{7}\cir@i}%
6024 \fi\fi \next@}

```

... and then use the constructed methods to build it:

```

6030 \xydef@cir@i{%
6031 \ifnum\CIRin@=8 \xyerror@{incomplete <cir> specification}{%
6032 The <cir> you specified as <diag><orient><diag> is not sufficiently specific.}%
6033 \def\CIRin@{0}\fi
6034 \ifdim\R@<.5p@ \R@=\z@ \zerodot
6035 \else \CIRorient@ \cirbuild@ \fi
6036 \L@c=\R@ \R@c=\R@ \D@c=\R@ \U@c=\R@ \def\Leftness@{.5}\def\Upness@{.5}%
6037 \def\Drop@{\styledboxz}\def\Connect@{\straight@relax}%
6038 \Edge@c={\circleEdge}\OBJECT@x}

```

Parsing: The `\afterCIRorDIAG` parser handles the parsing: it either

- parses the $\langle \text{cir} \rangle$ and sets *in*, *orient*, and *out*, and passes control to the first argument continuation, or
- parses the single $\langle \text{diag} \rangle$ specified, store it in $\backslash \text{count} @$ (as 8 if an $\langle \text{empty} \rangle$ one given), and pass control to the second continuation argument,

where the $\langle \text{diag} \rangle$ internal representation number of note 1.4l of is used. An $\langle \text{empty} \rangle$ circle is treated as an $\langle \text{empty} \rangle$ diagonal; specifying an $\langle \text{empty} \rangle$ first $\langle \text{diag} \rangle$ of a $\langle \text{cir} \rangle$ is equivalent to using the value of the *in* method at call time.

The parser is very simple, setting methods stored in the usual $@@$ -terminated control sequences (**To Do**: Rename all non-method control sequences that end in $@@ \dots$ to use $@(\text{romannumeral})$ suffixes...):

```

6071 \xydef@CIRin@@{3}
6072 \xydef@CIRout@@{3}
6073 \xylet@CIRorient@@=\empty
6075 \xydef@afterCIRorDIAG#1#2{\def\afterCIR@{#1}\def\afterCIRDIAG@{#2}\xyFN@CIR@}
6077 \xylet@afterCIR@=\empty
6078 \xylet@afterCIRDIAG@=\empty
6080 \xydef@CIR@{\count@=8 \afterDIAG{\edef\CIRin@{\the\count@}\xyFN@CIR@@}}
6082 \xydef@CIR@@{%
6083 \ifx \space@next \expandafter\DN@space{\xyFN@CIR@@}%gobble spaces
6084 \else\ifx ^\next
6085 \DN@ ^{\def\CIRorient@@{\CIRacw@}%
6086 \afterDIAG{\edef\CIRout@@{\the\count@}\afterCIR@}}%
6087 \else\ifx _\next
6088 \DN@_{\def\CIRorient@@{\CIRcw@}%
6089 \afterDIAG{\edef\CIRout@@{\the\count@}\afterCIR@}}%
6090 \else
6091 \DN@{\def\CIRorient@@{\relax}\afterCIRDIAG@}%
6092 \fi\fi\fi \next@}

```

The default is to generate a *full circle* with the specified radius, *e.g.*,

$$\begin{array}{ll} \backslash \text{xy} * \text{cir} < 4 \text{pt} > \{ \} \backslash \text{endxy} & \text{typesets} \quad \text{“} \bigcirc \text{”} \\ \backslash \text{xy} * \{ M \} * \text{cir} \{ \} \backslash \text{endxy} & \quad \text{—} \quad \text{“} \textcircled{M} \text{”} \end{array}$$

All the other circle segments are subsets of this and have the shape that the full circle outlines.

Finally we present the *orient* methods. They use these ‘internal methods’ to actually draw the circles

```

6118 \xylet@CIRtest@@=\relax
6119 \xydef@CIRlo@@{0}
6120 \xydef@CIRhi@@{0}

```

Below we call them *lo*, *hi*, and *test*; the first two are coded as described in note 1.4l and the last takes two arguments: a dimension and something to do if the test succeeds. $\backslash \text{count} @@$ and $\backslash \text{count} @$ should be set to *in* and *out* internally as well in case $\backslash \text{cirbuild} @$ and friends below should be used.

The dummy *orient* used for simple circles is the simplest:

```

6132 \xydef@CIRfull@{\def\CIRtest@@##1##2{##2}}

```

The kernel $\backslash \text{cirbuild} @$ builds the actual $\langle \text{object} \rangle$ using characters from the $\backslash \text{xy} \text{circfont}$ assumed coded like $\text{xy} \text{circ} 10 . \text{mf}$: $\backslash \text{cirrestrict} @@$ chooses a group and adjusts the radius $\backslash R @$ to fit it exactly. The group is multiplied by 8 to get the group character offset $\backslash \text{count} @$.

```

6142 \xydef\cirbuild@{\cirrestrict@@ \multiply\count@8 %
6143 \circhar@0\circhar@7\kern\dimen@
6144 \circhar@1\circhar@6\kern\dimen@
6145 \circhar@2\circhar@5\kern\dimen@
6146 \circhar@3\circhar@4\kern\dimen@}

6148 \xydef\circhar@#1{%
6149 \setboxz@h{\circhar@@{#1}}\dimen@=\wdz@ \wdz@=\z@ \ht\z@=\R@ \dp\z@=\R@
6150 \CIRtest@@#1{\styledboxz@}\setbox\z@=\copy\voidb@x}

6152 \xydef\circhar@@#1{\xycircfont \advance\count@#1\relax \char\count@}}

```

`\cirrestrict@@` computes the group g [`\count@`] of circle segments to use from the radius r [`\R@`] using the formula (the reverse of the one in `xycirc10.mf`)

$$g = \begin{cases} \left\lfloor \frac{r}{1\text{pt}} \right\rfloor - 1 & \text{if } 1\text{pt} \leq r < 8\text{pt} \\ \left\lfloor \frac{r}{2\text{pt}} \right\rfloor + 3 & \text{if } 8\text{pt} \leq r < 16\text{pt} \\ \left\lfloor \frac{r}{4\text{pt}} \right\rfloor + 7 & \text{if } 16\text{pt} \leq r < 32\text{pt} \\ 15 & \text{if } 32\text{pt} \leq r \end{cases}$$

(where we know from `\cir@i` that $r \geq \frac{1}{2}\text{pt}$), and then adjusts the radius to be exactly the one chosen through the use of group g using the formula in `xycirc10.mf`...this is necessary because of the restriction on `tfm` files that they can only have 15 different nonzero heights and depths. Subsequent calls to `\cirrestrict@@` should compute the same values.

```

6175 \xydef\cirrestrict@@{\begingroup \dimen@=\R@

6188 \edef\@tmp{\endgroup \R@=\the\R@ \count@=\the\count@}\@tmp}

```

Partial circle segments with $\langle \text{orient} \rangle$ are the part of the full circle that starts with a tangent vector in the direction of the first $\langle \text{diag} \rangle$ onal (see note 1.4l) and ends with a tangent vector in the direction of the other $\langle \text{diag} \rangle$ onal after a clockwise (for `_`) or anticlockwise (for `^`) turn, *e.g.*,

<code>\xy*\cir<4pt>\l^r\endxy</code>	typesets	“  ”
<code>\xy*\cir<4pt>\l_r\endxy</code>	—	“  ”
<code>\xy*\cir<4pt>\dl^u\endxy</code>	—	“  ”
<code>\xy*\cir<4pt>\dl_u\endxy</code>	—	“  ”
<code>\xy*+{M}*\cir{dr_ur}\endxy</code>	—	“  ”

If the same $\langle \text{diag} \rangle$ is given twice then nothing is typeset, *e.g.*,

`\xy*\cir<4pt>\u^u\endxy` typesets “ ”

Special care is taken to setup the $\langle \text{diag} \rangle$ onal defaults:

- After \wedge the default is the diagonal 90° anticlockwise from the one before the \wedge .
- After $_$ the default is the diagonal 90° clockwise from the one before the $_$.

The $\langle \text{diag} \rangle$ before \wedge or $_$ is required for $\backslash \text{cir} \langle \text{objects} \rangle$.

Exercise 1.15: Typeset the following shaded circle with radius 5pt:

(p.579)

These two macros implement the defaults and setup of lo and hi for anticlockwise and clockwise segments. Here is what they set:

$\langle \text{cir} \rangle$	lo	hi	$test(s)$
$d_1 \wedge d_2, d_1 \leq d_2$	$d_1 -_8 1$	$d_2 -_8 1$	$lo \leq s \wedge s < hi$
$d_1 \wedge d_2, d_1 > d_2$	$d_2 -_8 1$	$d_1 -_8 1$	$s < lo \vee hi \leq s$
$d_1 _ d_2, d_1 < d_2$	$d_1 +_8 3$	$d_2 +_8 3$	$s < lo \vee hi \leq s$
$d_1 _ d_2, d_1 \geq d_2$	$d_2 +_8 3$	$d_1 +_8 3$	$lo \leq s \wedge s < hi$

where $+_8$ and $-_8$ are $+$ and $-$ modulo 8; d_1 and d_2 are in $\backslash \text{count}@@$ and $\backslash \text{count}@$, respectively.

```

1.6.3 Text

```

6316 \message{text;}

```

Text in pictures is supported through the `\object` construction

```
\txt <width> <style> {<text>}
```

that builds an object containing `<text>` typeset to `<width>` using `<style>`; in `<text>` `\\` can be used as an explicit line break; all lines will be centered. `<style>` should either be a font command or some other stuff to do for each line of the `<text>` and `<width>` should be either `<dimen>` or `<empty>`.

The code just parses the `<width>` defaulting it to `<\maxdimen>` which is recognised as ‘free form’.

```

1.7 Xy-pic options

Note: $\LaTeX 2_\epsilon$ users should also consult the paragraph on “xy.sty” in §1.1.1.

1.7.1 Loading

Xy-pic is provided with a growing number of options supporting specialised drawing tasks as well as exotic output devices with special graphic features. These should all be loaded using this uniform interface in order to ensure that the Xy-pic environment is properly set up while reading the option.

```
\xyoption { <option> }
\xyrequire { <option> }
```

`\xyoption` will cause the loading of an Xy-pic option file which can have one of several names. These are tried in sequence: `xy<option>.tex`, `xy<option>.doc`, `xy<short>.tex`, and `xy<short>.doc`, where `<short>` is `<option>` truncated to 6 (six) characters to conform with the TWG-TDS [19].

`\xyrequire` is the same except it is ignored if an option with the same name is already present (thus does not check the version etc.).

```

6407 \message{options;}
6409 \xylet@\xyoption@@=\relax
6411 \xydef@\xyoption#1{\DN@{#1}\edef\next@{\codeof\next@}%
6412 \csname xyeveryrequest@\next@ @\endcsname
6413 \xyinputorelse@{xy#1}{\xyoption@truncated#1@@@@@@@@, #1@}%
6414 \def\xyoption@#{1}\edef\xyoption@{\codeof\xyoption@}
6415 \expandafter\let\expandafter\next@\csname xy\xyoption@@ version\endcsname
6416 \expandafter\let\csname xy\xyoption@@ loaded\endcsname=\next@
6417 \runxywith@ \ignorespaces}

6419 \xydef@\xyoption@truncated#1#2#3#4#5#6#7#8, #9@{%
6420 \DN@{#7}\ifx\next@\empty \DN@##1##2{##2}\else\let\next@=\xyinputorelse@ \fi
6421 \next@{xy#1#2#3#4#5#6}%
6422 {\DN@{#1#2#3#4#5#6}\edef\next@{\codeof\next@}%
6423 \xyerror@{No '\next@' option}{%
6424 Your \xyoption{#9} request could not be granted: the required^^J%
6425 file 'xy#9.tex' could not be located. Please make sure that it is^^J%
6426 properly installed before continuing.}}

6428 \xydef@\xyrequire#1{\DN@{#1}\edef\next@{\codeof\next@}%
6429 \csname xyeveryrequest@\next@ @\endcsname
6430 \expandafter\let\expandafter\next@\csname xy\codeof\next@ loaded\endcsname
6431 \ifx \next@\relax \DN@{\xyoption{#1}}\else \DN@{\ignorespaces}\fi \next@

```

Sometimes some declarations of an option or header file or whatever only makes sense after some particular other option is loaded. In that case the code should be wrapped in the special command

```
\xywithoption { <option> } { <code> }
```

which indicates that if the `<option>` is already loaded then `<code>` should be executed now, otherwise it should be saved and if `<option>` ever gets loaded then `<code>` should be executed afterwards. **Note:** The `<code>` should allow more than one execution; it is saved with the catcodes at the time of the `\xywithoption` command.

```

6450 \xylet@\xywith@@=\empty
6452 \xydef@\runxywith@{\let\xywithdo@@=\xywithtest@ \xywith@@}
6454 \xydef@\xywithoption#1#2{\DN@{#1}\edef\next@{\codeof\next@}%
6455 \expandafter\let\expandafter\nextii@\csname xy\next@ loaded\endcsname
6456 \ifx \nextii@\relax
6457 \expandafter\def\expandafter\xywith@@\expandafter{\xywith@@
6458 \xywithdo@@{#1}{#2}}%
6459 \else \expandafter\xywithrun@\expandafter{\next@}{#2}\fi}
6461 \xydef@\xywithtest@#1#2{\DN@{#1}\edef\next@{\codeof\next@}%
6462 \ifx\next@\xyoption@@ \expandafter\xywithrun@\expandafter{\next@}{#2}\fi}
6464 \xydef@\xywithrun@#1#2{\csname xyeverywithoption@#1@\endcsname #2}

```

Finally, it is possible to declare `<code>` as some commands to be executed before every actual execution of `\xywithoption{<option>}{...}`, and similarly `<code>` to be executed before every `\xyoption{<option>}`

and `\xyrequire{<option>}` (collectively called ‘requests’):

```
\xyeverywithoption { <option> } { <code> }
\xyeveryrequest { <option> } { <code> }
```

This is most often used by an option to activate some hook every time it is requested itself.

These last two use the usual expansion trickery to define or append to the control sequences named `\xyeveryrequest@<option>@` and `\xyeverywithoption@<option>@` used in the definitions above.

```
6490 \xydef\xyevery@#1#2#3{\DN@{#2}\edef\next@{\codeof\next@}%
6491 \expandafter\ifx\csname xyevery#1@next@ @\endcsname\relax
6492 \expandafter\let\csname xyevery#1@next@ @\endcsname=\empty \fi
6493 \DNii@##1{\expandafter\def\expandafter##1\expandafter{##1#3}}%
6494 \expandafter\nextii@\csname xyevery#1@next@ @\endcsname}
6496 \xydef\xyeveryrequest{\xyevery@{request}}
6497 \xydef\xyeverywithoption{\xyevery@{withoption}}
```

1.7.2 Option file format

Option files must have the following structure:

```
%% <identification>
%% <copyright, etc.>

\ifx\xyloaded\undefined \input xy \fi

\xyprovide{<option>}{<name>}{<version>}%
      {<author>}{<email>}{<address>}

<body of the option>

\xyendinput
```

The 6 arguments to `\xyprovide` should contain the following:

`<option>` Option load name as used in the `\xyoption` command. This should be safe and distinguishable for any operating system and is thus limited to characters chosen among the lowercase letters (a–z), digits (0–9), and dash (-), and all options should be uniquely identifiable by the first 6 (six) characters only.

`<name>` Descriptive name for the option.

`<version>` Identification of the version of the option.

`<author>` The name(s) of the author(s).

`<email>` The electronic mail address(es) of the author(s) *or* the affiliation if no email is available.

`<address>` The postal address(es) of the author(s).

This information is used not only to print a nice banner but also to (1) silently skip loading if the same version was preloaded and (2) print an error message if a different version was preloaded.

The `\xyprovide` command checks that the option is not already loaded and that the loaded version is the same as the preloaded one by checking the existence and contents of the macro `\xy<option>loaded`. Finally it calls `\xycatcodes` such that the option internals are loaded in ‘ \TeX programming mode’. `\xyendinput` undoes this.

```

6565 \xydef@\xyprovide#1#2#3#4#5#6{%
6566 \def\xyoption@#{1}\edef\xyoption@{\codeof\xyoption@}\edef\next@{#3}%
6567 \message{ Xy-pic option: #2 v.\next@}%
6568 \expandafter\let\expandafter\nextii@\csname xy\xyoption@ loaded\endcsname
6569 \ifx \next@\nextii@ \message{not reloaded}\endinput
6570 \else
6571 \ifx \nextii@\relax\else \xyerror@{Option ‘\xyoption@’ version mismatch}{%
6572 You previously loaded, or the format has preloaded, a different version^^J%
6573 of this option. Just continue to try to load this version instead (and^^J%
6574 be prepared for a lot of warnings about redefinitions).}%
6575 \fi
6576 \expandafter\let\csname xy\xyoption@@ version\endcsname=\next@
6577 \expandafter\let\expandafter\xyenddocmode@\csname DOCMODE\endcsname
6578 \expandafter\let\csname DOCMODE\endcsname\xyprovidedocmode@
6579 \xycatcodes
6580 \fi \ignorespaces}
6582 \xydef@\xyendinput{\expandafter\let\csname DOCMODE\endcsname=\xyenddocmode@
6583 \message{loaded}\xyuncatcodes\endinput}

```

The above is further complicated because an option may be loaded in its DOCMODE form (ending in .doc). So we make sure that the mode that skips documentation, defined in the xy.tex file header, is active now.

```

6592 \expandafter\xylet@\expandafter\xyprovidedocmode@\csname DOCMODE\endcsname
6593 \xylet@\xyenddocmode@=\relax

```

The ‘dummy’ option described in §3.2 is a minimal option using the above features. It uses the special DOCMODE format to include its own documentation for this document (like all official Xy-pic options) but this is not a requirement.

1.7.3 Driver options

The <driver> options described in chapter 4 require special attention because each driver can support several extension options, and it is sometimes desirable to change <driver> or even mix the support provided by several.⁶

A <driver> option is loaded as other options with `\xyoption{<driver>}` (or through L^AT_EX 2_ε class or package options as described in §1.1.1). The special thing about a <driver> is that loading it simply declares the name of it, establishes what extensions it will support, and selects it temporarily. Thus the special capabilities of the driver will only be exploited in the produced DVI file if some of these extensions are also loaded and if the driver is still selected when output is produced. Generally, the order in which the options are loaded is immaterial. (Known exceptions affect only internal processing and are not visible to the user in terms of language and expected output.) In particular one driver can be preloaded in a format and a different one used for a particular document.

The following declarations control this:

```

\UseSingleDriver forces one driver only
\MultipleDrivers allows multiple drivers
\xyReloadDrivers resets driver information

```

The first command restores the default behaviour: that only one <driver> is allowed, *i.e.*, each loading of a <driver> option cancels the previous. The second allows consecutive loading of drivers such that

⁶The kernel support described here is based on the (now defunct) `xydriver` include file by Ross Moore.

when loading a \langle driver \rangle only the extensions actually supported are selected, leaving other extensions supported by previously selected drivers untouched. Beware that this can be used to create DVI files that cannot be processed by any actual DVI driver program!

The last command is sometimes required to reset the \XY-pic \langle driver \rangle information to a sane state, for example, after having applied one of the other two in the middle of a document, or when using simple formats like plain \TeX that do not have a clearly distinguished preamble.

Driver database. The main structure, the list of ‘loaded’ and ‘selected’ \langle driver \rangle s (ordered by age), is implemented as traditional \TeX ‘ \do-lists ’ (applications of $\text{\do}\{\langle$ driver $\rangle\}$ to each element).

```
6662 \xydef\xydriversloaded@none{\do{unload}}
6663 \xylet\xydriversloaded@@=\xydriversloaded@none
6664 \xylet\xydriversselected@@=\empty
```

This is used to provide entry points into a secondary structure that lists for each \langle driver \rangle the extensions supported by that driver. As should be apparent from the above, only the `unload` \langle driver \rangle is present initially: it represents the implementation technique used for the extension when no \langle driver \rangle is selected. Every extension must add an entry which reestablishes the default implementation of the extension:

```
6676 \xylet\xydriver@unload@support@@=\empty
```

All \langle driver \rangle s will have a similar structure named $\text{\xydriver}\langle$ driver \rangle `@support@@` which contains the extensions supported by that particular \langle driver \rangle : the ‘signature’ of each driver as \doii-list with two arguments (hence the `ii` ☺): the extension and the command to install the \langle driver \rangle -extension combination.

The two selection principles differ significantly. When only a single \langle driver \rangle is selectable then all extensions need to be unloaded *before* the selection. When multiple \langle driver \rangle s are allowed then only the added support needs to be executed.

```
6692 \xydef\selectdriver@#1{\DN@{#1}\edef\next@{\codeof\next@}%
6693 \expandafter\selectdriver@@\expandafter{\next@}}
6695 \xydef\selectdriver@single#1{\xysetup@@{\def\xydriversselected@@{\do{#1}}%
6696 \xyLoadDrivers@}\let\selectdriver@@=\changedriver@single}
6698 \xydef\changedriver@single#1{\xysetup@@{\def\xydriversselected@@{\do{#1}}%
6699 \xyReloadDrivers@}}
6701 \xydef\selectdriver@multiple#1{\expandafter\xysetup@@\expandafter{%
6702 \expandafter\def\expandafter\xydriversselected@@\expandafter{%
6703 \xydriversselected@@ \do{#1}}%
6704 \let\do=\activatedriver@ \xydriversselected@@}}
6706 \xydef\UseSingleDriver{\let\selectdriver@@=\selectdriver@single}
6707 \xydef\MultipleDrivers{\let\selectdriver@@=\selectdriver@multiple}
6709 \xydef\xyLoadDrivers@{\let\do=\activatedriver@ \xydriversselected@@}
6710 \xydef\xyReloadDrivers@{\activatedriver@{unload}\xyLoadDrivers@}
6711 \xylet\xyReloadDrivers=\xyReloadDrivers@
6713 \xydef\activatedriver@#1{%
6714 \let\doii=\activateddriversupport@ \csname xydriver@#1@support@@\endcsname}
6716 \xydef\activateddriversupport@#1#2{%
6717 \expandafter\ifx\csname xy#1loaded\endcsname\relax\DN@{}}%
6718 \else\DN@{#2}\fi \next@}
```

```
6720 \UseSingleDriver
```

Finally we define the following to get complete independence of load sequence: at every loading of an extension option known to be supported, we run through the list of presently selected drivers to activate any support for it, using the following:

```
6729 \xydef@ \xyselectoptionsupport@{\let\do=\activatedriver@ \xydriversselected@@}
```

As the above suggests it sometimes makes sense to load \langle driver \rangle s in the actual textual part of a document, however, it is recommended that only drivers *also* loaded in the preamble are reloaded later, and that `\xyReloadDrivers` is used when there is doubt about the state of affairs. In case of confusion the special command `\xyShowDrivers` will list all the presently supported and selected driver-extension pairs to the \TeX log.

```
6743 \xydef@ \xyShowDrivers{\W@{Loaded:}\let\do=\doShow \xydriversloaded@@
6744   \let\next@=\empty
6745   \def\do##1{\ifx\next@\empty \DN@{##1}%
6746     \else \expandafter\DN@\expandafter{\next@, ##1}\fi}%
6747   \xydriversselected@@\W@{Selected: \next@.}}
6749 \def\doShow#1{\let\next@=\empty
6750 \def\doii##1##2{\ifx\next@\empty \DN@{##1}%
6751   \else \expandafter\DN@\expandafter{\next@, ##1}\fi}%
6752 \csname xydriver@#1@support@@\endcsname
6753 \W@{ <driver> #1 supports \next@.}}
```

Driver internals. A \langle driver \rangle option files must have the following structure:

```
%% <identification>
%% <copyright, etc.>

\ifx\xyloaded\undefined \input xy \fi

\xyprovide{<option>}{<name>}{<version>}%
      {<author>}{<email>}{<address>}

\newdriver{%
\xyaddsupport{<extension>}{<cs>
:
}

<body of the <driver> option>

\xyendinput
```

There should be an `\xyaddsupport` command for each supported \langle extension \rangle which specifies the \langle cs \rangle (control sequence) with which the indicated support is *activated*.

The `\newdriver` command first establishes the ‘support’ list for the \langle driver \rangle (running the argument), then adds the \langle driver \rangle to the ‘loaded’ list, and finally selects it now and for every subsequent request of this \langle driver \rangle option.

It is important that the \langle cs \rangle that *activates* each driver/extension combination only does *rebinding of hooks*. In order to see what hooks are available for an extension, look for declarations of the form

```
\xyaddunsupport {<extension>} <cs>
```

and see what rebindings that `<cs>` does: those are the hokks. *because* they are the ones that will be safely reestablished! This should be adherede to because both activation and deactivation `<cs>`s may be executed many times.

The procedure is as follows: (1.6817) add the driver and clear its support control sequence unless it is already defined, (1.6823) execute the support commands, and (1.6824) setup to select it after loading.

```

6816 \xydef@newdriver#1{%
6817 \def\nextiii@##1{
6818 \expandafter\def\expandafter\xydriversloaded@@
6819 \expandafter{\xydriversloaded@@\do{##1}}%
6820 \expandafter\let\csname xydriver@\xyoption@@ @support@@\endcsname=\empty}%
6821 \def\do##1{\DNii@{##1}\ifx\xyoption@@\nextii@ \let\nextiii@=\eat@ \fi}%
6822 \xydriversloaded@@ \expandafter\nextiii@\expandafter{\xyoption@@}%
6823 #1\relax
6824 \DN@##1{\xywithoption{##1}{
6825 \selectdriver@{##1}\xyeveryrequest{##1}{\selectdriver@{##1}}}%
6826 \expandafter\next@\expandafter{\xyoption@@}\ignorespaces}

```

The support commands merely add to the support `\do`-lists which in turn (1.6853) adds `\doii{<extension>}{...}` to the `\xydriver@<driver>@support@@` control sequence and adds a check for when to apply it every time that `<extension>` is requested!

```

6836 \xydef@xyaddsupport{\expandafter\xyadddriverssupport@\expandafter{\xyoption@@}}

```

Driver related messages. Most extensions will print a warning when a capability is used which is not supported by the presently loaded <driver>. Such messages are only printed once, however, (for some formats they are repeated at the end). Similarly, when the support of an extension that exploits a particular <driver> is used a warning message will be issued that the DVI file is not portable.

This is implemented by defining a control sequence for each such warning and repeat it at the end. Warnings should be issued using one of

```
\xyununsupportwarning@ {<extension>} {<message>}
\xyununsupportwarning@ {<driver>} {<extension>}
```

```

1.8 Algorithms

This section presents the more complicated algorithms used in X_Y-pic.

1.8.1 Directions

```

6965 \message{algorithms: directions,}

```

The *direction state* is described by the following parameters:

<i>Direction</i>	‘angle’ of the direction on $] -4K \dots 4K]$ unit square
dX, dY	the vector $c - p$
sdX, sdY	sign of dX and dY
$\K@dXdY, \K@dYdX$	quotients $K \frac{dX}{dY}$ and $K \frac{dY}{dX}$ (as dimensions in sp)
<i>DirectionChar, SemiDirectionChar</i>	<code>\chardefs</code> for directional and semidirectional fonts
<i>cosDirection, sinDirection</i>	factors in the range $] -1 \dots 1]$ corresponding to \cos and \sin of <i>Direction</i>

where the “ $] -4K \dots 4K]$ unit square” has the following angles:

where the intermediate K angle in each interval correspond to equidistant points on the unit square. Thus only for $n \in \{-3, 2, 1, 0, 1, 2, 3, 4\}$ the angle of direction $n \times K$ is exactly $n \times 45^\circ - 135^\circ$ (0° being the direction straight right).

As usual `\DirectionfromtheDirection@` expands to code setting the current direction.

```

7005 \xydef@DirectionfromtheDirection@{\noexpand\Direction=\the\Direction
7006 \noexpand\d@X=\the\d@X \noexpand\d@Y=\the\d@Y
7007 \def\noexpand\sd@X{\sd@X}\def\noexpand\sd@Y{\sd@Y}%
7008 \noexpand\K@dXdY=\the\K@dXdY \noexpand\K@dYdX=\the\K@dYdX
7009 \chardef\noexpand\DirectionChar=\the\DirectionChar
7010 \chardef\noexpand\SemiDirectionChar=\the\SemiDirectionChar
7011 \def\noexpand\cosDirection{\cosDirection}%
7012 \def\noexpand\sinDirection{\sinDirection}%
7013 \noexpand\resetupDirection@}

```

The actual direction computation is done using `\setupDirection@`.

Procedure: Is really not so complicated. [1.7032] dX and dY are computed from $c - p$ and we skip if the current setting is based on these (this is stored in the internal `\Directiontest@@` method); [1.7035] if the direction is one of the principal ones then proceed with an optimised special case for those; otherwise proceed with the generic code.

```

7029 \xydef@\Directiontest@@#1#2{#2}
7031 \xydef@\setupDirection@{%
7032 \d@X=\X@c\advance\d@X-\X@p \d@Y=\Y@c\advance\d@Y-\Y@p
7033 \Directiontest@@\relax\setupDirection@i}
7035 \xydef@\setupDirection@i{\DN@{\setupDirection@ii}
7036 \ifdim\d@X=\d@Y
7037 \ifdim\zz@\d@Y \DN@{}}%
7038 \else\ifdim\d@X<\z@ \DN@{\dlDirection@{-1.4142\d@X}}}%
7039 \else \DN@{\urDirection@{1.4142\d@X}}\fi\fi
7040 \else\ifdim\d@X<\d@Y
7041 \ifdim\zz@\d@X \DN@{\uDirection@\d@Y}%
7042 \else\ifdim\zz@\d@Y \DN@{\lDirection@{-\d@X}}}%
7043 \else\ifdim-\d@X=\d@Y \DN@{\ulDirection@{-1.4142\d@X}}\fi\fi\fi
7044 \else
7045 \ifdim\zz@\d@X \DN@{\dDirection@{-\d@Y}}}%
7046 \else\ifdim\zz@\d@Y \DN@{\rDirection@\d@X}}%
7047 \else\ifdim\d@X=-\d@Y \DN@{\drDirection@{1.4142\d@X}}\fi\fi\fi
7048 \fi\fi \next@}

```

The procedures for the special (diag)onal cases are summarised in this table:

(diag)onal	<i>Direction</i>	$\cos(\textit{Direction})$, $\sin(\textit{Direction})$	$\textit{sign}(dX, dY)$	<i>Char</i>	<i>Semi</i>
dl	0	$-\sqrt{\frac{1}{2}}$, $-\sqrt{\frac{1}{2}}$	-, -	127	127
d	K	0, -1	+, -	15	31
dr	$2K$	$\sqrt{\frac{1}{2}}$, $-\sqrt{\frac{1}{2}}$	+, -	31	63
r	$3K$	1, 0	+, +	47	95
ur	$4K$	$\sqrt{\frac{1}{2}}$, $\sqrt{\frac{1}{2}}$	+, +	63	127
u	$-3K$	0, 1	+, +	79	31
ul	$-2K$	$-\sqrt{\frac{1}{2}}$, $\sqrt{\frac{1}{2}}$	-, +	95	63
l	$-K$	-1, 0	-, +	111	95

In each case the argument is used as the unit circle, *i.e.*, non-zero of dX and dY , and $\langle K \frac{dX}{dY}, K \frac{dY}{dX} \rangle := KK \times \langle dX, dY \rangle \dots$

```

```

Here is the procedure for the generic code.

- 1.7179 Make sign variables and slopes: $sdX := sign(dX)$, $sdY := sign(dY)$, $K \frac{dX}{dY} := sdX \times sdY \times [|KK \times dX| / |dY / KK|]$, and $K \frac{dY}{dX} := sdX \times sdY \times [|KK \times dY| / |dX / KK|]$, where the somewhat exotic computation method is used to ensure that the ‘native’ floor function provided by \TeX `\divide` can be used (it only acts predictably for positive numbers), that overflow is avoided even for large dX , dY , and that it is reasonable to use the convention of `\quotient@` that division by zero is like multiplying with one... Also takes care not to multiply too big dimensions with each other.
- 1.7196 If $-K \leq K \frac{dX}{dY} \leq K$ then the direction is mostly up or down: if $dY < 0$ [down, 1.7197]: $Direction := -K \frac{dX}{dY} + 1K$; else [up, 1.7199]: $Direction := -K \frac{dX}{dY} - 3K$.
- 1.7202 If $-K < K \frac{dY}{dX} < K$ then direction is mostly left or right: if $dX < 0$ [left, 1.7203]: $Direction := K \frac{dY}{dX} - K$; else [right, 1.7205]: $Direction := K \frac{dY}{dX} + 3K$.
- 1.7230 Compute character codes for direction and semidirection fonts. [1.7231]: $DirectionChar := (8K + Direction + K/32) \text{ div } (K/16) - 1$; while $DirectionChar > 127$: $DirectionChar - := 128$. [1.7234]: $SemiDirectionChar := (8K + Direction + K/64) \text{ div } (K/32) - 1$; while $SemiDirectionChar >$

127 : *SemiDirectionChar*− := 128. In both cases the 8*K* are added to ensure that \TeX will round down. **Hack:** The 16, $\backslash\text{KK}$, and 64 in these lines are really $K/64$, $K/32$, and $K/16$...

1.7237 Build *cosDirection* and *sinDirection* from appropriate characters in the $\backslash\text{xydashfont}$. [1.7237]:
cosDirection := $\text{wd}(\backslash\text{xydashfontSemiDirectionChar})$. [1.7239] $C := \text{SemiDirectionChar} - 64$, if
 $C < 0$: $C := C + 128$, *sinDirection* := $\text{wd}(\backslash\text{xydashfont}C)$.

1.7215 Register this dX, dY for next time.

1.8.2 Edges

An *Edge* is a token list describing the edge of an object. It must have the form $\{\langle\text{expandable token}\rangle\langle\text{unexpandable tokens}\rangle\}$. To find the edge of an object then first make it the current object and then do

```
\the\Edge@c\code
```

where $\langle\text{code}\rangle$ determines what should be done:

0 c is changed to be equal to the point on the edge intersecting with the line segment from p (for E $\langle\text{corner}\rangle$), also this was the v2.6 behaviour).

Note: This should not change any of A , B , or any component of the state except X_c and Y_c !

1 Test whether the center of p , *i.e.*, $\langle X_p, Y_p \rangle$, is ‘inside’ the c object (or on the edge). Sets the test `\ifInside@` accordingly.

2 Set `\dimen@` to the distance from the center to the edge towards p (as set with code 0).

Note: This is only positive in the direction towards p (thus negative-sized circles and rectangles make it negative).

3 c is changed to be equal to the point on the edge furthest in the direction towards p (for P $\langle\text{corner}\rangle$).

Note: This should not change any of A , B , or any component of the state except X_c and Y_c !

4 Replace c with rectangle with corners where the line from p intersects with the edge of c (thus this is the inner rectangle with corners as the current direction dictates).

5 Replace c with smallest rectangle that encloses the current object completely.

(if this reminds the reader of a ‘dictionary’ as used by object-oriented programming languages then they probably share this author’s regret that $\text{T}_{\text{E}}\text{X}$ is not object-oriented :-)

```

Non-centered variants: The code for the more general `\ellipseEdge` uses a Newton iteration to solve a quadratic equation.

First locate the actual centre of the ellipse and the lengths of the major axis a and minor axis b . Let (x, y) denote the displacement of the required edge point from the centre of the ellipse, so that $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$. Now let (dx, dy) be the displacement from the centre to the reference point; then $x = dx + s \cos \theta$ and $y = dy + s \sin \theta$ where s is the distance to (x, y) in the required direction θ . We must find the value of s , presumed to satisfy $s \geq 0$.

If $a < b$ we search for a root of

$$f\left(\frac{s}{a}\right) = \left(\tilde{d}x + \frac{s}{a} \cos \theta\right)^2 + \left(\tilde{d}y + \frac{s}{a} \frac{a}{b} \sin \theta\right)^2$$

$$f'\left(\frac{s}{a}\right) = 2\left(\tilde{d}x + \frac{s}{a} \cos \theta\right) \cos \theta + 2\left(\tilde{d}y + \frac{s}{a} \frac{a}{b} \sin \theta\right) \frac{a}{b} \sin \theta$$

where $\tilde{d}x = dx/a$ and $\tilde{d}y = dy/b$. By choosing a starting value $s_0 = 2a + 2b$ the Newton-iteration converges rapidly to the correct root, provided $b > 0$. If $a > b$ then we solve a similar quadratic in $\frac{s}{b}$.

To Do: The case of $a = 0$ or $b = 0$, so that the ellipse degenerates to a line segment, should be trapped earlier. Such an object would be more easily handled as a degenerate case of a rectangle.

To Do: In the case when the reference point lies outside the ellipse the Newton iteration is not guaranteed to converge. A simple test — s growing rather than decreasing in size — detects possible converge problems and exits the iteration. The following message is issued ...

Xy-pic warning: poor convergence.

Often, particularly when the reference point is on or near the edge of the ellipse, an acceptable approximation to the edge has been found anyway.

1.8.3 Connections

```
7859 \message{connections;}
```

Connections describe how a particular \langle object \rangle may be used to connect p to c . The following parameters and methods are defined by any connection; they should be used in the indicated sequence:

`\Invisible@@`, `\Hidden@@`, and `\Drop@@`: as for \langle object \rangle .

`\Creset@@`: (Re)set the connection parameters to allow use of the following to move to a point on the connection (this is what the interpretation of `<pos> ?` does first). All effects obtained by the following methods are undone: `\Creset@@` reestablishes the state to what it was just after the `\Connect@@` every time.

`\Cshavep@@` or `\Cshavec@@`: Change p or c to a zero-sized object at the start or finish of the connection (the first `<` and `>` `<place>` components).

`\Calong@@{<factor>}`: Move c to point the `<factor>` along the connection and set the direction parameters as a tangent to it in this point (the `<{<factor>}>` `<place>` component).

`\Cslidep@@{<dimen>}` or `\Csliddec@@{<dimen>}`: Move p or c the `<dimen>` dimension further in the current direction. Can be used both before and after the `\Calong@@` method (these handle subsequent `<` and `>` as well as the `/<slide>/` `<place>` component).

`\Cintercept@@`: Set c to a zerosized object at the point where the connection crosses the straight line from p to c (the `!{...}` `<place>` component).

`\Cbreak@@` and `\Clast@@`: These support typesetting of the connection in several ‘subsegments’ as used by the arrow option. The idea is the following, using the internal `lastbreak` and `nextbreak` positions:

1. `\Connect@@` sets `lastbreak := p` and `nextbreak := c`
2. The commands `\Csliddec@@`, `\Cslidep@@`, and `\Cintercept@@`, set `nextbreak` logically to the position that is obtained by the manipulation.
3. `\Cbreak@@` retypesets the connection except only the piece from `lastbreak` to the current c object, which *must* be at on top of `nextbreak`, is typeset. Afterwards it sets `lastbreak := nextbreak` and `nextbreak := c` (where c is the original c of the connection).
4. The command `\Clast@@` typesets from `lastbreak` and the remainder of the connection, and resets `lastbreak := p` and `nextbreak := c`.

Notice that it is not necessary for `nextbreak` to actually exist, in fact in the kernel it is just an alias for c at the time `\Cbreak@@` is called.

These are the defaults for basic `Xy`-pictures that only has straight connections hence the macros all starting with `\no...` are rather simple – in particular they just merge with zerosized objects at the locations cutoff locations (this was inherited from the broken `arrow` code ☺).

```

7974 \intersect@ \leave@}

```

And finally the dummy ‘break’ method which of course does nothing except the required shifting.

```

7981 \xydef@{\noCbreak@@{\edef\lastbreak@@{\cfromthec@}}
7982 \xydef@{\noClast@@{\Creset@@ \edef\lastbreak@@{\cfromthep@}}

```

The kernel only defines one kind of connection which is used by default: ‘filling’ many copies of the connect object on the straight line from p to c .

First the ‘dummy’ connection type `no` used for ⟨object⟩s where it doesn’t really make sense to ‘connect’, and used to provide defaults for easy operations:

```

7994 \xydef@{\no@@{\setupDirection@ \edef\lastbreak@@{\cfromthep@}%
7995 \enter@{\cfromthec@\pfromthep@\DirectionfromtheDirection@}%
7996 \edef\Creset@@{\cfromthec@ \pfromthep@ \DirectionfromtheDirection@}%
7997 \edef\next@{\sd@X}\sd@Y}\expandafter\straightcheckoverlap@\next@
7998 \setupDirection@ \the\Edge@c\z@
7999 \swap@\reverseDirection@\the\Edge@c\z@\swap@\reverseDirection@
8000 \resetDirection@
8001 \edef\Cshavep@@{\DirectionfromtheDirection@
8002 \pfromthep@\noexpand\resetDirection@}%
8003 \edef\Cshavec@@{\DirectionfromtheDirection@
8004 \cfromthec@\noexpand\resetDirection@}%
8005 \leave@
8006 \def\Cslidep@@{\noCslidep@@}\def\Cslidec@@{\noCslidec@@}%
8007 \def\Calong@@{\noCalong@@}\def\Cintercept@@{\noCintercept@@}%
8008 \def\Cbreak@@{\noCbreak@@}\def\Clast@@{\noClast@@}\noinsert@}

8010 \xydef@{\noinsert@{\ifHidden@}\else
8011 \ifdim\Y@c>\Y@max \Y@max=\Y@c \fi \ifdim\Y@p>\Y@max \Y@max=\Y@p \fi
8012 \ifdim\Y@c<\Y@min \Y@min=\Y@c \fi \ifdim\Y@p<\Y@min \Y@min=\Y@p \fi
8013 \ifdim\X@c>\X@max \X@max=\X@c \fi \ifdim\X@p>\X@max \X@max=\X@p \fi
8014 \ifdim\X@c<\X@min \X@min=\X@c \fi \ifdim\X@p<\X@min \X@min=\X@p \fi
8015 \fi}

```

Next ‘straight’ connections that use the following special parameters to customises how to repeat a ‘filler’ object as many times as needed to draw the connection:

`\lastobjectbox@`: box to fill with; assumed to be ‘trimmed’ to have only the size needed for the filler; size is $w \times (h + d)$.

The method is called as `\straight@{<spread>}` where `<spread>` is a macro to expand *after* the number of fillers N (in `\count@@`) is known and with $A = w$ and $B = d + h$ but *before* any filling is done. May change N as well as dX, dY, X, Y, w, d, h in order to affect the filling.

Procedure: [1.8054] setup direction parameters, clear the break state, and define the `\Creset@@` macro to reestablish this initial state; [1.8057] build macro to discover if the edges of the objects overlap (it edges were removed); [1.8065] move both p, c to the edges of the objects. . . and define the `\Cshave*@@` macros accordingly; [1.8066] choose either to ignore the connection if requested or there is overlap between the objects of choose either vbox or hbox version (see below). . . ; and [1.8071] build `\Calong@@`, `\Cbreak@@`, and `\Clast@@` macros, and reset pc .

Note: Assumes that the direction is not tampered with between `Creset` is defined and used. . .

```

8051 \xydef@\Spread@@{
8052 \xydef@\checkoverlap@@{

8054 \xydef@\straight@#1{\setupDirection@ \def\Spread@@{#1}%

8084 \else \DN@{\straightth@}%
8085 \fi\fi\fi\fi \checkoverlap@@ \next@}

```

The methods `\straightCbreak@` and `\straightClast@` implement the break method parametrised on the ‘typeset’ primitive which is usually `\straight@typeset` which is a simplified version of `\straight@` that does not initialise. This relies on the connection being straight: the `Cbreak@@` method executes $p, c := p.lastbreak, c.nextbreak$ and `Clast@@` executes $p, c := p.lastbreak, c$, where in both cases the `[Inner]` modifier is applied just before the merging to make sure the edge is respected by the merged object.

```

8099 \xylet@\nextbreak@@=\empty
8101 \xydef@\straightCbreak@{\connectRestore@
8102 \edef\nextbreak@@{\cfromthec}%

8117 \resetDirection@ \noinsert@ \straight@typeset
8118 \Creset@@ \edef\lastbreak@@{\cfromthep}}

```

Now for the typesetting – to summarise: these are parametrised on direction parameters and use X, Y : endpoint of connection (‘Direction end’). dX, dY : connection distance (‘Direction vector’). `\Leftness@` of `(object)`. `\lastobjectbox@` to fill with; assumed to be ‘trimmed’. `\Spread@@` to expand to modify the default spreading used. `\Drop@@` to expand to actually typeset the finished connection when it is in box0! **Note:** Must make box0 void to avoid ‘box leaks’.

Two variants exist: one for mostly horisontal and one for mostly vertical filling. We detail the ‘mostly horisontal’ one:

[1.8157] start box; [1.8159] compute initial adjustment (X right and Y up) and $A := w, B := h + d, N = \lfloor (|dX|/A) \rfloor$, and run user supplied `Spread`; [1.8163] adjust first filler position horizontally: if $dX > 0$ then $X := X - w$; [1.8164] adjust first filler vertically: $Y := Y - sdX \times L \times (dY/dX) \times w$ where $L = \text{if } dX > 0 \text{ then } (1 - \text{Leftness}) \text{ else } \text{Leftness}$; [1.8168] recompute the move dimensions (A right and B up): $A := -sdX(|dX| - w)/(N - 1), B := sdY|sdX(w) \times dY/dX - dY|/(N - 1)$, and set the filler box to have $w := A$; [1.8174] output first filler adjusted X, Y and the following $N - 1$ each A further right and raised B more than the previous; and finally end object with usual bravour!

```

Chapter 2

Extensions

This chapter describes the options that provide extensions to the kernel, *i.e.*, support facilities that are not obtainable using the kernel. Most such features are only approximated, relying on a driver for the implementation.

2.1 Curve and Spline extension

Vers. 3.11 by Ross Moore <ross.moore@mq.edu.au>

This option provides Xy-pic with the ability to typeset spline curves by constructing curved connections using arbitrary directional objects and by encircling objects similarly. *Warning:* Using curves can be quite a strain on TeX's memory; you should therefore limit the length and number of curves used on a single page. Memory use is less when combined with a backend capable of producing its own curves; *e.g.*, the POSTSCRIPT backend).

```

2.1.1 Curved connections

```
48 \message{curve,}
```

Simple ways to specify curves in \Xy-pic are as follows:

```

**\crv{⟨poslist⟩} curved connection
**\crvs{⟨dir⟩}   get ⟨poslist⟩ from the stack
\curve{⟨poslist⟩} as a ⟨decor⟩ation

```

in which $\langle\text{poslist}\rangle$ is a list of valid $\langle\text{pos}\rangle$ itions. The decoration form \curve is just an abbreviation for \connect\crv . As usual, the current p and c are used as the start and finish of the connection, respectively. Within $\langle\text{poslist}\rangle$ the $\langle\text{pos}\rangle$ itions are separated by $\&$. A full description of the syntax for \crv is given in figure 2.1.

We need a counter to track the number of control points, (i.e. the number of $\langle\text{pos}\rangle$ s in $\langle\text{poslist}\rangle$) and provide a macro to read it. Also a token list which will store the vital information for later use, to allow curved connections to work properly.

```

83 \xynew@{count}\crv@cnt@
84 \xydef@\xynumctrlpts@{\the\crv@cnt@}
85 \xynew@{toks}\crvpts@

```

If $\langle\text{poslist}\rangle$ is empty a straight connection is computed. When the length of $\langle\text{poslist}\rangle$ is one or two then the curve is uniquely determined as a single-segment Bézier quadratic or cubic spline. The tangents at p and c are along the lines connecting with the adjacent control point. With three or more $\langle\text{pos}\rangle$ itions a cubic B-spline construction is used. Bézier cubic segments are calculated from the given control points.

```

101 \xydef@\setcurve@{
102   \edef\xysplineparams@{
103     \expandafter\noexpand\csname params@\endcsname}%
104   \edef\xysplineedges@{
105     \expandafter\noexpand\csname edges@\endcsname}%

```

```

106 \edef\ycrcvcnt@{%
107 \expandafter\noexpand\csname crvcnt@\endcsname}%
108 \expandafter\edef\ycrcvcnt@{\number\crv@cnt@}%
109 \ifcase\crv@cnt@
110 \expandafter\ycvvhull@\or
111 \expandafter\xyquadbezier@\or
112 \expandafter\ycubicbezier@\or
113 \expandafter\xybspline@iii\or
114 \expandafter\xybspline@iv\else
115 \expandafter\xybspline@
116 \fi}

```

The previous picture was typeset using:

```

\xy (0,20)*+{A};(60,0)*+{B}
**\crv{}
**\crv{(30,30)}
**\crv{(20,40)&(40,40)}
**\crv{(10,20)&(30,20)&(50,-20)&(60,-10)}
\endxy

```

except for the labels, which denote the number of entries in the $\langle \text{poslist} \rangle$. (Extending this code to include the labels is set below as an exercise).

The ?-operator of §1.3 (note 1.3h) is used to find arbitrary $\langle \text{place} \rangle$ s along a curve in the usual way.

Exercise 2.1: Extend the code given for the curves in the previous picture so as to add the labels giving the number of control points. (p.579)

Using ? will set the current direction to be tangential at that $\langle \text{place} \rangle$, and one can $\langle \text{slide} \rangle$ specified distances along the curve from a found $\langle \text{place} \rangle$ using the $? \dots / \langle \text{dimen} \rangle /$ notation:

Exercise 2.2: Suggest code to produce something like the above picture; the spline curve is the same as in the previous picture. *Hints:* The line is 140pt long and touches 0.28 of the way from A to B and the x is 0.65 of the way from A to B. (p.579)

The positions in $\langle \text{poslist} \rangle$ specify *control points* which determine the initial and final directions of the curve—leaving p and arriving at c —and how the curve behaves in between, using standard spline constructions. In general, control points need not lie upon the actual curve.

A natural spline parameter varies in the interval $[0, 1]$ monotonically along the curve from p to c . This is used to specify $\langle \text{place} \rangle$ s along the curve, however there is no easy relation to arc-length. Generally the parameter varies more rapidly where the curvature is greatest. The following diagram illustrates this effect for a cubic spline of two segments (3 control points).

Exercise 2.3: Write code to produce a picture such as the one above. (*Hint:* Save the locations of places along the curve for later use with straight connections.) (p.579)

To have the same $\langle\text{pos}\rangle$ occurring as a multiple control point simply use a delimiter, which leaves the $\langle\text{pos}\rangle$ unchanged. Thus $\backslash\text{curve}\{\langle\text{pos}\rangle\&\}$ uses a cubic spline, whereas $\backslash\text{curve}\{\langle\text{pos}\rangle\}$ is quadratic.

Repeating the same control point three times in succession results in straight segments to that control point. Using the default styles this is an expensive way to get straight lines, but it allows for extra effects with other styles.

Curve Objects: At present the syntax is supported for using a $\backslash\text{curve}$ object only as a decoration, constructed from a $\backslash\text{crv}$ object used as a connection.

```
255 \xydef@\curve{\connect\crv}
```

The more general $\backslash\text{crv}$ object currently works as a connection. In future this object-type will be extended to allow closed curves as the boundaries of objects.

```
263 \xydef@\crv#1#\{\hbox \bgroup \crvresetbreaks@ \initshape@
264 \def\pure@crv{\crv@saveStyles@\crv@{#1}}
266 \xydef@\crv@#1#2{%
267 \DN@{#1}\ifx\empty\next@
268 \DN@{\def\afterCURVEaction@{\parsecurve@\xycurve@}}%
269 \else\DN@{\parseCURVE@#1\parsecurve@\curveSTYLE@}\fi
270 \next@ #2@\endcurve\endcrv@ }
272 \xydef@\curveSTYLE@{\xycurve@@}% default style
273 \xydef@\afterCURVEaction@{}% default after-curve action
274 \xydef@\@endcurve{}%
275 \xydef@\endcrv@@{\endcrv@\POS}%
276 \xydef@\pure@crv{\relax}
```

The $\backslash\text{@endcurve}$ inserted here ensures that subsequent parsing with $\backslash\text{checkendcurve@}$ (see below) will terminate cleanly.

The $\backslash\text{crvs}$ object has restricted functionality with choice of styles and is always used for curves only. It has a single braced argument which can be used to set curve styles. Its main use is for retypesetting different portions of the same curve, for example the subsegments of a curved arrow/path segment.

This is done by first examining $\backslash\text{bstartPLACE@}$. If $\backslash\text{relax}$ or undefined, then the curve is set using $\backslash\text{@crv@}$ to decide the style. If $\backslash\text{bstartPLACE@}$ is $\backslash\text{empty}$ then the curve is fully processed as a connection but nothing is actually typeset; this is used by curved arrows where the curve is first set as “invisible” before breaks and labels are processed. When $\backslash\text{bstartPLACE@}$ contains a number, normally within the range 0 to 1, this is interpreted as a $\langle\text{place}\rangle$ along a curved connection that has already been established. No typesetting may occur before this $\langle\text{place}\rangle$.

In this case the control point information is discarded since the curve can be recovered using `\splinereset@`. The current p and c are no longer the endpoints of the curve but are $\langle\text{pos}\rangle$ itions along the curve between which the typesetting should occur. The value of `\bstartPLACE@` is typically a $\langle\text{place}\rangle$ along the curve which is within the $\langle\text{pos}\rangle$ at p . It is used to help locate the edge of this $\langle\text{pos}\rangle$ where typesetting should commence. Similarly `\bendPLACE@` is typically a $\langle\text{place}\rangle$ along the curve which is within the $\langle\text{pos}\rangle$ at c .

Bug: this should use a `\Step@@` method to get the spacing for dotting; this will eliminate the need for templates...

Parsing: Two separate parsers are required: one for `\curve...`, the other for the contents of `{...}`.

Set `\curveSTYLE@` to be the default of `\xycurve@@` then examine the following tokens to see if this must be changed.

Set `\curveSTYLE@` to be the default of `\xycurve@@` then examine the following tokens to see if this must be changed.

Procedure: If the first token of #1 (from `\crv@`) is `~` then a letter should follow, determining how to set the style. If instead it is an active control sequence then issue a warning message, but let it do its thing anyway. However `\parsecurve@` is a normal thing to encounter, so no warning is required. Currently a single letter without the `~` will be recognised, but two-letter combinations definitely need the `~`.

Parsing of the ⟨poslist⟩ is quite simple, recognising few special tokens:

- \endcurve and \endxy terminate reading of control points.
- &, \ and \relax delimit ⟨pos⟩itions
- anything else is treated as a ⟨pos⟩, being handled by the \POS@ parser.

```
679 \xydef@\checkendcurve@{%

694 \xydef@\searchnextpt@{\afterPOS{\xy@@\addtocrv@ \xyFN@\checkendcurve@}}

```

There could be a problem in that an invalid token would cause an infinite loop, passing back and forth between `\checkendcurve@` and `\POS@`. This is avoided by setting a flag `\setsearchflag@` when the `\POS@` parser is called, not following a valid delimiter. Encountering a valid delimiter clears the flag. If `\checkendcurve@` is called with the flag set, a warning message is issued and the token is skipped; the flag remains set. Processing continues, but it is possible that the wrong number of positions will be read; presumably there is some kind of error that needs to be fixed anyway.

```

709 \xydef@\checkafterCURVE@{%
710 \edef\tmp@{\noexpand\xyFN@\noexpand\checkendcurve@ %
711 \afterCURVEaction@\noexpand\endcurve}\tmp@ }

```

The values of `\X@min`, `\X@max`, *etc.* are used to compute the extents `\L@c`, `\R@c`, *etc.* of the object. This information must be maintained after the group is closed, unless the “hidden” attribute is required or we are inside a matrix construction.

In calculating the size of the box containing the curve `\X@min`, `\X@max`, *etc.* are initialised to describe the minimum rectangle enclosing p and c . At the same time we save the current scope.

```

794 \xydef@\initshape@\savescope@

```

To Do: This can be improved. For example, trace along the spline until an appropriate point is

found. There may be more than one such point, so extra criteria may be required.

Notes

- 2.1a. The “drop” object is set once, then “dropped” many times at appropriately spaced places along the curve. If directional, the direction from p to c is used. Default behaviour is to have tiny dots spaced sufficiently closely as to give the appearance of a smooth curve. Specifying a larger size for the “drop” object is a way of getting a dotted curve (see the example in the next note).
- 2.1b. The “connect” object is also dropped at each place along the curve. However, if non-empty, this object uses the tangent direction at each place. This allows a directional object to be specified, whose orientation will always match the tangent. To adjust the spacing of such objects, use an empty “drop” object of non-zero size as shown here:

```
\xy (0,0)**{A}; (50,-10)**{B}
**\crv{~*=<4pt>{.} (10,10)&(20,0)&(40,15)}
**\crv{~*=<8pt>{ }~**!/-5pt/\dir{>}}(10,-20)
&(40,-15)} \endxy
```

When there is no “connect” object then the tangent calculations are not carried out, resulting in a saving of time and memory; this is the default behaviour.

- 2.1c. The “drop” and “connect” objects can be specified as many times as desired. Only the last specification of each type will actually have any effect. (This makes it easy to experiment with different styles.)
- 2.1d. Complicated diagrams having several spline curves can take quite a long time to process and may use a lot of T_EX’s memory. A convenient device, especially while developing a picture, is to show only the location of the control points or to join the control points with lines, as a stylized approximation to the spline curve. The $\langle\text{curve-option}\rangle$ s $\sim\text{p}$ and $\sim\text{l}$ are provided for this purpose. Uppercase versions $\sim\text{P}$ and $\sim\text{L}$ do the same thing but use any $\langle\text{curve-object}\rangle$ s that may be specified, whereas the lowercase versions use plain defaults: small cross for $\sim\text{p}$, straight line for $\sim\text{l}$. Similarly $\sim\text{C}$ and $\sim\text{c}$ set the spline curve using any specified $\langle\text{curve-option}\rangle$ s or as a (default) plain curve.
- 2.1e. Use of $\sim\text{p}$, $\sim\text{l}$, etc. is extended to enable both the curve and the control points to be easily shown in the same picture. Mixing upper- and lower-case specifies whether the $\langle\text{curve-option}\rangle$ s are to be applied to the spline curve or the (lines joining) control points. See the examples accompanying the next two notes.
- 2.1f. By default the control points are marked with a small cross, specified by $*\text{dir}\{\text{x}\}$. The “connect” object is ignored completely.

was typeset by ...

```
\xy (0,0)**{A};(50,-10)**{B}
**\crv~pC{~*=<\jot>{.}(10,-10)&(20,15)
&(40,15)} \endxy
```

2.1g. With lines connecting control points the default “drop” object is empty, while the “connect” object is `\dir{-}` for simple straight lines. If non-empty, the “drop” object is placed at each control point. The “connect” object may be used to specify a fancy line style.

was typeset by ...

```
\xy (0,0)**{A};(50,-10)**{B}
**\crv~Lc{~**\dir{--}~*{\oplus}
(20,20)&(35,15)} \endxy

Spline Methods Each `\curve` has to set the sliding abilities. This is done by a call to `\crvconnect@@` which gives values to the methods `\Creset@@`, `\Cshavep@`, etc. These values depend on the style of the curve itself.

```

1073 }

```

These are the actual methods.

Reset the spline parameters:

`\xycrvptsnum@`: expands to a control sequence, whose name incorporates the correct scoping level, giving the number of control points.

`\the\crvpts@`: reads the control point locations and other information from a token list.

`\xysplineparams@`: set to a control sequence name, incorporating the correct scoping level, which will allow access to the Bézier control points for each spline segment, when required.

`\xysplineedges@`: set to a control sequence name, incorporating the correct scoping level, which gives the spline parameters of the edges of objects at p and c ;

`\segmentnum@`: reset to 0.

`\splinecorrect@p` and `\splinecorrect@c`: reset to 0 until changed by a `\Cshavep@` or `\Cshavec@`.

`\splinelength@`: reset to 0 until changed by a `\Cshavep@`, `\Cshavec@` or `\Calong@`; this is needed by `\Cshavep@` and `\Cshavec@` to quickly locate where to slide from, especially when it is necessary to slide across more than a single spline segment.

`\splineplace@`: reset to .5.

```

1109 \xydef@\splinereset@{\the\crvpts@
1110 \edef\xycrvptsnum@{\csname ptsnum@\endcsname}%
1111 \edef\xysplineparams@{%

1116 \splinelength@=\z@ \def\splineplace@f{.5}%
1117 }

```

Shaving to the appropriate edge. This is simply a matter of reading the stored edge information and storing the appropriate value in `\splinecorrect@p` or `\splinecorrect@c`. The difficult part is to construct the correct control sequence name and then to extract the correct part of the text in its expansion.

The method `\splinealong@#1` finds places along the curve, when `#1` is given as a factor, normally between 0 and 1. The location of the edges of the objects at p and c are stored in `\splinecorrect@p` and `\splinecorrect@c`. These are the places found if the factor is either 0 or 1. If an edge is non-zero then it is actually possible to move to points inside that edge by specifying a factor less than 0 or greater than 1.

```

```

The parameter `#2` in `\splinealong@@#1#2#3` allows for a subsequent slide through a given `<dimen>` along the curve, from the place specified by the factor in `#1`.

The information supplied in `#1` must be converted to the segment number and parameter value of the specified point. These will be calculated and stored temporarily in `\count@` and `\dimen@` before the values are passed respectively to `\splinesegment@` which chooses the segment, and `\spline@find` to locate the point on this segment.

To do the calculation, first we correct for the parameter values of the edges of the objects at the end-points, which are stored in `\splinecorrect@p` and `\splinecorrect@c`. If the resulting number x is not an integer then `\count@` is set to $1 + [x]$ while `\dimen@` becomes $(x - [x])\p@$. If x is an integer: $x = 0$ gives `\count@=1` and `\dimen@=\z@`, otherwise `\count@ = x` and `\dimen@=\p@`.

Breaks Typesetting breaks in curves is quite involved. The `\bstartPLACE@` and `\bendPLACE@` are used to hold parameter values for the positions of the beginning and end of a segment, respectively, when known. The default values of `\relax` indicate that these values need to be found, usually from the start- and end-edges of the curve. The value of `\empty` for `\bstartPLACE@` is used initially with a new curved connection, to set up all its parameters — no typesetting takes place. This is used by curved arrows to set up the connection before places can be found for any breaks.

```

Intersection with a curved connection Just as the intersection of two lines (1.3j) can be found, so can the intersection of a straight line with a curved connection, or the intersection of a curve with a straight connection.

```

\xy**{A}="A";p+/r5pc/+(0,15)**{B}="B"
,p+<1pc,3pc>**{C}="C"
,"A"+<4pc,-1pc>**{D}="D",{\ar@/_/"C"}
,?!{"A";"B"**-}{-}***{\oplus}
\endxy \quad \xy
**{A}="A";p+/r5pc/+(0,15)**{B}="B",
,p+<1pc,3pc>**{C}="C"
,"A"+<4pc,-1pc>**{D}="D", "A";"B"**-}{-}
,?!{"D",{\ar@/_/"C"}}***{\oplus}
\endxy

```

When the line separates the end-points of a curve an intersection can always be found. If there is more than one then that occurring earliest along the curve is the one found.

Presume the end-points of the spline segment are at (X_p, Y_p) and (X_c, Y_c) with (L_p, U_p) and (R_p, D_p) as two points on the line. Then the macro `\xysidesofinterval@` returns 3 pieces of information.

- `\next` expands to 2 characters, each from $\{+, -, 0\}$ indicating which side of, or on, the line lies either end-point;
- `\this@` expands to either $+$ or $-$ indicating which end is closer to the line, returning $+$ if equi-distant;
- `\howclose@` contains a non-negative $\langle \text{num} \rangle$ indicating the distance to the nearest end-point.

```

To Do: If both connections are curves, only the line joining the end-points of the first connection is used. Find a way to do better than this.

If the line does not separate the end-points then there may be no intersection with the curve. If there is one then either the line is tangential or necessarily there will also be at least one other intersection. A message

perhaps no curve intersection, or many.

is written to the log-file, but a search for an intersection will still be performed and a “sensible” place found on the curve. In the usual case of a single quadratic or cubic segment, the place nearest the line is found and the tangent direction is established.

The following examples show this, and show how to get the place on the line nearest to the curve.

```

\xy *+{A}="A";p+/r5pc/+(0,15)*+{B}="B",
,p-<.5pc,2pc>*+{C}="C", "A"+<6pc,-.5pc>
,*+{D}="D", "A", {\ar@/_25pt/"B"}
,?!{"C";"D"*+@{-}*\dir{x}="E"
,+/_2pc="F";"E"*+@{-},?!{"C";"D"}
,*{\otimes}\endxy\quad\xy
*+{A}="A";p+/r5pc/+(0,15)*+{B}="B",
,p-<.5pc,2pc>*+{C}="C"
,"A"+<7pc,.5pc>*+{D}="D", "A"
,{\ar@/_40pt/"B"},?!{"C";"D"*+@{-}
,*{\otimes}\endxy

```

The warning message, that no intersection may exist, always occurs inside a grouping so it can safely switch itself off for deeper levels.

```

1735 \splinedecast@@ }

```

If the line does not cross into the convex hull, then we use the distance from the control points to determine whether or not there can be a closer point. The value of `\prevhowclose@` indicates the best so far, while `\howcvxclose@` temporarily holds the distance to the closest control point. When this is nearer then there will be a closer point on the curve.

```

Miscellaneous features The command `\clearcurve` was originally provided to discard the curve information, and return to the graphics state before the curve was read, if this is ever found to be necessary. This will probably be removed.

```

1842 \xydef@\xyclearcrv@\cv@end\cv@restore\loop@
1843 \expandafter\let\curname cv@\number\crv@cnt@\endcurname\relax
1844 \ifnum\crv@cnt@>0\advance\crv@cnt@\m@ne\repeat@
1845 \let\cv@start=\relax \let\cv@end=\relax \let\cv@restore=\relax \POS}
1846 \xylet@\clearcurve=\xyclearcrv@

```

To Do: Define an `\extendcurve` as a `<postcurve>` which allows the curve to be continued smoothly past the endpoint c .

A macro can be used within the modifier, to provide different labels at each control point. For example...

```

\newcount\cptlabel\global\cptlabel=0
\def\nextcptlabel{\global\advance\cptlabel 1 %
\number\cptlabel}
\xy (0,0)*+{A}; (50,-10)*+{B}
**\crv~Pc{~*{\nextcptlabel}(10,-10)
&(20,15)&(30,-15)&(40,15)} \endxy

```

Two control sequences are provided to access the control points. Firstly `\numcontrolpts` returns the number of them, while `\xycontrolpt⟨num⟩` sets c to be the particular control point. Here $\langle\text{num}\rangle$ must be a single digit, grouped integer *e.g.* `{-15}` or count register containing a numerical value. If larger than `\numcontrolpts` then c becomes the end-point of the curve, while if zero it becomes the starting point. A negative value sets both p and c to be the starting point, whereas other values leave p unchanged.

```

Storing control point locations: Upon starting to read the control points for a curve, first set the counter `\crv@cnt@` to be zero. Store the position of p and c and the current base in control sequences `\cv@start`, `\cv@end` and `\cv@restore` for later retrieval and to reinstate the current graphics state. `\cv@start` is a little more complicated in order to retain the existing value of p .

```

The token list `\crvpts@` stores the following information: current scope, location of p and c , number of control points `\crv@cnt@` and their locations. It does this by storing `\defs` for control sequence names, depending on the scope, which expand to this information. Thus by executing `\the\crvpts@` at the right level, the information is conveniently recovered via control sequences which do not conflict with anything else, and whose names can be reconstructed.

Convex Hull: This macro visits in order each of the control points dropping the requisite object. With the previous as p and the current one as c , a connection is set in the requisite style. For a loop-counter we use `\count@@@`.

Use a group `{\expandafter\POS\xycrvconn@}` else the `\loop@` gets upset. This does not affect the size of the XY -picture, since the dropped objects are not similarly shrouded.

Also used for the trivial case where there are no control points, hence a straight line between p and c is what is requested.

Sometimes TeX will run short of memory when many curves are used without a backend with special support for curves. In that case the following commands, that obey normal TeX groupings, may be helpful:

```

\SloppyCurves
\splinetolerance{<dimen>}

```

allow adjustment of the tolerance used to typeset curves. The first sets tolerance to .8pt, after which `\splinetolerance{0pt}` resets to the original default of fine curves.

Some useful methods for accurate division by integers.

```

2250 \xydef@<dimen>half{%
2251 \advance\dimen@ \ifdim\dimen@<z@-\fi 1sp \divide\dimen@\tw@}

2256 \advance\dimen@ \ifdim\dimen@<z@-\fi .5\dimen@ii
2257 \divide\dimen@ by#1\relax #2=\dimen@}

```

Before constructing the curve we first examine the “drop” object, setting it in an `\xybox`. The size of this object determines the spacing of objects placed along the curve, via the *tolerance* of the spline. This determines the maximum separation of places at which objects will be dropped; *i.e.* when two adjacent places would be separated by more than this amount, the spline algorithm constructs another place on the curve intermediate between these two.

Note: Alter the spline tolerance by adjusting the size of the “drop” object. In particular, a dotted line can be achieved by setting an empty object with non-zero size. If the size is zero then the default tolerance is used. Initially this is .4pt; it may be altered using `\splinetolerance{<dimen>}`, where `<dimen>` must be greater than zero, else the initial tolerance is reset.

```

2278 \xydef@\splinetolerance#1{\dimen@=#1\relax

2291 \xydef@\xylowtolerance@{\splinedefaulttol@
2292 \ifdim\splinetol@<p@ \divide\splinetol@\tw@ \fi}

```

Similarly examine the “connect” object. If none has been specified then there is no need to calculate the tangent direction at each place along the curve. This saves on both time and memory requirement.

Procedure: (1) If `\xycrvdrop@` is empty, define `\splinedrop@` to expand to `\copy\zerodotbox@`, thus creating a curve constructed from small dots. Otherwise (2a) set the `\splinebox@` with the spec-

ified object and (2b) use `\copy\splinebox@` as the expansion of `\splinedrop@`. (3) Set `\splinetol@` to be $\sqrt{2}$ × maximum of width and height+depth of the box.

If `\xycrvconn@` is empty (4) then `\splineconn@` is set to `\relax`. (5) Otherwise it is necessary to reset the direction at each place along the curve before dropping the object specified by `\xycrvconn@`.

```

The macro `\spline@find#1#2` attempts to find a specific point on a single spline segment. `#1` is the parameter value, in the range $[0,1]$ on that segment; `#2` is a $\langle\text{dimen}\rangle$ denoting how much further to slide along the segment. It really only checks whether `#2` has a negative value before passing the information to `\spline@@find#1#2`, which does the actual search.

If `#2` is negative then the spline segment is searched in the reverse direction, starting at its endpoint. This is done by reversing the order of the control points, hence the parameter value found as x implies that we really want $1 - x$ on the un-reversed segment. Similarly the resulting values for $\d@X$ and $\d@Y$ must be negated. The instructions to do this are loaded into a macro `\postfind@` which is expanded once the search has been completed. For an unreversed segment `\postfind@` expands to `{}`.

`\splineTrec@` is the initial value for `\splinerec@` when a spline is being set. It descends the tree of places on the spline (1) until the required parameter value is found (2a) or is sufficiently close (2b). At this point call `\splinesetting@` and `\splinecontinue` to setup, and proceed with, the actual type-setting.

```

3379 \xydef@\splineTrec@{
3380 \advance\splineval@\splinedepth@ % (1)
3381 \ifdim\dimen5=\splineval@ % (2a)
3382 \aftergroup\splinecontinue % (3)

3387 \else
3388 \ifdim\dimen5<\splineval@\aftergroup\splinedecast@ % (1)
3389 \else \aftergroup\splineadvance@ % (1)
3390 \fi\fi\fi}}

```

Setting the curve uses the current `\splinerec@@` and sets `\splinepoint` to `\splineplotpt@` to cause objects to be typeset. This must be done via a `\gdef` rather than a `\global\let` since it is sometimes necessary to omit the object when it would be too close, see `\splinetoclose@`.

The algorithm used for computing coordinates of points on quadratic Bézier splines is essentially that used by D. E. Knuth in the `picmac.tex` macros¹ (aka `gpxmac.tex`). It is a recursive de Casteljau algorithm of the “divide and conquer” type. (In Knuth’s macros these types of curves were given the name “squines”. This explains some of the control sequence names used here.)

The differences from Knuth’s algorithm are simply to allow more of the available information to be used at points along the spline. In particular the tangent direction can be calculated and tests can be performed to decide when to break out of the algorithm, rather than letting it run its full course.

```

The recursive algorithm for cubic Bézier splines is similar to the quadratic one. Now there are two “recursive” control points to be calculated upon each subdivision.

On the p -side:

$$\begin{aligned}
 p_p &= p \\
 l_p &= (p + l)/2 \\
 r_p &= (p + 2l + r)/4 \\
 c_p &= (p + 3l + 3r + c)/8
 \end{aligned}$$

while on the c -side

$$\begin{aligned}
 p_c &= (p + 3l + 3r + c)/8 \\
 l_c &= (l + 2r + c)/4 \\
 r_c &= (r + c)/2 \\
 c_c &= c
 \end{aligned}$$

Notice that $c_p = p_c$ and that the tangents match there.

Start the picture by (1) setting a box, as usual. (2) Initialize global variables; these must be global since they are used to store information which must be preserved outside the grouping which is vital to the recursive nature of the algorithm. (3) Move horizontally to the starting point at p . (4) Begin by handling the starting point; *i.e.* decide whether it is to be plotted or not.

These macros select the correct Bézier control points for each segment of the spline. This is needed for finding places on the constructed curves.

In general there are 5 types of segment: first, second, middle, penultimate, final. The conversion from B-spline to Bézier is slightly different for each type. For middle segments the Bézier control points are determined in the following way:

$$\begin{aligned}
 X_{B_i}^{(1)} &= \frac{1}{3} \left(2X^{(i)} + X^{(i+1)} \right) \\
 X_{B_i}^{(2)} &= \frac{1}{3} \left(X^{(i)} + 2X^{(i+1)} \right) \\
 X_{B_i}^{(0)} &= \frac{1}{6} \left(X^{(i-1)} + 4X^{(i)} + X^{(i+1)} \right) \\
 &= \frac{1}{6} \left(X^{(i-1)} + 7X_{B_i}^{(1)} - 2X_{B_i}^{(2)} \right) \\
 X_{B_i}^{(3)} &= \frac{1}{6} \left(X^{(i)} + 4X^{(i+1)} + X^{(i+2)} \right) \\
 &= \frac{1}{6} \left(X^{(i+2)} + 7X_{B_i}^{(2)} - 2X_{B_i}^{(1)} \right)
 \end{aligned}$$

2.1.2 Circles and Ellipses

Here we describe the means to specify circles of arbitrary radius, drawn with arbitrary line styles. When large-sized objects are used they are regularly spaced around the circle. Similarly ellipses may be specified, but only those having major/minor axes aligned in the standard directions; spacing of objects is no longer regular, but is bunched toward the narrower ends.

Such a circle or ellipse is specified using...

`\xycircle<vector>{<style>}`

where the components of the `<vector>` determine the lengths of the axis for the ellipse; thus giving a circle when equal. The `<style>` can be any `<conn>`, as in 3.2 that works with curved arrows—many do. Alternatively `<style>` can be any `<object>`, which will be placed equally-spaced about the circle at a separation to snugly fit the `<object>`s. If `<empty>` then a solid circle or ellipse is drawn.

To Do: Recognize special `<style>`s; e.g. `.` for dotted with `\zerodot`, `=` for a doubled circle — alter the radius, draw two circles; `:` for double dotted (perhaps use `\doubled@`, `\tripled@`); `>` and `<` for chevrons; any others?

To use any of these special symbols as the `<object>` for `<style>` then enclose it within extra braces, e.g. `\xycircle<20pt>{>}`.

The curves are not truly circular or elliptical, but are approximations given by cubic Bézier segments. Hence the `xycurve` feature must be loaded.

```
4432 \message{circles,}
```

The circles are constructed from four Bézier cubic curves, one for each quadrant of the circle or circle. To do this it is sufficient to establish the control points for each cubic segment. This is straightforward, using the following “magic number”, given a square basis such that the desired circle is the unit circle, or rectangular basis for which the “unit circle” is the desired circle.

```

4443 \xydef@\Circmagic@@{0.5517847}
4444 \xylet@\Circmagic=\Circmagic@@
4445 \xydef@\twoPi@{6.2831852}
4446 \xydef@\fullPi@{3.1415926}
4447 \xydef@\halfPi@{1.5707963}

```

This is the magic number, exactly given by $\frac{1}{12}(\sqrt{385} - 13)$, that helps construct the Bézier cubic curve that best approximates a quadrant of a circle. It does so with remarkable accuracy, differing by at most .5% of the radius at any angle; the average deviation along the whole quadrant being less than .13%. The basic `<object>` defined here is `\circle`.

This places objects equally spaced around a circle, according to angular position.

Bug: objects are not equally spaced around ellipses constructed this way. To get regular spacing around ellipses, in terms of arc-length say, is much more difficult, both theoretically and practically.

To Do: the size of the resulting `<object>` does not take into account the size of the `<object>` dropped around the circle.

2.1.3 Quadratic Splines

Quadratic Bézier splines, as distinct from cubic Bézier splines, are constructed from parabolic arcs, using ‘control points’ to determine the tangents where successive arcs are joined.

Various implementations of such curves exist. The one adopted here is consistent with the `xfig` drawing utility and TPIC implementations. These have the property of beginning and ending with straight segments, half the length to the corresponding adjacent control-point. Furthermore the mid-point between successive control-points lies on the spline, with the line joining the control-points being tangent there.

Such curves are specified, either as a `<decor>` or as an `<object>`, using...

`\qspline{<style>}`

where the start and end of the curve are at p and c respectively. The control-points are taken from the current stack, see 1.3o. If this stack is empty then a straight line is constructed.

The following example compares the quadratic spline with the gentler curving B-spline having the same control points, using `\crvs`.

```
\xy /r1.5pc/: ,+<5pc,3pc>+{P};p
@(+,(2,2)*{+}@+, +(2,-2)*{+}@+
,+(2,2)*{+}@+, +(2,0)*{C}="C"
,*\qspline{,"C",**\crvs{.}
,@i @)\endxy
```

If the current stack is empty, simply pass everything to `\crvs@`, as if the request originated from a `\crvs` or `\ar`. Otherwise we must build up the segments of the spline.

```
4772 \xydef@\qspline{\hbox\bgroup\crvresetbreaks@ \xy@spline@}
4774 \xydef@\xy@spline@#1#\if\sempty@ \DN@{\crvs@{\}\resetbreaks@}%
4775 \else\DN@{\xy@spline@i{#1}}\fi \next@ }%
```

The `#1` parameter to `\xy@spline@i` is to allow alternative implementations; currently it is ignored. When `#1` is indeed empty,

2.2 Frame and Bracket extension

Vers. 3.12 by Kristoffer H. Rose <krisrose@tug.org>

The frame extension provides a variety of ways to puts frames in Xy-pictures.

26 {Kristoffer H.~Rose}{krisrose@tug.org}%
27 {IBM T.~J.~Watson Research Center, P.O.~Box 704, Yorktown Heights, NY 10598 (USA)}
```

The frames are Xy-pic <object>s on the form

$$\backslash\text{frm}\{ \langle\text{frame}\rangle \}$$

to be used in <pos>itions: Dropping a frame with `*... \frm{<frame>}` will frame the *c* object; connecting with `**... \frm{... <frame>}` will frame the result of *c.p*.

Xy-pic interface The frames are integrated in Xy-pic as <object>s as follows. They generate a dummy object, then define the `\Drop@@` action to place the requested frame. The `\Connect@@` operation is defined to place the requested frame around the current *and* the previous object (using the `\cmerge@` command of the kernel).

```

61 \xydef@\frm{\hbox{}}\dimen@=\L@c \advance\dimen@\R@c \wdz@=\dimen@
62 \ht\z@=\U@c \dp\z@=\D@c \dimen@=\U@c \advance\dimen@\D@c
63 % \ifdim\wdz@=\z@ \def\Leftness@{0}\else \quotient@\Leftness@\L@c\wdz@ \fi
64 % \ifdim\dimen@=\z@ \def\Upness@{0}\else \quotient@\Upness@\U@c\dimen@ \fi
65 \ifdim\wdz@=\z@ \def\Leftness@{.5}\else \quotient@\Leftness@\L@c\wdz@ \fi
66 \ifdim\dimen@=\z@ \def\Upness@{.5}\else \quotient@\Upness@\U@c\dimen@ \fi
67 \expandafter\Edge@c\expandafter{\prevEdge@@}\let\frmradius@@=\z@
68 \def\Drop@@{ }%
69 \def\Connect@@{\xy@@{\save@cmerge@Y@p\X@p\D@p\U@p\L@p\R@p\Drop@@}\restore}%
70 \xyFN@\frm@i}
72 \xylet@\frmradius@@=\z@
74 \xydef@\frm@i{%
75 \addLT@\ifx\next \addGT@{\addLT@\DN@##1}{\def\frmradius@@{##1}\xyFN@\frm@i}%
76 \else \DN@##1##{\frm@{##1}}\fi \next@}

```

The main command is `\frm@` which looks up if a custom control sequence is available for the requested frame or whether the generic ‘curve along the edge’ code should be invoked.

```

84 \xydef@\frm@#1#2{\DNii@\frm@#1{#2}}%
85 \expandafter\let\expandafter\next@\curname\codeof\nextii@\endcsname
86 \ifx\next@\relax \DNii@\frm@{#2}}%
87 \expandafter\let\expandafter\next@\curname\codeof\nextii@\endcsname
88 \ifx\next@\relax \let\next@=\frm@generic \fi\fi \next@}
90 \xydef@\frm@generic{\xyerror@{No generic frames yet!}}{ }

```

This extra command is used to define `\Drop@@` for each frame such that `\frmradius@@` is available.

```

97 \xydef@\frmDrop@#1{%
98 \ifx\frmradius@@\z@ \addtoDrop@@{\let\frmradius@@=\z@ #1}%
99 \else \expandafter\addtoDrop@@\expandafter{%
100 \expandafter\def\expandafter\frmradius@@\expandafter{\frmradius@@#1}\fi}
102 \xydef@\EdgefromtheEdge@{%
103 \U@c=\the\U@c \D@c=\the\D@c \L@c=\the\L@c \R@c=\the\R@c
104 \Edge@c={\expandafter\noexpand\the\Edge@c}}
105 \xydef@\prevEdgefromtheEdge@{%
106 \U@c=\the\U@c \D@c=\the\D@c \L@c=\the\L@c \R@c=\the\R@c
107 \noexpand\def\noexpand\prevEdge@@{\expandafter\noexpand\the\Edge@c}}
109 \xydef@\addtoDrop@@#1{%

111 \xydef@\addbeforeDrop@@#1{\DNii@{#1}}%
112 \expandafter\DN@\expandafter{\expandafter\nextii@\Drop@@}%
113 \expandafter\expandafter\expandafter\def
114 \expandafter\expandafter\expandafter\Drop@@
115 \expandafter\expandafter\expandafter{\next@}

```

Below we distinguish between ‘ordinary’ frames, ‘brackets’ and ‘fills’; last we present how some frames can be added to other objects using object modifier `(shape)`s.

2.2.1 Frames

Figure 2.2 shows the possible frames and the applicable `(modifier)`s with reference to the notes below.

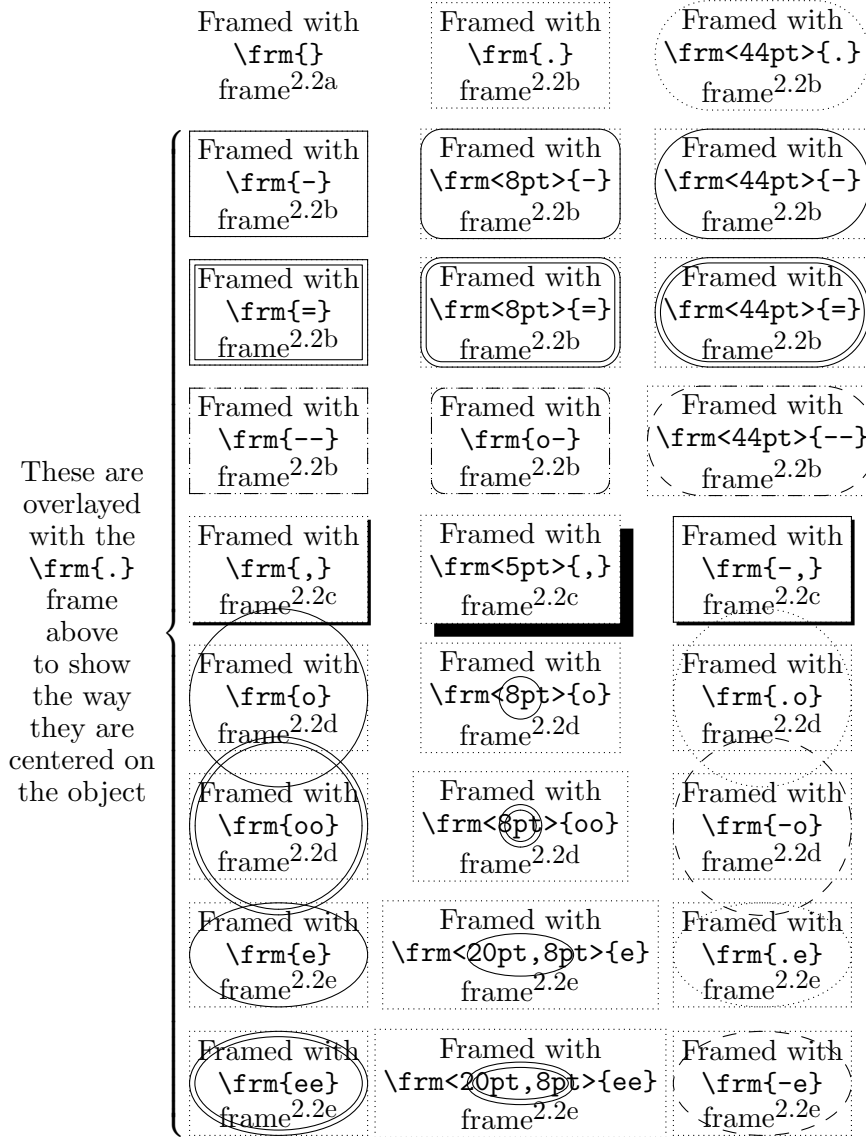

Figure 2.2: Plain `<frame>`s.

Figure 2.3: Bracket `<frame>`s.

Notes

2.2a. The `\frm{}` frame is a dummy useful for not putting a frame on something, *e.g.*, in macros that take a `(frame)` argument.

```
204 \xydefcsname@{frm{}}{ }
205 \xyletcsnamecsname@{frm[]}{ }{frm{}}
206 \xyletcsnamecsname@{frm[o]}{ }{frm{}}
```

2.2b. *Rectangular* frames include `\frm{.}`, `\frm{-}`, `\frm{=}`, `\frm{--}`, `\frm{==}`, and `\frm{o-}`. They all make rectangular frames that essentially trace the border of a rectangle-shaped object.

The `(frame)s` `\frm{-}` and `\frm{=}` allow an optional *corner radius* that rounds the corners of the frame with quarter circles of the specified radius. This is not allowed for the other frames—the `\frm{o-}` frame always gives rounded corners of the same size as the used dashes (when `\xydashfont` is the default one then these are 5pt in radius).

Exercise 2.4: How do you think the author typeset the following?

(p.580)

The commands still hack away with rules and stuff...

`\frm{.}` just fills the edges of the object rectangle border with dots using dots as in dotted connections in the kernel.

```
250 \xydefcsname@{frm{.}}{\frmDrop@{\let\zerocorner=\framezerodot@
251 \let\framehfill=\frm@doth@@ \let\framevfill=\frm@dotv@@
252 \framed@@{\frmradius@@}}
254 \xyletcsnamecsname@{frm[]}{.}{frm{.}}
256 \xydef@{\frm@doth@@{\setboxz@h{\kern5\B@\framezerodot@@\kern5\B@}\ht\z@=\B@
257 \dp\z@=\B@\kern5\B@\xleaders\boxz@\hss\kern5\B@}
258 \xydef@{\frm@dotv@@{\setboxz@h to2\B@{\hss\framezerodot@@\hss}\ht\z@=5\B@
259 \dp\z@=5\B@\kern5\B@\xleaders\boxz@\vss\kern5\B@}
261 \xyletcsnamecsname@{frm{.}}{frm{.}}
263 \xylet@\framezerodot@@=\zerodot
```

The `\frm<variant>{-}` and `\frm<variant>{=}` set a single/double frame that just surrounds the current object; if a `(radius)` is given then it should be a `<(dimen)>` where the `(dimen)` will be used for the corner radius.

The commands for `\frm{-}` and `\frm{=}` are quite similar in that they just call `\framed@` one or two times, respectively, with the corner radius and *L, R, D, U* extents reflecting the size of the frame. `\framed@` then sets the horizontal and vertical fill commands to generate rules of the right length, then calls `\framed@@` where the real work is done.

```
279 \xydefcsname@{frm{-}}{\frmDrop@{\framed@\frmradius@@}}
280 \xyletcsnamecsname@{frm[]}{-}{frm{-}}
282 \xydef@\framed@{\let\zerocorner=\framezerodot@@
283 \let\framehfill=\frm@solidh@@ \let\framevfill=\frm@solidv@@ \framed@@}
```

```

285 \xylet@\framesetthick@=\relax
287 \xydef@\frm@solidh@@{\framesetthick@leaders\hrule height\B@ depth\B@\hfill}
288 \xydef@\frm@solidv@@{\framesetthick@leaders\vrule width2\B@\vfill}
290 \xydefcsname@{frm{=}}{\frmDrop@{\framed@\frmradius@@
291   {\advance\L@c-2\p@ \advance\R@c-2\p@ \advance\U@c-2\p@ \advance\D@c-2\p@
292   \dimen@=\frmradius@@
293   \ifdim\dimen@>2\p@ \advance\dimen@-2\p@ \else \dimen@=\z@\fi
294   \framed@\dimen@}}
296 \xyletcsnamecsname@{frm[] {=}}{frm{=}}

```

When the line extension is also loaded then we use the line thickness for frames:

```

303 \xydef@\framesetthick@line{\B@=.5\xylinethick@}
305 \xydef@\frm@thickc@@{\hbox{\framesetthick@line
306   \vrule height.5\B@ depth.5\B@ width\B@}}
308 \xywithoption{line}{%
309   \let\framezerodot@\frm@thickc@@ \let\framesetthick@=\framesetthick@line}

```

`\framed@@` is where we build a box with the sides of the frame displaced appropriately. **To DoGeneralise this to handle any directional!**

```

317 % Procedure:
318 % %0 setup hrulefill and vrulefill as appropriate...
319 % %1 Lower R to be less than half of both (U+D) and (L+R).
320 % %2 Start vbox at (X-L,Y-D) except center overshoot.

2.2c. The frame `\frm{,}` puts a shade, built from rules, into the picture beneath the (assumed rectangular) object, thereby giving the illusion of ‘lifting’ it; `\frm<dimen>{,}` makes this shade `<dimen>` deep.

`\frm{-,}` combines a `\frm{-}` with a `\frm{,}`.

A black rule is just that, a shade is two rules placed under and left of the rectangular object outline.

```

To Do: Allow \langle frame variant \rangle s like those used for directionals, *i.e.*, $\backslash\text{frm2}\{-\}$ should be the same as $\backslash\text{frm}\{=\}$. Add $\backslash\text{frm}\{o, \}$ and more brackets.

2.2.2 Brackets

The possible brackets are shown in figure 2.3 with notes below.

Notes

2.2f. *Braces* are just the standard plain T_EX large braces inserted correctly in X_Y-pic pictures with the ‘nib’ aligned with the reference point of the object they brace.

Exercise 2.6: How do you think the author typeset the following?

(p.580)

They just use the pieces of plain T_EX brace delimiters at $\backslash\text{Bigg}$ size and those of $\backslash\text{overbrace}$ and $\backslash\text{underbrace}$.

```

712 \xydefcsname@{\frm{\}}{\addtoDrop@@{\lbraced}}
713 \xydefcsname@{\frm{\}}{\addtoDrop@@{\rbraced}}
715 \xydefcsname@{\frm{^}}{\addtoDrop@@{\ubraced}}
716 \xydefcsname@{\frm{_\}}{\addtoDrop@@{\dbraced}}

```

The horizontal ones mimick the plain T_EX ones quite closely:

```

722 \xydef@\dbraced{\xy@@{\setboxz@h{%
723   \A@=\X@c \advance\A@-\L@c \B@=\Y@c \advance\B@-\D@c
724   \setboxz@h{\$m@th\bracelu$}\dimen@=2\wdz@ \advance\B@-.5\ht\z@
725   \ifdim\R@c<\dimen@ \R@c=\dimen@ \fi
726   \ifdim\L@c<\dimen@ \advance\A@-\dimen@ \advance\A@\L@c \L@c=\dimen@ \fi
727   \advance\A@-.25pt %
728   \kern\A@\raise\B@\hbox{%
729     \hbox to\L@c{\$m@th\bracelu\leaders\vrule\hfil\bracerd$}}%
730   \kern.5pt %
731   \hbox to\R@c{\$m@th\braceld\leaders\vrule\hfil\braceru$}}}%
732 \ht\z@=\z@ \dp\z@=\z@ \wd\z@=\z@ \boxz@}}

734 \xydef@\ubraced{\xy@@{\setboxz@h{%
735   \A@=\X@c \advance\A@-\L@c \B@=\Y@c \advance\B@\U@c
736   \setboxz@h{\$m@th\bracelu$}\dimen@=2\wdz@
737   \ifdim\R@c<\dimen@ \R@c=\dimen@ \fi
738   \ifdim\L@c<\dimen@ \advance\A@-\dimen@ \advance\A@\L@c \L@c=\dimen@ \fi
739   \advance\A@-.25pt %
740   \kern\A@\raise\B@\hbox{%
741     \hbox to\L@c{\$m@th\braceld\leaders\vrule\hfil\braceru$}}%
742   \kern.5pt %

Bug: The brackets above require that the computer modern `cmex` font is loaded in T_EX font position 3.

2.2.3 Filled regions

In addition to the above there is a special frame that “fills” the inside of the current object with ink: `\frm{*}` and `\frm{**}`; the latter is intended for *emphasizing* and thus “strokes” the outline, using the thinnest black line available on the printer or output device; furthermore it moits the actual filling in case this would obscure further text typeset on top. Some alteration to the shape is possible, using `*\frm<dimen>{*}`. Hence rectangular, oval, circular and elliptical shapes can be specified for filling. The following examples illustrate this in each case:

<code><object></code>	<code>\frm{*}</code>	<code>\frm{**}</code>	<code>\frm<6pt>{*}</code>
			
			

However, filling non-rectangular shapes will result in a rectangle unless a driver is used that supports arbitrary filling. With some drivers the above fills will thus all be identical, as rectangular.

When the previous `<object>` has `\rectangleEdge` then the shape is either oval or rectangular, depending on whether a `<dimen>` has been specified, using the `<dimen>` as radius for the corners, but not exceeding half the shorter side-length.

When the current `<object>` has `\circleEdge` then the region is elliptical, using the extents `R+L` and `U+D` as the major/minor axes, or circular if a `<dimen>` is specified. The `<dimen>` will become the radius after reducing to a maximum of half the longest side of the enclosing rectangle. With `\zeroEdge` presume rectangular, or circular if a `<dimen>` is supplied.

The default for `\frm{**}` is to just make a plain frame.

```

```

2.2.4 Framing as object modifier

In addition, frames may be accessed using the special `[F[frame]]` object modifier `<shape>`s that will add the desired `<frame>` to the current object. The frame appropriate to the edge of the object will be chosen (presently either rectangular or elliptical).

If shape modifiers need to be applied to the `<frame>` alone then they can be included using `:` as separator. Thus `[F-:red]` will make a red frame (provided the color extension is active, of course). Additionally the variant of frames using `<(dimen)>` can be accessed by specifying `[...:<(dimen)>]`.

```

1011 \xydefcsname@{shape [F...]}#1{\xyFN@Fshape@#1:@}

1040 \expandafter\expandafter\expandafter{%
1041 \expandafter\whichframe@@\expandafter}\expandafter{\whichoptions@@}}

```

The following are used to ensure that the current styles, after typesetting, are those of the \langle object \rangle , rather than the \langle frame \rangle .

```

1050 \xydef@\saveframestyles@{%
1051 \expandafter\def\expandafter\afterframe@preStyle@\expandafter{\preXY@style@}%
1052 \expandafter\def\expandafter\afterframe@postStyle@\expandafter{\postXY@style@}}
1054 \xydef@\restoreframestyles@{%
1055 \expandafter\gdef\expandafter\preXY@style@\expandafter{\afterframe@preStyle@}%
1056 \expandafter\gdef\expandafter\postXY@style@\expandafter{\afterframe@postStyle@}%
1057 \def\afterframe@preStyle@{\}\def\afterframe@postStyle@{\}}

```

Here are some simple examples using this feature.

```

\xy **<1.5pt>[F**:white]++[F**:red]
\txt{text with background}
, +!D+/d1pc/, ***[F**:black] [white]
\txt\bf{bold white on black}\endxy

```

Notice that when multiple frame-modifiers are used, the frames are actually placed in reverse order, so that earlier ones are printed on top of later ones.

To Do: The frame option is not quite complete yet: some new frames and several new brackets should be added.

2.2.5 Using curves for frames

If the curve option is loaded, then circular and elliptical frames of arbitrary radius can be constructed, by specifying `\UseCurvedFrames`. This can be negated by `\UseFontFrames`. Both of these commands obey normal \TeX grouping. Furthermore, dotted and dashed frames now have a regular spacing of their constituent objects. The usual warnings about memory requirements for large numbers of curves apply here also.

Use the `\xycircle` setup in `xycurve.doc` to implement circular and elliptical frames.

```

1097 \xydef@\xycircleframe@x@{\L@=\R@ \xycircleframe@x@i}%
1098 \xydef@\xyellipseframe@x@#1#2{\R@=#1\relax \L@=#2\relax \xycircleframe@x@i}
1100 \xydef@\xycircleframe@x@i{%
1101 \ifx\framehfill\frm@solidh@@\def\circleSTYLE@{}}%
1102 \else\ifx\framehfill\frm@doth@@
1103 \expandafter\def\expandafter\circleSTYLE@\expandafter{\addDOT@{}}%

2.3 More Tips extension

Vers. 3.8 by Kristoffer H. Rose <kris@diku.dk>

This extension provides several additional styles of ‘tips’ for use (primarily) as arrow heads, and makes it possible to define customised tips. This is used to support tips that mimic the style of the Computer Modern fonts² by Knuth (see [8] and [6, appendix F]) and of the Euler math fonts distributed by the *AMS*.

2.4 Line styles extension

Vers. 3.9 by Ross Moore (ross.moore@mq.edu.au)

This extension provides the ability to request various effects related to the appearance of straight lines; *e.g.* thickness, non-standard dashing, and colour.

Header:

```

These are effects which are not normally available within T_EX. Instead they require a suitable ‘back-end’ option to provide the necessary `\special` commands, or extra fonts, together with appropriate commands to implement the effects. Thus

Using this extension will have no effect on the output unless used with a backend that explicitly supports it.

The extension provides special effects that can be used with any X_Y-pic (object), by defining [`<shape>`] modifiers. The modification is local to the (object) currently being built, so will have no effect if this object is never actually used.

Adjusting line thickness The following table lists the modifiers primarily to alter the thickness of lines used by X_Y-pic. They come in two types — either a single keyword, or using the key-character | with the following text parsed.

[thicker]	double line thickness
[thinner]	halve line thickness
[(<num>)]	multiple of usual thickness
[<dimen>]	set thickness to <code><dimen></code>
[<dimen>]	also sets to <code><dimen></code>
[= <word>]	make [<code><word></code>] set current style settings
[*]	reuse previous style
[butt]	butt cap at ends

[roundcap]	round cap at ends
[projcap]	projecting square cap.

Later settings of the linewidth override earlier settings; multiple calls to [thicker] and [thinner] compound, but the other variants set an absolute thickness. The line-thickness specification affects arrow-tips as well as the thickness of straight lines and curves. Three kinds of line-caps are available; they are discussed below in the section on ‘poly-lines’.

```
\xy/r8pc/:*++\txt\huge{C}="c"
,0*++\txt\huge{P}="p",
,"p",{\ar@*{[| (1)]}"p";"c"<20pt>}
,"p",{\ar@*{[| (4)]}"p";"c"<14pt>}
,"p",{\ar@*{[| (10)]}"p";"c"<4pt>}
,"p",{\ar@*{[| (20)]}"p";"c"<-16pt>}
\endxy
```

Using the POSTSCRIPT back-end, the size of the arrow-head grows aesthetically with the thickness of the line used to draw it. This growth varies as the square-root of the thickness; thus for very thick lines (20+ times normal) the arrowhead begins to merge with the stem.

Load the style extension to establish the necessary infra-structure.

```
112 %\xydefcsname@{shape [| . . .]}#1{\xyFN@xywidthchar@#1@@}%
113 \xydefcsname@{*stylechar@|@}#1{\xyFN@xywidthchar@#1@@}%
115 %\xydefcsname@{shape [thinner]}{\xyshape@thinner@{}}
116 %\xydefcsname@{shape [thicker]}{\xyshape@thicker@{}}
117 \xydefcsname@{style [thinner]}{\xyshape@thinner@}
118 \xydefcsname@{style [thicker]}{\xyshape@thicker@}
```

Implementation Record the line thickness locally in a dimen register. The initial value is read from the xydash10 font. Each time \xylinethick@ is changed, its previous value is stored as the expansion of \xyprevwidth@, in case this is needed by a specific back-end.

```

```

The diagram in figure 2.4, page 234, uses different line-thicknesses and colours.

Poly-lines By a ‘poly-line’ we mean a path built from straight line segments having no gaps where each segment abuts the next. The poly-line could be the edges of a polygon, either closed or open if the end-points are different.

The reason for considering a poly-line as a separate ⟨object⟩, rather than simply as a ⟨path⟩ built from straight lines, becomes apparent only when the lines have appreciable thickness. Then there are several standard ways to fashion the ‘joins’ (where segments meet). Also the shape of the ‘caps’ at either end of the poly-line can be altered.

The following modifiers are used to determine the shapes of the line ‘caps’ and ‘joins’:

[J⟨val⟩]	join style, ⟨val⟩ = 0, 1 or 2
[mitre]	mitre-join, same as [J0]
[roundjoin]	round join, same as [J1]
[bevel]	bevel-join, same as [J2]
[C⟨val⟩]	end-cap, ⟨val⟩ = 0, 1 or 2
[butt]	“butt” cap, same as [C0]
[roundcap]	round cap, same as [C1]
[projcap]	“projecting square” cap, same as [C2]
[M(⟨num⟩)]	set mitrelimit to ⟨num⟩ ≥ 1

These effects are currently implemented only with the POSTSCRIPT back-end or when using `\xypolyline` (described below) with a POSTSCRIPT ⟨driver⟩. In this case the ‘cap’ setting can be applied to any segment, straight or curved, whether part of a poly-line or not; however the ‘join’ setting applies only to poly-lines. Arrow-tips are not affected. The defaults are to use round joins and round-cap ends.

Adjusting the miter-limit affects how far miters are allowed to protrude when two wide lines meet at small angles. The ⟨num⟩ is in units of the line-thickness. Higher values mean using bevels only at smaller angles, while the value of 1 is equivalent to using bevels at all angles. The default miter-limit is 10.

Current values are stored in case these are needed within nested portions of diagrams.

```

220 \xydef\xylinecap@{2}
221 \xydef\xylinejoin@{2}
222 \xydef\xylinemiter@{10}

```

Recognise keywords for ‘line-caps’ and ‘line-joins’:

```

250 \xydefcsname@{style [bevel]}{\xyshape@bevel@}
251 \xydefcsname@{style [roundjoin]}{\xyshape@rdjoin@}
252 \xydefcsname@{style [miter]}{\xyshape@miter@}
253 %
254 \xydefcsname@{style [butt]}{\xyshape@butt@}
255 \xydefcsname@{style [roundcap]}{\xyshape@rdcap@}
256 \xydefcsname@{style [projcap]}{\xyshape@projcap@}

260 \xydef@{xyshape@butt@}{\xysetlinecap@@0}
261 \xydef@{xyshape@rdcap@}{\xysetlinecap@@1}
262 \xydef@{xyshape@projcap@}{\xysetlinecap@@2}

```

The path taken by the ‘poly-line’ this is read as the list of (pos)itions in the current ‘stack’, ignoring

size extents. The macro `\xypolyline` is used as a $\langle\text{decor}\rangle$; it reads the $\langle\text{pos}\rangle$ itions from the stack, but leaves the stack intact for later use.

Implementation of ‘poly-lines’.

```

388 \xydef@\xypolyline#1{\xypolyline@{#1}}
390 \xydef@\xypolyline@#1{\hbox\bgroup
391 \enter@{\pfromthep@ \basefromthebase@ \cfromthec@}%

396 \leave@ \xy@polystyle@{#1}\xydopoly@style\egroup
397 \def\Drop@{\styledboxz@}\def\Connect@{\styledboxz@}%

```

The following diagram illustrates the use of line-thickness, line-joins and line-caps with poly-lines. It contains an example of each of the styles.

```

\xycompileto{poly}%
{/r4pc/:,*[|<5pt>][thicker]\xybox{%
  *(3,2){}="X"
;@={p+CU,p+LU,p+LD,p+RD,p+RU,p+CU}
,{0*[miter]\xypolyline{}}
,{\xypolyline{*}},@i@)
,"X",*(2.5,1.5){}="X"
,@={!CU,!LU,!LD,!RD,!RU,!CU}
,{0*[gray][roundjoin]\xypolyline{}}
,{0*[gray]\xypolyline{*}},@i@)
,"X",*(2,1){}="X"
,@={!CU,!LU,!LD,!RD,!RU,!CU}
,{0*[white]\xypolyline{*}}
,{0*[bevel]\xypolyline{}},@i@)
,"X"-(.7,0)*+\txt\LARGE{A}="a"
,"X"+(.7,0)*+\txt\LARGE{B}="b"
,{\ar@{-}@*{[butt][thinner]}"a";"b"<1pc>}
,{\ar@{-}@*{[roundcap][thinner]}"a";"b"}
,{\ar@{-}@*{[projcap][thinner]}"a";"b"<-1pc>}
}}

```

Note the use of `{0*[...]\xypolyline{..}}` to apply style-modifiers to a polyline. The `@={!..}` method for loading the stack gives equivalent results to using `;@={p+..}`, since `\xypolyline` ignores the edge extents of each $\langle\text{pos}\rangle$ in the stack.

Note also that the argument #1 to `\xypolyline` affects what is typeset. Allowable arguments are:

`\xypolyline{}` solid line

```

\xypolyline{.}   dotted line
\xypolyline{-}  dashed line
\xypolyline{*}  fill enclosed polygon
\xypolyline{?}  fill enclosed polygon using even-odd rule
\xypolyline{[*]} use \dir[*] for lines
\xypolyline{<toks>} using \dir{<toks>}

```

The latter cases one has `**\dir{...}` being used to connect the vertices of the polyline, with `{[*]}` being needed to get `**\dir[*]`. Similarly `**\dir` is used when a `<driver>` is not available to specifically support polylines; in particular the two ‘fill’ options `*` and `?` will result in a dotted polygon outline the region intended to be filled.

In all cases it is up to the user to load the stack before calling `\xypolyline{...}`. A particularly common case is the outline of an existing `Xy-pic` `<object>`, as in the example above. Future extensions to `\frm` will provide a simplified mechanism whereby the user need not call `\xypolyline` explicitly for such effects.

2.5 Rotate and Scale extension

Vers. 3.7 by Ross Moore <ross.moore@mq.edu.au>

This extension provides the ability to request that any object be displayed rotated at any angle as well as scaled in various ways.

Header:

```

These are effects which are not normally available within TeX. Instead they require a suitable ‘back-end’ option to provide the necessary `\special` commands, or extra fonts, together with appropriate commands to implement the effects. Thus

Using this extension will have no effect on the output unless used with a backend that explicitly supports it.

```

52 \xydef\xyundefinedRotate@#1#2@{\% \egroup %
53 \xywarning@{The #1 #2 effect is not implemented with the current driver.}}%

```

The extension provides special effects that can be used with any Xy-pic `<object>` by defining [`<shape>`] modifiers. The modification is local to the `<object>` currently being built, so will have no effect if this object is never actually used.

The following table lists the modifiers that have so far been defined. They come in two types – either a single keyword, or a key-character with the following text treated as a single argument.

<code>[@]</code>	align with current direction
<code>[@<direction>]</code>	align to <code><direction></code>
<code>[@!<number>]</code>	rotate <code><number></code> degrees
<code>[*<number>]</code>	scale by <code><number></code>
<code>[*<num>_x,<num>_y]</code>	scale <code>x</code> and <code>y</code> separately
<code>[left]</code>	rotate anticlockwise by 90°
<code>[right]</code>	rotate (clockwise) by 90°
<code>[flip]</code>	rotate by 180°; same as <code>[*-1,-1]</code>
<code>[dblsize]</code>	scale to double size
<code>[halfsize]</code>	scale to half size

These [`<shape>`] modifiers specify transformations of the `<object>` currently being built. If the object has a rectangle edge then the size of the rectangle is transformed to enclose the transformed object; with a circle edge the radius is altered appropriately.

To Do: There should be an `[@*]` form which repeats the set of transformations applied to the last object which has been transformed, possibly in an earlier diagram. Also an `[@=<word>]` form allowing a set of transformations to be saved and used later, simply by specifying [`<word>`].

Each successive transformation acts upon the result of all previous. One consequence of this is that the order of the shape modifiers can make a significant difference in appearance—in general, transformations do not commute. Even successive rotations can give different sized rectangles if taken in the reverse order.

Sometimes this change of size is not desirable. The following commands are provided to modify this behaviour.

<code>\NoResizing</code>	prevents size adjustment
<code>\UseResizing</code>	restores size adjustments

```

119 \xydef@\NoResizing{\xyNoResizing@}
120 \xydef@\UseResizing{\xyUseResizing@}
122 \xydef@\xyNoResizing@{%
123 \global\let\origxyrescale@=\xyrescale@
124 \global\let\origxyrotSizeMod@=\xyrotateSizeMod@
125 \global\let\xyNoResizing@=\xyNoResizing@@
126 \global\let\xyUseResizing@=\xyUseResizing@@
127 \xyNoResizing@@ }
129 \xydef@\xyNoResizing@@{%
130 \global\let\xyrescale@=\xyignoreyscale@
131 \global\let\xyrotateSizeMod@=\xyignoreSizeMod@
132 }
134 \xylet@\xyUseResizing@=\relax
135 \xydef@\xyUseResizing@@{%
136 \global\let\xyrescale@=\origxyrescale@
137 \global\let\xyrotateSizeMod@=\origxyrotSizeMod@
138 }

```

The `\NoResizing` command is also useful to have at the beginning of a document being typeset using a driver that cannot support scaling effects, in particular when applied to whole diagrams. In any case an unscaled version will result, but now the spacing and positioning will be appropriate to the unscaled rather than the scaled size.

Interface Recognize the `(shape)` characters and keywords.

```

157 \xydefcsname@{shape [ @ . . . ]}#1{\xyrotatechar@{#1}@@}%
158 \xydefcsname@{shape [ < . . . ]}#1{\xyshearchar@{#1}@@}%
159 \xydefcsname@{shape [ * . . . ]}#1{\xyscalechar@{#1}@@}%
161 \xydefcsname@{shape [ left ]}{\xyshape@left@}
162 \xydefcsname@{shape [ right ]}{\xyshape@right@}
163 \xydefcsname@{shape [ flip ]}{\xyshape@flip@}
164 \xydefcsname@{shape [ halfsize ]}{\xyshape@halfsize@}
165 \xydefcsname@{shape [ dblsize ]}{\xyshape@dblsize@}
166 \xydefcsname@{shape [ vflip ]}{\xyshape@vflip@}
167 \xydefcsname@{shape [ hflip ]}{\xyshape@hflip@}

```

Each style modifier adds code to one, or both, of two global lists. These contents of these lists, called `\preXYtransform@@` and `\postXYtransform@@`. An implementation must define macros which are to be bound to the control sequence names `\preXYtransform@` and `\postXYtransform@`, which are prepended and appended to the `\Drop@@` and `Connect@@` methods for the current (object).

Also `\Drop@@` and `\Connect@@` must be modified, if this has not already been done as indicated by `\xy@transform@` having expansion `\relax`.

```

184 \xydef@\preXYtransform@{}

```

```

185 \xydef@\postXYtransform@{}
187 \xywarnifdefined\preXYtransform@@
188 \xywarnifdefined\postXYtransform@@
189 \gdef\preXYtransform@{}
190 \gdef\postXYtransform@{}
191 \xydef@\xy@transform@{}
192 \xydef@\preShape@@{}
193 \xydef@\postShape@@{}

```

The transformations must be implemented by emulating the adjoint coordinate transformations. This requires that code be added to `preXYtransform@@` in reverse order to the order of occurrence of the `<shape>` modifiers. The code is added to `\postXYtransform@@` in natural order, so that each addition to `\preXYtransform@@` can be closed off, if necessary, in a correctly nested sequence.

```

204 \xydef@\modXYtransform@{%
205   \ifx\xy@transform@\empty
206     \transformDrop@\transformConnect@\resetTransform@\fi
207   %\show\preShape@@
208   \DN@##1{\expandafter\def\expandafter\tmp@\expandafter{##1}}%
209   \expandafter\next@\expandafter{\preShape@@}%
210   \DN@##1{\expandafter\gdef\expandafter\preXYtransform@@\expandafter{%
211     \tmp@ ##1}}\expandafter\next@\expandafter{\preXYtransform@@}%
212   \DN@##1{\expandafter\def\expandafter\tmp@\expandafter{##1}}%
213   \expandafter\next@\expandafter{\postShape@@}%
214   \DN@##1{\expandafter\gdef\expandafter\postXYtransform@@\expandafter{%
215     \postXYtransform@@ ##1}}\expandafter\next@\expandafter{\tmp@}}%
217 \xydef@\transformDrop@{\let\xy@transform@=\relax
218   \expandafter\def\expandafter\Drop@@\expandafter{%
219     \expandafter\preXYtransform@\Drop@@\postXYtransform@}}
221 \xydef@\transformConnect@{\let\xy@transform@=\relax
222   \expandafter\def\expandafter\Connect@@\expandafter{%
223     \expandafter\preXYtransform@\Connect@@\postXYtransform@}}
225 \xydef@\resetTransform@{\gdef\preXYtransform@@{} \gdef\postXYtransform@@{}}

```

Bug: The reference point does not move correctly in POSTSCRIPT when a shift modifier has been applied before a rotation. The object prints outside of its bounding `\rectangleEdge`. Fix this!!

Global macros are used, so that the same styles can be reused by successive objects without having to re-interpret `<shape>` modifiers, as described next.

Saving transformations Once specified for an `<object>`, the collection of transformations can be assigned a name, via `[><name>]`. The `<name>` here is any collection of letters or other characters up to the closing `]`. Subsequent use of `[><name>]`, with the same or other `<object>`s, will re-establish the saved transformations, acting on the new `<object>` with initial reference point appropriate to this `<object>`.

Note: Such namings are global and permanent. They are intended to allow a particular set of transformations to be easily repeated for different objects inside various pictures and diagrams within the same document.

```

254 \xydef@\xynametransform@#1{%
255   \DN@{\expandafter\gdef\expandafter#1\expandafter{\the\toks@}}\next@ }

```

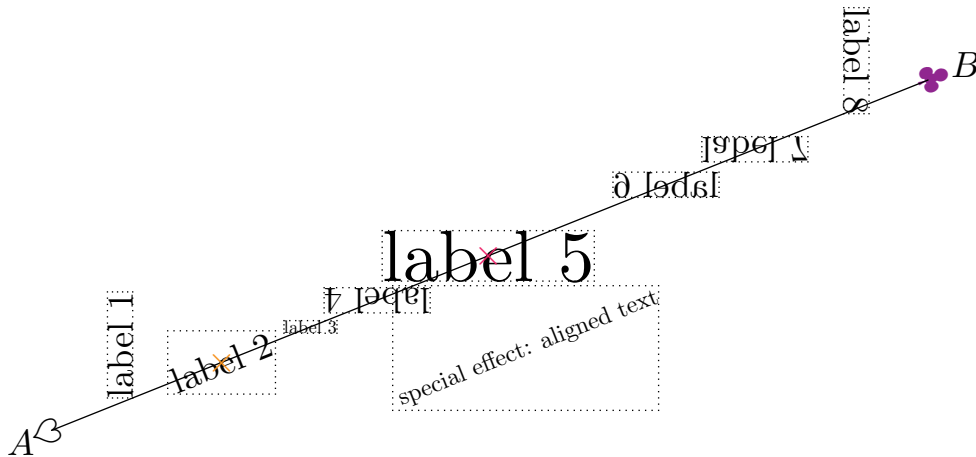

Figure 2.4: Rotations, scalings, and flips

Scaling and Scaled Text The `<shape>` modifier can contain either a single scale factor, or a pair indicating different factors in the x - and y -directions. Negative values are allowed, to obtain reflections in the coordinate axes, but not zero.

```

334 \xydef\xyshape@vflip@{\xyrescale@(1,-1)}
335 \xydef\xyshape@hflip@{\xyrescale@(-1,1)}

```

Rotation and Rotated Text Within [@ . . .] the . . . are parsed as a \langle direction \rangle locally, based on the current direction. The value of count register `\Direction` contains the information to determine the requested direction. When no \langle direction \rangle is parsed then [@] requests a rotation to align with the current direction.

The special sequence [@ ! . . .] is provided to pass an angle directly to the back-end. The Xy-pic size and shape of the \langle object \rangle with `\rectangleEdge` is unchanged, even though the printed form may appear rotated. This is a feature that must be implemented specially by the back-end. For example, using the POSTSCRIPT back-end, [@ ! 45] will show the object rotated by 45° inside a box of the size of the unrotated object.

```

356 \xydef@\xyrotatechar@{\bgroup
357 \afterDIRECTIONorEMPTY{\xyrotateSizeMod@}{\xyFN@\xySpecialRotate@i}}
359 \xydef@\xySpecialRotate@i{%

366 \else\ifx *\next \DN@*@\{\egroup\transformDrop@}%
367 \else \DN@{\xySpecialRotate@@}%
368 \fi\fi\fi\fi\fi \next@ }
370 \xydef@\getSpecialRotate@{\doSpecialRotate@@}

```

To Do: Provide example of repeated, named transformation.

Installation Initially there is no support for the actual effects. They will be processed according to size/shape requirements, but the actual rotation or re-sizing is omitted. A \langle driver \rangle file is required to implement the effects. It need to define alternative expansions to which `\xyRotate@@#1`, `\xySpecialRotate@@#1@`, `\doSpecialRotate@@#1@` and `\xyscale@@#1#2` can be bound.

```

Reflections Reflections can be specified by a combination of rotation and a flip — either [hflip] or [vflip].

```

455 \xydef@\xyshearchar@{\xyundefinedRotate@{shearing}}

```

Shear transformations To Do: Provide the structure to support these; then implement it in POSTSCRIPT.

The following diagram requires various options to be loaded and installed.

Example The diagram in figure 2.4 illustrates many of the effects described above as well as some additional ones defined by the `color` and `rotate` extensions.

Exercise 2.7: Suggest the code used by the author to typeset figure 2.4. (p.580)

The actual code is given in the solution to the exercise. Use it as a test of the capabilities of your DVI-driver. The labels should fit snugly inside the accompanying rectangles, rotated and flipped appropriately.

Bug: This figure also uses colours, alters line-thickness and includes some POSTSCRIPT drawing. The colours may print as shades of gray, with the line from *A* to *B* being thicker than normal. The wider band sloping downwards may have different width and length according to the DVI-driver used; this depends on the coordinate system used by the driver, when ‘raw’ POSTSCRIPT code is included.

2.6 Colour extension

Vers. 3.10 by Ross Moore (ross.moore@mq.edu.au)

This extension provides the ability to request that any object be displayed in a particular colour.

Figure 2.5: Colour names after `\UseCrayolaColors`.

It requires a suitable ‘driver’ option to provide the necessary `\special` commands to implement the effects. Thus

Using this extension will have no effect on the output unless used with a dvi-driver that explicitly supports it.

27 {Mathematics Department, Macquarie University, NSW~2109, Australia}

```

All effects defined in the `color` extension can be implemented using most POSTSCRIPT `<driver>`s, and some non-POSTSCRIPT ones, loaded using `\xyoption{xyps}`. This file provides ‘generic’ code which is known to work correctly with most drivers. For driver-specific variations, consult the appropriate `<driver>` file.

Colours are specified as a `<shape>` modifier which gives the name of the colour requested. It is applied to the whole of the current `<object>` whether this be text, an `XY-pic` line, curve or arrow-tip, or a composite object such as a matrix or the complete picture. However some DVI drivers may not be able to support the colour in all of these cases.

<code>[<colour name>]</code>	use named colour
<code>\newxycolor{<name>}{<code>}</code>	define colour
<code>\UseCrayolaColors</code>	load colour names (shown in figure 2.5)

If the DVI-driver cannot support colour then a request for colour only produces a warning message in the log file. After two such messages subsequent requests are ignored completely.

```

154 \xydef@{ \xycolorwarning@@{ \xycolormessage@
155 \gdef@{ \xycolorwarning@{ \xycolormessage@
156 \xywarning@{ ...no further colour warnings will be given.}%
157 \global\let@{ \xycolorwarning@= \relax }
158 \xylet@{ \xycolorwarning@= \xycolorwarning@@
159
160 \xydef@{ \xycolormessage@{ %
161 \xywarning@{ Current driver does not support colour. }%

```

There are two methods, perhaps used simultaneously, for handling requests for colour. The `\xylocalColor@` is the normal method, colouring whatever objects `TEX` typesets from fonts. The more specialized `\xycolor@` is used with the POSTSCRIPT back-end. This is necessary since some `<driver>`s assume that the current colour should be ‘black’ when the contents of a `\special` is interpreted, e.g. within POSTSCRIPT.

Thus a `<driver>` which supports both colour and POSTSCRIPT must define a method to handle `\xylocalColor@` but should leave alone `\xycolor@`. The latter method will be adjusted appropriately when a POSTSCRIPT `<driver>` is installed.

```

178 \xydef@{ \xyNoColor@#1{}
179 \xylet@{ \xycolor@@= \xyNoColor@
180 \xydef@{ \xyNoColor@@#1#2{ \xycolorwarning@}
181
182 \xydef@{ \xycolor@{ \xycolor@@}
183 \xylet@{ \xylocalColor@= \xyNoColor@@
184
185 \xydef@{ \UnloadColor@{ %

```

```

186 \let\xylocalColor@=\xyNoColor@@
187 % \let\xycolor@=\xyNoColor@
188 \let\xycolor@@=\xyNoColor@
189 \let\xycolorwarning@=\xycolorwarning@@ }
190 \xylet@\UnloadColor@@=\UnloadColor@
192 \xyaddunsupport{color}{\UnloadColor@@\relax}

```

This next macro is to inherit a default colour from the surrounding document, perhaps using one already defined by L^AT_EX 2_ε

```

199 \ifx\current@color\undefined \xydef@\xybasecolor@{ }%
200 \else \def\xybasecolor@{\current@color}\fi
202 %\xydef@\xycmath@{\hbox\bgroup\dimen@=.55ex \checkxycolor@ \xyinside@}
203 %\xydef@\xycnomath@{\hbox\bgroup\dimen@=\z@ \checkxycolor@ \xyinside@}
205 %\xydef@\checkxycolor@{\ifx\xybasecolor@\empty\else
206 % \expandafter\imposexycolor@\fi}
207 %\xydef@\imposexycolor@{\xylocalColor@}

```

A commonly used method is to maintain a colour-stack. The following commands are for use with such a setup, however they should only be called from code installed from a (driver)-file. Different drivers may do things differently; e.g. dvips uses a single `\special` via: `\def\xycolor@push@@#1{\special{color push #1}}` but Textures uses two: `\xydef@\xycolor@push#1{\special{color push #1}}\special{color #1}`. Since the colour-stack idea was proposed by Tomas Rokicki, the dvips method is the default behaviour.

```

220 \xydef@\xystackcolor@{\bgroup \DN@##1##2{\egroup}%
221 \ifInvisible@\else\ifHidden@\else\DNii@{\no@@}\ifx\nextii@\Connect@@
222 \else\DN@{\xystackcolor@i}\fi\fi\fi \next@ }
224 \xydef@\xystackcolor@i#1#2{\checkXyStyle@
225 \DN@{#2}\ifx\next@\empty
226 \def\tmp@##1{\DN@{\xycolor@push{#1}##1\xycolor@pop}}}%
227 \else\def\tmp@##1{\DN@{\xycolor@push{#2 #1}##1\xycolor@pop}}\fi
228 \toks@={\egroup \let\xy@style@=\relax \def\Drop@@}%
229 \expandafter\tmp@\expandafter{\Drop@@}%
230 \expandafter\addtotoks@\expandafter{\expandafter{\next@}\def\Connect@@}%
231 \expandafter\tmp@\expandafter{\Connect@@}%
232 \expandafter\addtotoks@\expandafter{\expandafter{\next@}}}%
233 \the\toks@ }%
235 \xydef@\xycolor@push@@#1{\special{color push #1}}
236 \xydef@\xycolor@pop{\special{color pop}}
237 \xylet@\xycolor@push=\xycolor@push@@

```

Named colours and colour models New colour names are created with `\newxycolor`, taking two arguments. Firstly a name for the colour is given, followed by the code which will ultimately be passed to the output device in order to specify the colour. If the current driver cannot support colour, or grayscale shading, then the new name will be recognised, but ignored during typesetting.

```

251 \xydef@\newxycolor#1#2{\newxyColor{#1}{-}{-}{#2}{-}}
252 \xydef@\newxyColor#1#2#3#4{\newxycolor@{#1}{#2}{#3}{#4}{-}}

```

For POSTSCRIPT devices, the X_Y-ps POSTSCRIPT dictionary defines operators `rgb`, `cmyk` and `gray` corresponding to the standard RGB and CMYK colour models and grayscale shadings. Colours and

shades are described as: *r g b* *rgb* or *c m y k* *cmky* or *s* *gray*, where the parameters are numbers in the range $0 \leq r, g, b, c, m, y, k, s \leq 1$. The operators link to the built-in colour models or, in the case of *cmky* for earlier versions of POSTSCRIPT, give a simple emulation in terms of the RGB model.

Existing color names can be overridden using `\newxycolor@#1#2\relax`.

```

318 \newxycolor@{blue}{0. 0. 1.}{rgb}{}\relax

```

```

319 \newxycolor@{cyan}{0. 1. 1.}{rgb}{\relax
320 \newxycolor@{magenta}{1. 0. 1.}{rgb}{\relax
321 \newxycolor@{yellow}{1. 1. 0.}{rgb}{\relax
322 \xyuncatcodes }

```

Note: The driver file must call `\xystandardcolors@` before these colours become accessible. This is to allow any `<driver>`-specific definitions to be active when these colours are defined.

Saving colour and styles When styles are saved using `[=<word>]`, see `,` then the current colour setting (if any) is saved also. Subsequent use of `[<word>]` recovers the colour and accompanying line-style settings.

Further colour names are defined by the command `\UseCrayolaColours` that loads the `crayon` option, in which more colours are defined. Consult the file `xyps-col.doc` for the colours and their specifications in the RGB or CMYK models.

```

346 \xydef@{\UseCrayolaColors{\xyrequire{crayon}\xyuncatcodes}%
347 % \xyinputorelse@{xyps-col}{\xyerror@{Could not load xyps-col}{}}}

```

`xycrayon.doc:`

This option provides the command to install definitions for the 68 colours recognised by name by Tomas Rokicki's `dvips` driver [12]. This command must be called from a `<driver>`-file which can actually support the colours.

POSTSCRIPT colour When POSTSCRIPT driver support is available, the method for handling colour within diagrams may be different. The reason for this is that some dvi-drivers reset the colour to black before placing the contents of the `\special`. To counter this, the POSTSCRIPT code maintains its own colour-stack. Support is established within a separate file `xyps-c.tex`, loaded from the appropriate `<driver>`-files.

2.7 Pattern and Tile extension

Vers. 3.7 by Ross Moore <ross.moore@mq.edu.au>

This extension provides the ability to request that a filled region be tiled using a particular pattern.

This is an effect not normally available within \TeX . Instead it requires a suitable <driver> option to provide the necessary `\special` commands, together with any extra commands needed to implement the effects. Thus

Using this extension will have no effect on the output unless used with a dvi-driver that explicitly supports it.

All effects defined in the `tile` extension can be implemented using most `POSTSCRIPT` <driver>s, loaded as `\xyoption{<driver>}`.

25 \xyprovide{tile}{Pattern and Tile extension}{\stripRCS$Revision: 3.7 $}%
26 {Ross Moore}{ross.moore@mq.edu.au}%
27 {Mathematics Department, Macquarie University, NSW~2109, Australia}

```

Like using color, tiling with patterns is an instance of a special style, since use of a pattern has no effect on the size or shape of the \langle object \rangle being typeset. It only affects how the \langle object \rangle will appear on the printed page or on-screen.

Figure 2.6: The 38 standard Macintosh patterns.

Patterns Patterns are specified as a \langle shape \rangle modifier, similar to the way colours are specified by name. The pattern is applied to the whole of the current \langle object \rangle whether this be text, an \Xy-pic line, curve or arrow-tip, or a composite object such as a matrix or the complete picture. However some DVI-drivers may not support use of patterns in all cases.

If the current DVI-driver cannot support patterns then a request for one simply produces a warning message in the log file. After two such messages subsequent requests are ignored completely.

```

```

[<name>]	use named pattern
\newxypattern{<name>}{<data>}	specify new pattern using <data>
\UsePatternFile{<file>}	sets default file for patterns
\LoadAllPatterns{<file>}	load all patterns in <file>
\LoadPattern{<name>}{<file>}	load named pattern from <file>
\AliasPattern{<alias>}{<name>}{<file>}	let <alias> denote pattern from <file>.

Although pattern data may be specified directly using `\newxypattern`, it is more usual to load it from a `<file>` in which many patterns are defined by name, each on a separate line. By convention such files always end in `.xyp` (XY-pattern) so no extension should be specified. The pattern is then requested using either the name supplied in the file or by an alias. Once `\UsePatternFile` has been used, then a null `<file>` argument to the other commands will still find patterns in the default file. The default remains in effect for the current level of $\text{T}_{\text{E}}\text{X}$ grouping.

For example, the following picture

uses ‘filled’ frames from the `frame` feature:

```
\AliasPattern{bricks}{mac12}{xymacpat}
\AliasPattern{bars}{mac08}{xymacpat}
\xy *+<5pc,3.1pc>{},{*[bricks]\frm{**}}
, *+<2.5pc>[o] {},*[bars]\frm{**}
\endxy
```

There are two methods, perhaps used simultaneously, for handling requests for a pattern. The `\xylocalpattern@` is the normal method, patterning whatever objects \TeX typesets from fonts or rules. The more specialized `\xypattern@` is used with a `POSTSCRIPT` \langle driver \rangle .

Thus a \langle driver \rangle which supports both pattern and `POSTSCRIPT` must define a method to handle `\xylocalpattern@` but should leave alone `\xypattern@`. The latter method will be adjusted appropriately when a `POSTSCRIPT` \langle driver \rangle is installed.

```
207 \xydef@\xyNopattern@#1{}
208 \xylet@\xypattern@@=\xyNopattern@
209 \xydef@\xyNopattern@@#1#2{\xypatternwarning@}
211 \xylet@\xypattern@@=\xypattern@@
212 \xylet@\xylocalpattern@@=\xyNopattern@@
```

This is to facilitate unloading patterns when the \langle driver \rangle is changed to one that does not support this feature. This is the default state, until an appropriate \langle driver \rangle is loaded.

```
220 \xydef@\Unloadpattern@{%
221 \let\xylocalpattern@@=\xyNopattern@@
222 \let\xypattern@@=\xyNopattern@
223 \let\xypatternwarning@@=\xypatternwarning@@ }
225 \Unloadpattern@
```

Pattern data A region is tiled using copies of a single ‘cell’ regularly placed so as to seamlessly tile the entire region. The \langle data \rangle appearing as an argument to `\newxypattern` is ultimately passed to the `dvi-driver`.

The simplest form of pattern data is: \langle num \rangle \langle Hex-data \rangle , where the data is a 16-character string of Hexadecimal digits; i.e. 0–9, *A–F*. Each Hex-digit equates to 4 binary bits, so this data contains 64 bits representing pixels in an 8×8 array. The \langle num \rangle is an integer counting the number of ‘0’s among the 64 bits. Taken as a fraction of 64, this number or its complement, represents the average density of ‘on’ pixels within a single cell of the pattern. Drivers unable to provide the fine detail of a pattern may simply use this number, or its complement, as a gray-level or part of a colour specification for the whole region to be tiled.

A desirable set of standard patterns could be specified to be always loaded. If such a set emerges indeed as being frequently desirable then it will be included here.

```
253 \xydef@\xystandardpatterns@{ }%
```

Note: The driver file must call `\xystandardpatterns@` before these patterns become accessible. This is to allow any \langle driver \rangle -specific definitions to be active when these patterns are defined.

```

The file `xymacpat.xyp` contains defining data for the 38 standard patterns available with the Macintosh Operating system. Figure 2.6 displays all these patterns.

Rotating and Resizing Patterns Some implementations of patterns are sufficiently versatile to allow extra parameters to affect the way the pattern data is interpreted. POSTSCRIPT is one such implementation in which it is possible to rotate the whole pattern and even to expand or contract the sizes of the basic cell.

Due to the raster nature of output devices, not all such requests can be guaranteed to produce aesthetic results on all devices. In practice only rotations through specific angles (e.g. 30°, 45°, 60°) and particular scaling ratios can be reliably used. Thus there is no sophisticated interface provided by Xy-pic to access these features. However the ‘POSTSCRIPT escape’ mechanism does allow a form of access, when a POSTSCRIPT <driver> is handling pattern requests.

Special POSTSCRIPT operators `pa` and `pf` set the pattern angle (normally 0) and ‘frequency’ measured in *cells per inch*. Hence, when used as an <object>-modifier, `[! 30 pa 18.75 pq]` rotates the pattern by 30° clockwise and uses a smaller pattern cell (larger frequency). The default frequency of $12.5 = 300/(8 \times 3)$ means that each pixel in a pattern cell corresponds, on a device of resolution 300dpi, to a 3×3 square of device pixels; on such a device 18.75 uses 2×2 squares.

At 300dpi a frequency of $9.375 = 300/(8 \times 4)$ uses 4×4 squares. These match the natural size for pixels on a 75dpi screen and are pretty close for 72dpi screens. Though appropriate for screen displays, these are ‘too chunky’ for high quality printed work. Doubling the frequency is too fine for some patterns, hence the intermediate choice of 12.5 as default. In order for printed output to match the screen view, a POSTSCRIPT operator `macfreq` has been defined to facilitate requests for 9.375, via `[!macfreq]`.

The next diagram displays changes to the frequency.

Saving patterns: When styles are saved using <word>], see note 1.4k of §1.4, then the current pattern (if any) is also saved. Subsequent use of `[<word>]` recovers the pattern as well as colour and line-style settings. This includes any explicit variations applied using the “Style Escape” mechanism.

Here is a variation of an earlier example, with extra effects.

```
\UsePatternFile{xymacpat}
\AliasPattern{bricks}{mac12}{}
\LoadPattern{mac28}{}\LoadPattern{mac05}{}
\xy *+0[! macfreq -45 pa] [mac28] [|=Bars]{}
, **<12pc, 4pc>{} * [bricks] \frm{**}
, -<3.5pc, 0pt>, **<2.65pc> [o] {}, * [Bars] \frm{**}
, * [thicker] \frm{o}, +<6pc, 0pt>
, **<5pc, 2.7pc> {}, * [mac05] \frm{**}, * \frm{-,}
, * [white] \txt\Large\bf\sf{Kilroy\was here}
\endxy
```

Add this extension to the driver-tables as “unload”, unless an already-loaded driver can support it:

```

422 \DN@{\xyaddunnsupport{tile}\Unloadpattern@}%
423 \ifx\xyeverystylewithoption@tile@\undefined
424 \else\ifx\xyeverystylewithoption@tile@\empty
425 \else
426 \DN@{\xysetup@@{\xywithoption{tile}{\xyeverystylewithoption@tile@\xydriversloaded@@}}}%
427 \fi\fi \next@

```

The end & Log

2.8 Import graphics extension

Vers. 3.12 by Ross Moore <ross.moore@mq.edu.au>

This feature provides the ability to easily add labels and annotations to graphics prepared outside \TeX or \LaTeX . An Xy-pic graphics environment is established whose coordinates match that within the

contents of the imported graphic, making it easy to specify exactly where a label should be placed, or arrow drawn to highlight a particular feature.

```

A command `\xyimport` is defined which is used, in conjunction with imported graphics, to establish a coordinate system appropriate to the particular graphics. This enables $\langle\text{pos}\rangle$ itions within the graphic to be easily located, either for labelling or adding extra embellishing features. It is used in either of the follow ways:

```

\xyimport(width,height){ $\langle\text{graphic}\rangle$ }
\xyimport(width,height)(x-off,y-off){ $\langle\text{graphic}\rangle$ }

```

Normally the $\langle\text{graphics}\rangle$ will be a box containing a graphic imported using the commands from packages such as `graphics`, `epsf` or `epsfig`, or using other commands provided by the local \TeX implementation. However the $\langle\text{graphic}\rangle$ could be *any* balanced \TeX material whatsoever; provided it occupies non-zero size, both vertically and horizontally.

The *width* and *height* are $\langle\text{number}\rangle$ s given in the coordinate system for the *contents of the* $\langle\text{graphics}\rangle$. These are not dimensions, but coordinate-lengths, using the units appropriate to the picture displayed by $\langle\text{graphic}\rangle$.

When provided, $(x\text{-off}, y\text{-off})$ give the distance in coordinate units from bottom-left corner to where the origin of coordinates should be located, usually within area covered by the $\langle\text{graphic}\rangle$. Usually the

Framed contents of graphics file.

Rational points on the elliptic curve: $x^3 + y^3 = 7$

Figure 2.7: Importing a graphic for labelling.

negatives of these numbers will give the coordinate location of the bottom-left corner of the `(graphic)`. If no offsets are supplied then the origin is presumed to lie at the bottom-left corner.

158 \idfromc@{import}\POS }

```

Normally the `\xyimport` command is used at the beginning of an `\xy..\endxy` environment. It is not necessary to give any basis setup, for this is deduced by measuring the dimensions of the `<graphic>` and using the supplied *width*, *height* and offsets. The `<graphic>` itself defines named `<pos>` called "import", located at the origin and having appropriate extents to describe the area covered by the `<graphic>`. This makes it particularly easy to surround the `<graphic>` with a frame, as on the left side of figure 2.7, or to draw axes passing through the origin.

Here is the code used to apply the labelling in figure 2.7:

```

\def\ellipA{\resizebox{6cm}{!}{%
  \includegraphics{import1.eps}}}
\xy
\xyimport(3.7,3.7)(1.4,1.4){\ellipA}*\frm{-}
,!D+<2pc,-1pc>*+!U\txt{%
  Framed contents of graphics file.}\endxy
\qqad\qqad
\xy\xyimport(3.7,3.7)(1.4,1.4){\ellipA}
,!D+<2pc,-1pc>*+!U\txt{Rational points
  on the elliptic curve:  $x^3+y^3=7$ }
,(1,0)*+!U{1},(-1,0)*+!U{-1}
,(0,1)*+!R{1},(0,-1)*+!R{-1}
,(2,-1)*+!RU{P},(-1,2)*+!RU{-P}
,(1.3333,1.6667)*+!UR{-2P}
,(1.6667,1.3333)*!DL{\;2P}
,(-.5,1.9)*+!DL{3P},(1.9,-.5)*!DL{\;-3P}
,(-1,2.3)*+!D{\infty}*0{},{\ar+(-.2,.2)}
,(.5,2.3)*+!D{\infty}*0{},{\ar+(-.2,.2)}
,(2.3,-1)*+!L{\infty}*0{},{\ar+(.2,-.2)}
\endxy

```

This example uses the $\text{\LaTeX} 2_{\epsilon}$ standard `graphics` package to import the graphics file `import1.eps`; other packages could have been used instead. e.g. `epsfig`, `epsf`, or the `\picture` or `\illustration`

commands in TEXTURES on the Macintosh.

The only possible problems that can occur are when the graphics package is loaded after X_Y-pic has been loaded. Generally it is advisable to have X_Y-pic loading *after* all other macro packages.

2.9 Movie Storyboard extension

Vers. 3.8 by Kristoffer H. Rose <krisrose@tug.org>

This extension interprets the `\scene` primitive of the `movie` class, setting the progress indicators to dummy values. The following assumes that you are familiar with the `movie` class.

Header:

```

```

The size of the frame is determined by the command

```
\MovieSetup{width=width,height=height,...}
```

(the ... indicate the other arguments required by the `movie` class but silently ignored by the `Xy-pic movie` extension).

Note: This extension still experimental and subject to change. The only documentation is in the `movie.cls` source file.

The implementation mimics the aspects of the `keyval` package needed here, namely reading the `height` and `width` parameters.

```

59 \xynew@{dimen}\m@height
60 \xynew@{dimen}\m@width
61
62 \xydef@extractparameter@#1#2#3{%

2.10 PostScript backend

Vers. 3.10 by Ross Moore <ross.moore@mq.edu.au>

Xy-ps is a ‘back-end’ which provides Xy-pic with the ability to produce DVI files that use POSTSCRIPT `\specials` for drawing rather than the Xy-pic fonts.

In particular this makes it possible to print Xy-pic DVI files on systems which do not have the ability to load the special fonts. The penalty is that the generated DVI files will only function with one particular DVI driver program. Hence whenever Xy-ps is activated it will warn the user:

Xy-pic Warning: The produced DVI file is *not portable*: It contains POSTSCRIPT `\specials` for <one particular> driver

A more complete discussion of the pros and cons of using this backend is included below.

```

2.10.1 Choosing the DVI-driver

Including `\xyoption{ps}` within the document preamble, tells Xy-pic that the POSTSCRIPT alternative to the fonts should be used, provided the means to do this is also specified. This is done by also specifying a dvi-driver which is capable of recognising and interpreting `\special` commands. Although the file `xyps.tex` is read when the option request is encountered, the macros contained therein will have no effect until an appropriate driver has also been loaded.

With L^AT_EX 2_ε both the backend and driver may be specified, along with other options, via a single `\usepackage` command, see [4, page 317]; e.g.

```
\usepackage[ps,textures,color,arrow]{xy}
```

The rebindings necessary to support POSTSCRIPT are not effected until the `\begin{document}` command is encountered. This means that an alternative driver may be selected, by another `\xyoption{<driver>}`, at any time until the `\begin{document}`. Only the macros relevant to last named `<driver>` will actually be installed.

The following table describes available support for POSTSCRIPT drivers. Please consult the individual driver sections in part 4 for the exact current list. For each `<driver>` there is a corresponding file named `xy<driver>.tex` which defines the necessary macros, as well as a documentation file named `xy<driver>.doc`. The spelling is all lower-case, designed to be both descriptive and unique for the 1st 8 characters of the file names.

<code><driver></code>	Description
<code>dvips</code>	Tomas Rokicki's DVIPS
<code>dvips</code>	Karl Berry's <code>dvipsk</code>
<code>dvips</code>	Thomas Kiffe's DVIPS for Macintosh
<code>textures</code>	Blue Sky Research's TEXTURES v1.7+
<code>16textures</code>	Blue Sky Research's TEXTURES v1.6
<code>oztex</code>	Andrew Trevorrow's OzTEX v1.8+
<code>17oztex</code>	Andrew Trevorrow's OzTEX v1.7

Other DVI-drivers may also work using one of these files, if they use conventions similar to `dvips`, `OzTEX` or `TEXTURES`. Alternatively it should not be too difficult to write the files required, using these as a basis indicating the type of information needed to support the specific `\special` commands. Anyone attempting to do this should inform the author and convey a successful implementation to him for inclusion within the X_Y-pic distribution.

Note: In some previous versions of X_Y-pic the POSTSCRIPT backend and driver were loaded simultaneously by a command of the form `\UsePSspecials{<driver>}`. For backward-compatibility these commands should still work, but now loading the latest version of the given `<driver>`. However their future use is discouraged in favour of the option-loading mechanism, via `\xyoption{<driver>}`. This latter mechanism is more flexible, both in handling upgrades of the actual driver support and in being extensible to support more general forms of `\special` commands.

Once activated the POSTSCRIPT backend can be turned off and on again at will, using the user following commands:

```

\NoPSspecials    cancels POSTSCRIPT
\UsePSspecials {} restores POSTSCRIPT

```

These obey normal T_EX scoping rules for environments; hence it is sufficient to specify `\NoPSspecials` within an environment or grouping. Use of POSTSCRIPT will be restored upon exiting from the environment.

The default level of POSTSCRIPT is [4], see below.

```

170 \xydef@UsePSspecials{\DNii@{[4]}\xyFN@UsePSspecials@i}
171 \xydef@UsePSspecials@i{%
172   \ifx \space\next \expandafter\DN@\space{\xyFN@UsePSspecials@i}%
173   \else\ifx [\next \DN@{##1}\DNii@{##1}\xyFN@UsePSspecials@i}%
174   \else\ifcat 5\noexpand\next \DN@##1{\DNii@{##1}\xyFN@UsePSspecials@i}%
175   \else\ifx\bgroup\next \DN@{\expandafter\UsePS@specials\nextii@}%
176   \else \DN@\UsePS@specials{[4]}%
177   \fi\fi\fi\fi \next@ }

```

To Do: There is redundancy between here and `\UsePSspecials@`. The value of `\setupxyPS@` POSTSCRIPT level could be set here rather than later in `\PSspecials@`.

```

185 \xydef@UsePS@specials#1#2{%
186   \ifx\empty\whichPSspecials@
187   \DN@{#2}\ifx\next@empty
188   \else

244 %\xylet@\UseTeXTexturesSpecials=\UseTexturesSpecials

```

```

250 \message{drivers,}

```

First the driver is specified by `\UsePSspecials{<driver>}`. This causes a special driver file to be read. Use of fonts is restored at any point by calling `\NoPSspecials`, after which use of POSTSCRIPT is re-instated by simply `\UsePSspecials`, without need of an argument. The commands described above for specific drivers are simply aliases for `\UsePSspecials@{<driver>}`.

Once the new bindings have been setup, then the use of `\specials` is governed by the value of the conditional `\ifPSspecials@`.

```

265 \xydef@{\loadPSdriver@#1#2{\xyinputorelse@{xy#1}%
266   {\xyrequire{#2}\expandafter\ifx\csname xy#2loaded\else %

```

Unloading the POSTSCRIPT-backend is handled by the `unload` (driver).

```
396 \xyaddunsupport{ps}{\csname UnloadPS@@\endcsname}
```

adding new drivers Other drivers can be added by including an appropriate control-sequence name for the driver at this point. The purpose of an expansion such as `\xydef@{OzTeX@}{\noexpand\OzTeX@}` is so that this name always refers to a unique token. The macro `\PSSpecials@@` defined below, detects this token and then calls up the appropriate macro to make the necessary bindings.

Thus adding a new driver involves 5 steps:

- 1 Define a new control sequence, as just explained.
- 2 Define appropriately named macros to generate the desired `\specials`. (See the existing ones for examples of what is needed here.)
- 3 Define a macro that will perform the appropriate bindings of the different classes of `\special`. (See the existing ones for examples of what is needed here.)
- 4 Determine how frequently the `Xy-ps` dictionary must be included within the PostScript file. Once (at the beginning) is the ideal, however it may be necessary to include it with every page—this is the case with `TEXTURES`. Also if the dictionary can be loaded as a header or prolog, determine whether this can be done only once or must be for each page. Also check whether a specific name is required, as with `OzTeX`.
- 5 Check to see whether the `\dumpPSdict` macro correctly writes the dictionary to a file. The `\endlinechar` can be important here.

`Xy-ps` works by rebinding existing control sequence names, in the `Xy-pic` kernel and extensions, to have new expansions. These new expansions may eventually typeset nothing, or at most an empty box; instead they use a `\special` command to place POSTSCRIPT code directly into the `.dvi` file (or DVI2 resources in the case of `TEXTURES` on the Macintosh). The new expansions alter the `TeX` processing, often simplifying it considerably hence leading to savings in both time and memory requirement.

It should not be possible to mix `\specials` intended for different drivers. Thus the first use of `\PSSpecials@` will establish which driver is required then rebinds `\UsePSSpecials@` so that no other driver can be used; subsequent attempts to use `\UsePSSpecials@` simply result in the same driver being reinstated.

```
447 \xydef@{PSSpecials@}{%
448   \ifx\next[\DN@{##1}]{\setxyPSlevel@{##1}\xyFN@{PSSpecials@}}%
449   \else\DN@{\whichPSSpecials@{PSSpecials@@}}%
450   \fi \next@ }%
452 \xydef@{PSSpecials@@}{%
453   \ifx\und@fined\PSmessage\hidePSmessages\fi \setupxyPS@}
```

An optional argument to the `\UsePSSpecials` command allows for some control over precisely when POSTSCRIPT `\specials` will be used. Similarly `\UseDVIPSpecials` and `\UseTexturesSpecials`, etc. can take an optional argument.

For example, `\UsePSSpecials[1]` replaces only font characters with a POSTSCRIPT drawing of the same character. Both the POSTSCRIPT and the bitmapped fonts should produce (virtually) identical printed images. This is primarily a test mode.

`\UsePSSpecials[2]` also only replaces font characters but such that the number of possible directions is 8192, so that arrowheads turns and hooks fit better.

`\UsePSspecials[3]` draws straight and dotted lines from a single `\special` command, and similarly for circle segments. The printed output should be identical to that obtained with `\UsePostScriptSpecials[2]`, but the size of the `.ps` file should be smaller.

`\UsePSspecials[4]` is the default level; all PostScript is turned on. Dotted curves use equally spaced dots, dashed curves have curved dashes; even dashed lines are better.

`\UsePSspecials[0]` does no rebinding of fonts at all. It allows the special effects, such as rotation, scaling, colour, etc defined in extensions, to be implemented while using the Xy-pic fonts.

```

```

2.10.2 Why use POSTSCRIPT

At some sites users have difficulty installing the extra fonts used by Xy-pic. The `.tfm` files can always be installed locally but it may be necessary for the `.pk` bitmap fonts (or the `.mf` METAFONT fonts) to be installed globally, by the system administrator, for printing to work correctly. If POSTSCRIPT is available then Xy-ps allows this latter step to be bypassed.

Note: with Xy-ps it is still necessary to have the `.tfm` font metric files correctly installed, as these contain information vital for correct typesetting.

Other advantages obtained from using Xy-ps are the following:

- Circles and circle segments can be set for arbitrary radii.
- solid lines are straighter and cleaner. They are no longer typeset as a collection of fixed-sized segments (drawn from the `xydash10` font). Previously special placement algorithms were required, to construct lines of arbitrary length in up to 8192 distinct directions, from the 128 characters in the font. These algorithms are no longer required, giving improved T_EX processing, as well as having smooth lines of arbitrary length and direction limited only by the resolution of the POSTSCRIPT device.
- The range of possible angles of directionals is greatly increased. For arrow tips, hooks, and turns, there are now 8192 possible orientations rather than just the 128 contained in the `xyatip10`, `xybtip10`, and `xybsql10` fonts.
- Spline curves are smoother. True dotted and dashed versions are now possible, using equally spaced segments which are themselves curved.
- The POSTSCRIPT file produced by a driver from an Xy-ps DVI file is in general significantly smaller than one produced by processing an ‘ordinary’ DVI file using the same driver. One reason for this is that no font information for the Xy-pic fonts is required in the POSTSCRIPT

file; this furthermore means that the use of X_Y-pic does not in itself limit the POSTSCRIPT file to a particular resolution.³

- The latest version of X_Y-pic now enables special effects such as variable line thickness, gray-level and colour. Also, rotation of text and (portions of) diagrams is now supported with some drivers. Similarly whole diagrams can be scaled up or down to fit a given area on the printed page. Future versions will allow the use of regions filled with colour and/or patterns, as well as other attractive effects.

Some of the above advantages are significant, but they come at a price. Known disadvantages of using X_Y-ps include the following:

- A DVI file with specials for a particular POSTSCRIPT driver can only be previewed if a previewer is available that supports exactly the same `\special` format. A separate POSTSCRIPT previewer will usually be required.

However recent versions of `xdvi` support viewing of POSTSCRIPT using either the GhostScript program or via “Display PostScript”. The POSTSCRIPT produced by X_Y-ps can be viewed this way

- DVI files created using X_Y-ps in fact lose their “device-independence”. So please do not distribute DVI files with POSTSCRIPT specials—send either the T_EX source code, expecting the recipient to have X_Y-pic ☺, or send a (compressed) POSTSCRIPT file.

The latter comment applies to files in which any special ‘back-end’ support is required, not just to POSTSCRIPT. Of course it can be ignored when you know the configuration available to the intended recipient.

POSTSCRIPT header file: With some DVI-drivers it is more efficient to have the POSTSCRIPT commands that X_Y-ps needs loaded initially from a separate “header” file. To use this facility the following commands are available...

```

\UsePSheader {}
\UsePSheader {<filename>}
\dumpPSdict {<filename>}
\xyPSdefaultdict

```

Normally it is sufficient to invoke `\UsePSheader{}`, which invokes the default name of `xy38dict.pro`, referring to the current version of X_Y-pic. The optional `<filename>` allows a different file to be used. Placing `\dumpPSdict{..}` within the document preamble causes the dictionary to be written to the supplied `<filename>`.

```

624 \DN@{\csname newif\endcsname\ifUsePSdict@@\DN@{}}
625 \ifx\undefined\UsePSdict@@true\else\DN@{\fi \next@
627 \ifx\undefined\xyPSdefaultdict

629 \DN@##1.##2.##3@{\gdef\xyPSdictname{xy##1##2dict.pro}}%
630 \expandafter\next@\xyversion.@}%
631 \fi

```

³Most T_EX POSTSCRIPT drivers store the images of characters used in the text as bitmaps at a particular resolution. This means that the POSTSCRIPT file can only be printed without loss of quality (due to bitmap scaling) at exactly this resolution.

```

633 \ifx\undefined\UsePSheader@
634 \xydef@\UsePSheader@#1{%
635   \DN@{#1}\ifx\next@\empty
636 %   \ifx\xyPSdictname\undefined\xyPSdefaultdict\fi

641   \UsePSdict@@true}%
642 \let\UsePSheader=\UsePSheader@
643 \fi

```

See the documentation for the specific driver to establish where the dictionary file should be located on any particular T_EX system. Usually it is sufficient to have a copy in the current working directory. Invoking the command `\dumpPSdict{}` will place a copy of the requisite file, having the default name, in the current directory. This file will be used as the dictionary for the current processing, provided it is on the correct directory path, so that the driver can locate it when needed. Consult your local system administrator if you experience difficulties.

The ‘dump’ cannot be performed until a driver has been installed. This ensures that the correct ‘end-of-line’ character is used.

```

662 \xydef@\dumpPSdict#1{\DN@{#1}\ifx\next@\empty
663   \ifx\undefined\xyPSdictname\xyPSdefaultdict\fi
664   \else \gdef\xyPSdictname{#1}\fi
665   \def\dumpPSdict@@{\writePSdict@@}%
666   \ifx\xydriversselected@@\empty\DN@{\xysetup@@\null@xy@ps}%
667   \else \DN@{\installxyps@x}\fi \next@}

```

Multiple instances of `\UsePSheader` and `\dumpPSdict` are possible, only the last will determine which file is used for the current document. The command `\xyPSdefaultdict` reverts to the default name.

Allowing an arbitrary `<filename>` with `\UsePSheader` is for flexibility, to accommodate systems that may impose special requirements on the filenames of files to be used as POSTSCRIPT header files. OzT_EX is one such. It also caters for advanced users of X_Y-pic who may wish to experiment with customised POSTSCRIPT to obtain new effects.

2.10.3 Hooking into X_Y-pic

```

688 \message{hooks,}

```

This next macro streamlines the rebinding process.

```

694 \gdef\xyPSalternative@#1#2{%
695   \expandafter\global\expandafter\let\csname origxy#2@\endcsname=#1%
696   \xdef#1{\noexpand\ifPSspecials@
697     \noexpand\expandafter\expandafter\noexpand\csname xyPS#2@\endcsname
698     \noexpand\else
699     \noexpand\expandafter\expandafter\noexpand\csname origxy#2@\endcsname
700     \noexpand\fi}}%

```

The commands `\setupxyPSlevelA@`, `\setupxyPSlevelB@`, `\setupxyPSlevelC@` and `\setupxyPSlevelD@` actually perform the rebindings. Each may be called precisely once, and each requires all lower levels are also set.

```

748 \xyPSalternative@{\splinedotted@}{splinedotted}}%
749 \gdef\setupxyPSlevelD@{\PSincrease@{4}}%
750 \setupxyPSlevelC@ }

```

The bindings are not performed until `\setupxyPS@` is called.

2.10.4 Kernel improvements

Directionals:

These macros standardise the way a character is described in POSTSCRIPT. First give the `\Direction` code then the operator name, which is just a simple character string. The modifiers `\xyPSfont@` and

`\xyPSsemifont@` are empty in all but the most primitive level of POSTSCRIPT usage. When non-empty they restrict to using only angles corresponding to actual font characters.

```
771 \xydef@\xyPSchar@#1{%
772   \PSmacro@{\the\Direction\space \xyPSfont@ #1}}
774 \xydef@\xyPSsemichar@#1{%
775   \PSmacro@{\the\Direction\space \xyPSsemifont@ #1}}
```

These macros provide POSTSCRIPT code to round a `\Direction` code to that corresponding to the nearest font character code, for Directional and semi-Directional fonts respectively.

```
783 \xydef@\xyPSfont@{f }%{xyfont }
784 \xydef@\xyPSsemifont@{fs }%{xysdfont }
```

Before any binding we save the original expansions of control-sequences whose names will be subject to rebinding. We give these first for each font.

tips Arrow heads in `\xyatipfont` and `\xybtipfont`

The tips are all set as zero-sized characters...

```
798 \xydef@\xyPStip@{\xyPSchar@{t}}%{\xyPSchar@{tip}}
799 %\xydef@\xyPSatip@{\xyPSchar@{a}}%{\xyPSchar@{atip}}
800 %\xydef@\xyPSbtip@{\xyPSchar@{b}}%{\xyPSchar@{btip}}
801 \xydef@\xyPSTip@{\xyPSchar@{/XT tt}}%{\xyPSchar@{Tip}}
802 \xydef@\xyPSTtip@{\setboxz@h\bgroup
803   \reverseDirection@line@ \wdz@=\z@ \ht\z@=\z@ \dp\z@=\z@
804   \kern-\L@c \boxz@ \kern\L@c \xyPSchar@{/Xt tT}}%{\xyPSchar@{Ttip}}
805 \xydef@\xyPSTip@eu@{\xyPSchar@{/ET tt}}%{\xyPSchar@{Tip}}
806 \xydef@\xyPSTtip@eu@{\setboxz@h\bgroup
807   \reverseDirection@line@ \wdz@=\z@ \ht\z@=\z@ \dp\z@=\z@
808   \kern-\L@c \boxz@ \kern\L@c \xyPSchar@{/ET tT}}%{\xyPSchar@{Ttip}}
```

The mechanism to handle Computer Modern tips is a little different. Here we must rebind `\xycm@` to avoid any calls to font names. When `\PSSpecialstrue` then we expand a macro which will look at the following token to decide which type of tip is required after `\tip@x`.

```
818 %\xydef@\xyPScmtips@{\xyPSalternative@{\xycm@}{cm}}%
819 \xydef@\xyPScm@tip@x@{\xyFN@\xyPScm@@}%
820 \xydef@\xyPScm@@@{%

863 \let\Ttip@xy=\Ttip@
864 \let\Ttip@cm=\Ttip@
865 \let\Ttip@eu=\Ttip@ }

```

hooks, turns and squiggles: squiggles from: `\xybysqlfont`

The hooks are zero-sized characters...

```

874 \xydef@\xyPShook@{\xyPSchar@{h}}%\xyPSchar@{hook}}
875 \xydef@\xyPSahook@{\xyPSchar@{ha}}%\xyPSchar@{ahook}}
876 \xydef@\xyPSbhook@{\xyPSchar@{hb}}%\xyPSchar@{bhook}}

```

...so are the turns...

```

882 \xydef@\xyPSaturn@{\xyPSchar@{ta}}%\xyPSchar@{aturn}}
883 \xydef@\xyPSbturn@{\xyPSchar@{tb}}%\xyPSchar@{bturn}}

```

This handles squiggles as individual characters. Squiggled connections should be handled separately, e.g. by having `\xyPSsquiggle@` set the connection by something like `\edef\Connect@@{\noexpand\xyPSsquiggle@}`

```

892 \xydef@\xyPSsquiggle@{\xyPSchar@{g}}%\xyPSchar@{squigl}}

```

To Do: define composite `\xyPSsquiggled@`

To Do: define composite `\xyPSdashesquiggled@`

dashes and stoppers: using characters from: `xydashfont`

A stopper contributes zero size. However a dash gets its size from the italic correction in the `xydashfont`, accessed here using `\origxyline@@`.

```

909 \xydef@\xyPSstopper@{\xyPSchar@{st}}%\xyPSchar@{stopper}}
911 %\xydef@\xyPSfliptrue@{\DN@{\xyPSsemichar@{true dash}}}
912 \xydef@\xyPSfliptrue@{\DN@{\xyPSsemichar@{T d}}}

```

```

914 \xydef@\xyPSdash@{%

2.11 TPIC backend

Vers. 3.6 by Ross Moore <ross.moore@mq.edu.au>

This option allows the Xy-pic fonts to be replaced by TPIC `\specials`, when used with a dvi-driver capable of supporting them. Extra capabilities include smoother lines, evenly spaced dotted/dashed curves, variable line-widths, gray-scale fills of circles, ellipses and polygonal regions.

```

Use of TPIC `\specials` offers an alternative to the Xy-pic fonts. However they require a dvi-driver that is capable of recognizing and interpreting them. One such viewer is `xdvik`, Karl Berry's modification to the `xdvi` viewer on UNIX⁴ systems running X-windows or a derivative. `dvipsk`, Karl Berry's modification to `dvips` also handles TPIC `\specials`, so `xdvik/dvipsk` is an good combination for quality screen-display and POSTSCRIPT printing.

Once loaded using `\xyoption{tpic}`, with an appropriate `<driver>` also specified either already or subsequently, the following commands are available to turn the TPIC backend off/on.

```

\NoTPICspecials  turns off TPIC specials.
\UseTPICspecials reinstates TPIC specials.

```

```

60 \xynew@{if}\ifTPICspecials@
61 \xydef@UseTPICspecials{\TPICspecials@true}
62 \xydef@NoTPICspecials{\TPICspecials@false}

```

There is a limit to the number of points allowable in a path. For paths constructed by Xy-pic, which includes spline curves, when the limit is reached the path is automatically flushed and a new path commenced. The following command can be used to customise this limit—initially set at 300 for use with XDVI—to suit alternative `<driver>`s.

```

\maxTPICpoints{<num>} set maximum for paths

```

```

```

⁴UNIX is a trademark of Bell Labs.

Each object involving TPIC `\specials` must set the style, using `\xytpic@set@` to store a macro as the expansion of `\xytpic@style@@`. Currently this is global, since a TPIC object must be completed once it has been started — perhaps this is not necessary.

Note that `\xytpic@set@` uses `\xdef`, but has a `\noexpand` in its expansion; this forces expansion of the argument, when there is one, to the control sequence passed as the first token following `\xytpic@set@`.

straight lines

spline curves Of the curves defined in the `xycurve` extension, only solid spline curves are supported. This is done by treating the spline as a polygon (poly-line) with many segments. The dotted or dashed variants do not work correctly.

Implementations of TPIC draw dashed polygons such that the start and finish of each segment is solid. Since these segments can be very short, the effect is simply to create a solid line. Similarly the shortness of the segments tends to give nothing at all for large portions of a dotted curve. What is needed is an implementation whereby the on/off nature of a dashed or dotted polygon is determined by the accumulated length, not the length along just the current segment.

2.12 em-TeX backend

Vers. 3.6 by Ross Moore <ross.moore@mq.edu.au>

Eberhard Matte's em-TeX implementation provides a suite of `\special` commands to facilitate the drawing of lines, both on-screen and with various printing devices. This 'back-end' extension allows the lines in Xy-pic diagrams to be drawn using these methods.

Note that this extension does not have to be used with em-TeX. Better results may be obtained using the POSTSCRIPT back-end and DVIPS <driver>, since a version of DVIPS is available for em-TeX. However, in particular for screen previewing purposes, it may be convenient to use this back-end. Furthermore note that DVIPS is capable of supporting em-TeX\specials.

27 {Mathematics Department, Macquarie University, NSW~2109, Australia}

```

Once loaded using `\xyoption{emtex}`, with an appropriate <driver> also specified either already or subsequently, the following commands are available to turn the em-TeX backend off/on.

```

\NoEMspecials  turns off em-TeX specials.
\UseEMspecials reinstates em-TeX specials.

```

```

58 \xynew@if\ifEMspecials@
59 \xydef\UseEMspecials{\EMspecials@true}
60 \xydef\NoEMspecials{\EMspecials@false}

```

```

68 \xydef@xyemtex@lineto{\xyEM@special{lineto}}
69 \xydef@xyemtex@moveto{\xyEM@special{moveto}}
70 \xydef@xyemtex@line#1{\xyEM@special{line #1}}
71 \xydef@xyemtex@point#1{\xyEM@special{point #1}}
72 \xydef@xyemtex@pen#1{\addtostyletoks@{\xyEM@special{linewidth #1}}}

```

The \specials These place the actual \specials and allow tracing:

```

78 {\catcode' :=12 \gdef\next#1{\special{em:#1}}}
79 \xylet@xyEM@special=\next
81 {\catcode' :=12 \gdef\next#1{%
82 \W@{EM:#1 (\the\X@p,\the\Y@p),(\the\X@c,\the\Y@c)}\special{em:#1}}}
83 \xylet@xyEM@noisy=\next
85 \xydef@NoisyEMTeX{\let\xyEM@special=\xyEM@noisy}

```

Currently these are not used by Xy-pic.

```

91 %\xydef@xyemtex@message#1{\xyEM@special{message #1}}
92 %\xydef@xyemtex@graph#1{\xyEM@special{graph #1}}

```

re-bindings This is similar to the mechanism used by the POSTSCRIPT back-end to rebind “hooks” to incorporate a switch according to the current value of \ifEMspecials@.

```

104 \xydef@EMalternative@#1#2{%
105 \expandafter\global\expandafter\let\csname origxy#2@\endcsname=#1%
106 \xdef#1{\noexpand\ifEMspecials@

```

This option contains two extensions of the Xy-pic kernel: A way to expand T_EX macros in object \langle modifier \rangle s, and a way to specify arbitrary polygons as the \langle shape \rangle of an object.

2.13.1 Expansion

The special syntax $e|(\text{macros})|$ is introduced in an object \langle modifier \rangle s and \langle coord \rangle inates. It expands the given T_EX \langle macros \rangle (with \backslash edef) before reinterpretation as a \langle modifier \rangle of \langle coord \rangle , respectively.

```

51 \def\expandbeforenext@#1{%
52   \DN@ e|##1|{\edef\tmp@{##1}\expandafter\xyFN@\expandafter#1\tmp@}%
53 }
54
55 \xylet@\xy@oldOBJECT@=\OBJECT@

70   \else
71     \DN@{\xy@oldCOORD@}\fi\fi
72   \next@}%
73 \let\COORD@=\xy@newCOORD@

```

This code may become part of the Xy-pic kernel at a certain point.

2.13.2 Polygon shapes

A polygon $\langle \text{shape} \rangle$ is specified as

[P: $\langle \text{pos} \rangle, \dots, \langle \text{pos} \rangle$]

where $[P:p_1, \dots, p_n]$ denotes the shape obtained by tracking the edge with each p_i a position relative to the object reference point. $\langle \text{vector} \rangle$ s and $\langle \text{corner} \rangle$ s can be used directly; otherwise use $-\text{p}$ to get the relative position.

Note: Do not use $\{ \}$ or $[]$ in the $\langle \text{pos} \rangle$ itions.

Bug: The algorithm assumes that the reference point is always inside the polygon.

It is possible to frame polygons is also possible.

```

2.14 LaTeX Picture extension

Vers. 3.5 by Kristoffer H. Rose <krisrose@tug.org>

This extension provides replacement commands for the \LaTeX picture environment commands `line` and `vector`. At the moment this option requires \LaTeX .

```

1 %% $Id: xypicture.doc,v 3.5 2010/06/10 18:45:50 krisrose Exp $
2 %%
3 %% Xy-pic ‘‘LaTeX Picture Mode’’ option.
4 %% Copyright (c) 199802010 Kristoffer H. Rose <krisrose@tug.org>
5 %%
6 %% This file is part of the Xy-pic package for graphs and diagrams in TeX.

26 {Kristoffer H.~Rose}{krisrose@tug.org}%
27 {IBM T.J.Watson Research Center, P.O.Box 704, Yorktown Heights, NY 10598, USA}

```

Next define some internal parameters.

```

41 \xynew@{dimen}\xyp@xsize
42 \xynew@{dimen}\xyp@ysize
43 \xylet@\xyp@arrow=\relax
45 {\xyuncatcodes\makeatletter
46  \gdef\xyp@tail{}
47  \gdef\xyp@mid{-}
48  \gdef\xyp@head{>}
49 }

```

Finally the actual command.

```

55 \xydef@\xyvector(#1,#2)#3{%
56  \xyp@xsize#3\relax
57  \ifnum#1<\z@\multiply\xyp@xsize\m@ne\fi
58  \xyp@ysize\xyp@xsize\relax
59  \ifnum#1=\z@
60    \xyp@xsize\z@
61    \ifnum#2<\z@\multiply\xyp@ysize\m@ne\fi
62  \else
63    \multiply\xyp@ysize#2\relax\divide\xyp@ysize#1\relax
64  \fi
65  \edef\xyp@arrow{\noexpand\arAT{\xyp@tail\xyp@mid\xyp@head}}%
66  \ifnum#1<\z@
67    \makebox(\xyp@xsize,\xyp@ysize){%
68      \begin{xy} 0;<\unitlength,\z@>:%
69      \xyp@arrow(\xyp@xsize,\xyp@ysize)
70      \end{xy}}%
71  \else
72    \xyp@arrow(\xyp@xsize,\xyp@ysize)\relax
73  \fi
74 }

```

Then the option ends:

```
80 \xyendinput
```

Finally `xypicture.doc` is maintained using RCS and thus contains the following revision log:

```

87 % $Log: xypicture.doc,v $

Chapter 3

Features

This chapter describes the options that support facilities that can be obtained using the kernel and extensions yet are much easier to obtain using the provided special syntax.

3.1 All features

Vers. 3.7 by Kristoffer H. Rose <krisrose@tug.org>

As a special convenience, this feature loads a subset of Xy-pic,¹ namely the extensions: `curve` (cf. §2.1), `frame` (§2.2), `tips` (§2.3), `line` (§2.4), `rotate` (§2.5), `color` (§2.6), and the following features: `matrix` (§3.5), `arrow` (§3.3), and `graph` (§3.6).

```
1 %% $Id: xyall.doc,v 3.7 2010/07/27 09:49:34 krisrose Exp $
2 %%
3 %% Xy-pic ‘‘All features’’ option.

```

3.2 Dummy option

Vers. 3.6 by Kristoffer H. Rose <krisrose@tug.org>

This option is provided as a template for new options, it provides neither features nor extensions but it does count how many times it is requested. Even though the option does nothing it still has a standard Xy-pic header:

```

1  %% $Id: xydummy.doc,v 3.6 2010/07/27 09:49:34 krisrose Exp $
2  %%
3  %% Xy-pic ‘‘Dummy’’ option.
4  %% Copyright (c) 1993-1996 Kristoffer H. Rose <krisrose@tug.org>
5  %%
6  %% This file is part of the Xy-pic package for graphs and diagrams in TeX.
7  %% See the companion README and INSTALL files for further information.
8  %% Copyright (c) 1991-2010 Kristoffer H. Rose <krisrose@tug.org>
9  %%
10 %% The Xy-pic package is free software; you can redistribute it and/or modify
11 %% it under the terms of the GNU General Public License as published by the
12 %% Free Software Foundation; either version 2 of the License, or (at your
13 %% option) any later version.
14 %%
15 %% The Xy-pic package is distributed in the hope that it will be useful, but
16 %% WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY
17 %% or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License
18 %% for more details.
19 %%
20 %% You should have received a copy of the GNU General Public License along
21 %% with this package; if not, see http://www.gnu.org/licenses/.
22 %%
23 \ifx\xyloaded\undefined \input xy \fi
24
25 \xyprovide{dummy}{Dummy option}{\stripRCS$Revision: 3.6 $}%
26 {Kristoffer H.~Rose}{krisrose@tug.org}%
27 {IBM T.~J.~Watson Research Center, P.O.~Box 704, Yorktown Heights, NY 10598 (USA)}

```

Next follows two declarations that are used to count the number of invocations:

```
44 \xynew@{count}\xydummyrequires@@
```

This is used by the option to output a message every time it is loaded with `\xyoption` or `\xyrequire`:

```
51 \xyeveryrequest{dummy}{\global\advance\xydummyrequires@@\@ne
52 \W@{The ‘dummy’ option was used \the\xydummyrequires@@\space times!}}
```

(`\W@` is an Xy-pic primitive that outputs its argument.)

Then the option ends:

```
60 \xyendinput
```

Finally `xydummy.doc` is maintained using RCS and thus contains the following revision log:

```
67 % $Log: xydummy.doc,v $

3.3 Arrow and Path feature

Vers. 3.8 by Kristoffer H. Rose <krisrose@tug.org>

This feature provides Xy-pic with the arrow paradigm presented in [13].

Note: `\PATH` command incompatibly changed for version 3.3 (the `\ar` command is unaffected).

The basic concept introduced is the *path*: a connection that *starts* from *c* (the current object), *ends* at a specified object, and may be split into several *segments* between intermediate specified objects that can be individually labelled, change style, have breaks, etc.

§3.3.1 is about the `\PATH` primitive, including the syntax of paths, and §3.3.2 is about the `\ar` customisation of paths to draw arrows using Xy-pic directional objects.

Header:

```

3.3.1 Paths

```
57 \message{path,}
```

The fundamental commands of this feature are `\PATH` and `\afterPATH` that will parse the `<path>` according to the grammar in figure 3.1 with notes below.

Parsing: `\afterPATH` sets up `\afterPATH@` and initialise all the actions (see note 3.3a below) before invoking the actual `<path>` parser. `\PATH` is just a dummy interface.

```

181 \xydef@PATH{\afterPATH{}}
182
183 \xylet@afterPATH@=\empty
184
185 \xydef@afterPATH#1{\save
186 \DN@##1{\def\afterPATH@{\restore \def\afterPATH@{##1}#1}}%
187 \expandafter\next@\expandafter{\afterPATH@}%
188 \let\PATHfail@@=\empty
189 \let\PATHbefore@@=\empty
190 \let\PATHafter@@=\empty
191 \let\PATHlabelsevery@@=\empty
192 \let\PATHlabelsnext@@=\empty
193 \let\PATHlabelslast@@=\empty
194 \xy@{\afterPATH{#1}}{\def\PATHslide@@{\z@}}%
195 \def\PATHcontinue@@{\xyFN@PATH@}%
196 \xyFN@PATH@}

```

`\PATH@` is the parser for `<path>`: it eats the `<path>` until it fails and then calls the ‘failure continuation’ which will eventually become `\empty` which ends the parsing. **Hack:** The `\ifPATHsingle@` switch switches the `<segment>` parsing *off*; this is used by the graph feature to parse stand-alone `<slide>` `<labels>` sequences.

```

207 \xynew@if{\ifPATHsingle@
208
209 \xydef@PATH@{%
210 \ifx \space@\next \expandafter\DN@\space{\xyFN@PATH@}%

```

222 \fi\fi\fi\fi \next@}

```

`\PATHsetting@` just reads an `<action>` or `<which>` determining which action stuff to set and then does it—we treat the failure continuation as an action here even though it is not, strictly speaking.

The four actions are explained in the appropriate notes below.

```

232 \xylet@PATHfail@@=\empty
234 \xylet@PATHbefore@@=\empty
235 \xylet@PATHafter@@=\empty

261 \fi\fi\fi\fi\fi\fi\fi\fi \next@}

```

Next the setup for straight segments including the last: they set `\PATHinit@@` to initialise, *i.e.*, slide, `\PATHextra@@` to do what is needed after the = action, and finally `\PATHpost@@` is set to any operations to be done after the entire segment is typeset but before the next is read. `\PATHcontinue@@` is used internally to distinguish the ordinary segments from the last.

```

272 \xylet@PATHinit@@=\empty
274 \xylet@PATHextra@@=\empty
275 \xylet@PATHpost@@=\empty
276 \xylet@PATHcontinue@@=\empty
278 \xydef@PATHstraight@{%

299 \ifPATHomitslide@@\else\advance\Y@p\dimen@ii\fi \advance\Y@c\dimen@ii
300 \PATHomitslide@@false \resetupDirection@}}

```

Setup for turning segments is in note 3.3f.

A $\langle \text{segment} \rangle$ is interpreted as follows after p has been set to the previous end object, c to the $\langle \text{pos} \rangle$ given at the start of the segment, and $\backslash\text{PATHslide}@@$ to the slide:

```

310 \xydef@PATHslide@@{\z@}
311 \xynew@{if}\ifPATHomitslide@@
313 \xydef@PATHsegment@{%
314 \addLT@\ifx\next
315 \addGT@{\addLT@\DN@##1}{%
316 \xy@{<##1>}{\dimen@=##1\relax \edef\PATHslide@@{\the\dimen@}}%
317 \xyFN@PATHsegment@@}%
318 \else \let\next@=\PATHsegment@@
319 \fi \next@}

```

1. Expand $\backslash\text{PATHinit}@@$ (for straight segments this just sets up the direction and applies the $\langle \text{slide} \rangle$).
2. Expand $\backslash\text{PATHaction}=\langle \text{stuff} \rangle$ as set using $\sim=\langle \text{stuff} \rangle$.
3. Sets $\backslash\text{PATHcontinue}@@$ to any continuation set with $\sim\langle \text{stuff} \rangle$.
4. Construct list of $\langle \text{labels} \rangle$ specified by the user through $\sim\langle \text{which} \rangle$ setup. Those applicable to the present segment are inserted before the user's $\langle \text{labels} \rangle$ in the sequence $\langle \text{>=}$.
5. Store p, c as start, end of segment.
6. Interpret $\langle \text{labels} \rangle$ (see below), including the ones added by the $\sim\langle \text{when} \rangle \dots \langle \text{setup} \rangle$.

$\backslash\text{PATHsegment}@@$ performs this except the last two points:

```

344 \xydef@PATHsegment@@{\PATHinit@@ \addEQ@PATHaction@PATHbefore@@ \PATHextra@@
345 \expandafter\toks@\expandafter{\PATHlabelsnext@@}\let\PATHlabelsnext@@=\empty
346 \expandafter\adddtoks@\expandafter{\PATHlabelsevery@@}%
347 \expandafter\def\expandafter\PATHlabels@@\expandafter{\the\toks@}%
348 \toks@={}\expandafter\xyFN@\expandafter\PATHlabels@PATHlabels@@}

```

$\backslash\text{PATHlabels@}$ parses all $\langle \text{labels} \rangle$ of a $\langle \text{segment} \rangle$. This sets $\backslash\text{PATHlabelit}@@$ to the operation building the label in question. Then some parsing stores the tokens $\langle \text{>}(.5)$ for each - in the $\langle \text{anchor} \rangle$ and finally passes control to the kernel $\langle \text{place} \rangle$ parser with these tokens as the head. This then in turn calls $\backslash\text{PATHit@}$ that parses $\langle \text{it} \rangle$ and applies the chosen operation. After the last we continue with the accumulated subsegment actions.

```

360 \xylet@PATHlabelit@@=\empty

```

```

362 \xydef@PATHlabels@{%
363 \ifx \space@next \expandafter\DN@\space{\xyFN@PATHlabels@}%
364 \else \ifx ~\next
365 \DN@##1{\xy@^{\let\PATHlabelit@@=\PATHlabelabove@@
366 \DNii@{\xyFN@PATHAnchor@}}%
367 \else \ifx _\next
368 \DN@##1{\xy@_{\let\PATHlabelit@@=\PATHlabelbelow@@
369 \DNii@{\xyFN@PATHAnchor@}}%
370 \else \ifx |\next

384 \DN@{\expandafter\nextii@\expandafter{\the\toks@}}%
385 \fi\fi \next@}
387 {\xyuncatcodes \gdef\next{<>(.5)}}
388 \xylet@PATHAnchor@toks=\next
390 \xylet@PATHHitshapes@@=\empty
392 \xydef@PATHHit@{\let\PATHHitshape@@=\empty \xyFN@PATHHit@i}
394 \xydef@PATHHit@i{%
395 \ifx \space@next \expandafter\DN@\space{\xyFN@PATHHit@i}%
396 \else \ifx *\next \DN@*##1##1{\PATHlabelit@{!C##1}}%
397 \else \addAT@\ifx\next \addAT@\DN@##1##1{\PATHlabelit@{\dir##1}}%
398 \else \ifx [\next \DN@[##1]{%
399 \expandafter\def\expandafter\PATHHitshape@@\expandafter{\PATHHitshape@@[##1]}%
400 \xyFN@PATHHit@i}%
401 \else \DN@{\PATHlabelit@{}}%
402 \fi\fi\fi\fi \next@}

```

The individual operations bound to `\PATHlabelit@@` are discussed as appropriate in the notes.

After the last break and label we typeset the last piece of the connection.

```

412 \xydef@PATHfinishsegments@{%
413 \ifx\PATHlabelsextra@@\relax \expandafter\PATHfinishsegments@i
414 \else
415 \expandafter\PATHlabelsextra@@ \fi}
417 \xydef@PATHfinishsegments@i{%
418 \xy@@{\Clast@@}\the\toks@ \toks@={}%
419 \xy@@\setupDirection@
420 \PATHpost@@ \PATHaction@/\PATHafter@@
421 \PATHcontinue@@}

```

Bug: The order of the breaks determines the order of the subsegments. This is maybe a feature.

Notes

3.3a. An $\langle\text{action}\rangle$ can be either of the characters =/. The associated $\langle\text{stuff}\rangle$ is saved and used to call

$$\backslash\text{PATHaction}\langle\text{action}\rangle\{\langle\text{stuff}\rangle\}$$

before and *after* each segment (including all $\langle\text{labels}\rangle$) for = and /, respectively.

The default $\backslash\text{PATHaction}$ macro just expands to “ $\backslash\text{POS}\langle\text{stuff}\rangle\backslash\text{relax}$ ” thus $\langle\text{stuff}\rangle$ should be of the form $\langle\text{pos}\rangle\langle\text{decor}\rangle$. The user can redefine this—in fact the $\backslash\text{ar}$ command described in §3.3.2 below is little more than a special $\backslash\text{PATHaction}$ command and a clever defaulting mechanism.

Here is the default $\backslash\text{PATHaction}$:

```
452 \xydef\PATHaction@default#1#2{\xy@\PATHaction#1{#2}}{\POS#2\relax}
453 \xylet\PATHaction=\PATHaction@default
```

It is called using $\backslash\text{PATHaction@}$ to expand the action control sequences back to their $\langle\text{stuff}\rangle$ first:

```
460 \xydef\PATHaction@#1#2{\expandafter\PATHaction\expandafter#1\expandafter{#2}}
```

3.3b. It is possible to include a number of default $\langle\text{labels}\rangle$ *before* the $\langle\text{labels}\rangle$ of the actual $\langle\text{segment}\rangle$ are interpreted, using $\sim\langle\text{which}\rangle\{\langle\text{labels}\rangle\}$. The specified $\langle\text{which}\rangle$ determines for which segments the indicated $\langle\text{labels}\rangle$ should be prefixed as follows:

$\langle\text{which}\rangle$	applied to...
<	next segment only
>	last segment only
=	every segment

(when several apply to the same segment they are inserted in the sequence $\langle\text{>+}\rangle$).

This is useful to draw connections with a ‘center marker’ in particular with arrows, *e.g.*, the ‘mapsto’ example explained below can be changed into a ‘breakto’ example: typing

```
\xy**{0}\PATH
~={**\dir{-}}
~>{|>*\dir{>}}
~+{|*\dir{/}}
'(10,1)**{1}'(20,-2)**{2}'(30,0)**{3}
\endxy
```

will typeset

$$0 \dashrightarrow 1 \dashrightarrow 2 \dashrightarrow 3$$

Note, however, that what goes into $\sim\{\dots\}$ is $\langle\text{labels}\rangle$ and thus not a $\langle\text{pos}\rangle$ – it is not an action in the sense explained above.

3.3c. Specifying $\sim\{\langle\text{stuff}\rangle\}$ will set the “failure continuation” to $\langle\text{stuff}\rangle$. This will be inserted when the last $\langle\text{segment}\rangle$ is expected—it can even replace it or add more $\langle\text{segment}\rangle$ s, *i.e.*,

```
\xy **{0} \PATH ~={**\dir{-}}
~{'(20,-2)**{2}'(30,0)**{3}}'(10,1)**{1}
\endxy
```

is equivalent to

```
\xy **{0} \PATH ~={**\dir{-}}
  '(10,1)**{1} '(20,-2)**{2} (30,0)**{3}
\endxy
```

typesetting

because when `\endxy` is seen then the parser knows that the next symbol is neither of the characters `~'` and hence that the last $\langle \text{segment} \rangle$ is to be expected. Instead, however, the failure continuation is inserted and parsed, and the $\langle \text{path} \rangle$ is finished by the inserted material.

Failure continuations can be nested:

```
\xy **{0} \PATH ~={**\dir{-}}
  ~{~{(30,0)**{3}}
  '(20,-2)**{2} '(10,1)**{1}
\endxy
```

will also typeset the connected digits.

3.3d. A “straight segment” is interpreted as follows:

1. First p is set to the end object of the previous segment (for the first segment this is c just before the path command) and c is set to the $\langle \text{pos} \rangle$ starting the $\langle \text{segment} \rangle$, and the current $\langle \text{slide} \rangle$ is applied.
2. Then the $=$ and $<$ *segment actions* are expanded (in that sequence) and the $<$ action is cleared. The resulting p and c become the *start* and *end* object of the segment.
3. Then all $\langle \text{labels} \rangle$ (starting with the ones defined as described in note 3.3b below).

The code expanding the actions is part of the parsing above.

3.3e. A *segment* is a part of a $\langle \text{path} \rangle$ between a previous and a new *target* given as a $\langle \text{path-pos} \rangle$: normally this is just a $\langle \text{pos} \rangle$ as described in §1.3 but it can be changed to something else by changing the control sequence `\PATHafterPOS` to be something other than `\afterPOS`.

```
587 \xylet\PATHafterPOS@default=\afterPOS
588 \xylet\PATHafterPOS=\PATHafterPOS@default
```

3.3f. A *turning* segment is one that does not go all the way to the given $\langle \text{pos} \rangle$ but only as far as required to make a turn towards it. The c is set to the actual turn object after a turning segment such that subsequent turning or other segments will start from there, in particular the last segment (which is always straight) can be used to finish a winding line.

What the turn looks like is determined by the $\langle \text{turn} \rangle$ form:

$\langle \text{empty} \rangle$ Nothing between the `'` and the $\langle \text{pos} \rangle$ is interpreted the same as giving just the $\langle \text{diag} \rangle$ last used *out* of a turn.

$\langle \text{diag} \rangle$ Specifying a single $\langle \text{diag} \rangle$ d is the same as specifying either of the $\langle \text{cir} \rangle$ cles d^{\wedge} or d_{-} , depending on whether the specified $\langle \text{pos} \rangle$ has its center ‘above’ or ‘below’ the line from p in the $\langle \text{diag} \rangle$ onal direction.

$\langle\text{cir}\rangle$ When a full explicit $\langle\text{cir}\rangle$ is available then the corresponding $\langle\text{cir}\rangle$ object is placed such that its ingoing direction is a continuation of a straight connection from p and the outgoing direction points such that a following straight (or last) segment will connect it to c (with the same slide).

Here is an example using all forms of $\langle\text{turn}\rangle$ s:

was typeset by

```
\xy <4pc,0pc>:(0,0)
**\txt{base}="base"
\PATH ~={**\dir{-}?*\dir{>}}
  'l (-1,-1)*{A} ^a
  ' (1,-1)*{B} ^b
  ' _ul (1,0)*{C} ^c
  ' ul^l "base" ^d
  "base" ^e
\endxy
```

Bug: Turns are only really reasonable for paths that use straight lines like the one above.

Note: Always write a valid $\langle\text{pos}\rangle$ after a $\langle\text{turn}\rangle$, otherwise any following \wedge or $_$ labels can confuse the parser. So if you intend the $\wedge r$ in $\wedge r$ to be a label then write $\wedge, \wedge r$, using a dummy $\langle\text{pos}\rangle$ position.

We need to keep track of the current *in* and *out* $\langle\text{diag}\rangle$ directions as well as the current radius.

```
659 \xydef@{\PATHlastout@@{3}}
```

The startup routine is just a selection of the two kinds of $\langle\text{turn}\rangle$ s:

```
665 \xydef@{\PATHturn@{\afterCIRorDIAG\PATHturn@cir\PATHturn@diag}}
```

In both cases the trick is to set up a $\backslash\text{PATHinit}@@$ method that typesets the right circle segment at the right location. The simplest one is when there is a full $\langle\text{cir}\rangle$ available because that should just be used directly. The only complication is that we forbid 180° turns:

```
675 \xydef@{\PATHturn@cir{\toks@={\xy@@{
676 \count@=\CIRin@@ \ifnum\count@<4\else\advance\count@-4\fi
677 \count@@=\CIRout@@ \ifnum\count@@<4\else\advance\count@@-4\fi

682 \expandafter\PATHturn@i\next@}
```

Procedure for $\langle\text{diag}\rangle$ turns: Builds initial part of $\backslash\text{PATHinit}@@$ that computes the missing *orient* and *out* from *in* and the c passed through the segment. This initial segment should set *orient* as

follows:

i.e., as the sign of the inner product $\vec{pc} \cdot \hat{in}$, and set *out* as for the `<cir>`cle *in orient*.

```

702 \xydef\PATHturn@diag{\toks@={\xy@@{%
703   \setupDirection@ \count@=\CIRin@@ \dimen@=\xydashl@ \ABfromdiag@
704   \ifdim \sinDirection\A@>\cosDirection\B@ \def\CIRorient@@{\CIRacw@}%
705   \advance\count@\ifnum\count@<6 \tw@ \else -6\fi
706   \else \def\CIRorient@@{\CIRcw@}%
707   \advance\count@\ifnum\count@>\@ne -\tw@ \else 6\fi
708   \fi
709   \edef\CIRout@@{\the\count@}}}%
710 \edef\next@{{\CIRin@@}{}}}%
711 \expandafter\PATHturn@i\next@}

```

`\PATHturn@i` is where `\PATHinit@@` is defined to do the following:

- 1.773 Setup the default *in*, *orient*, and *out* as defined by the call from the above macros. Set *radius* parameter to the current *turnradius* value. The commands in `\toks@` are run to do any last-minute fixing of the defaults.
- 1.777 The segment will leave *p* in direction *in* and pretend to be meeting *c* in direction *out*. Thus the center of the `<cir>` object to be used for the actual `<turn>` object is located at the intersection of the line through $p + radius\hat{v}_{in}$ in direction \vec{v}_{in} and the line through $c + radius\hat{v}_{out}$ in direction \vec{v}_{out} . Here we compute $p + R\hat{v}_{in}$ using $R = radius$ if this is the initial turn and $R = radius \pm slide$ if it is a continuation turn.
- 1.780 Save *p* and *base* for later.
- 1.783 Compute $c + radius\hat{v}_{out}$ and use the kernel `\intersect@` primitive to compute the turn circle segment center.
- 1.791 However, if the intersection point lies on the ‘wrong side’ of *p*, *i.e.*, if $\vec{pc} \cdot in$ is negative, then we should not use the intersection point but the point as close to *p* as possible because the connection from *p* to the turn should at least have zero length—in fact we set it to have 8sp length to make sure that a sugsegment is typeset!
- 1.804 Modify *radius* to use for the actual circle segment by the *slide*: either positively (for *orient* `_`) or negatively (for *orient* `^`), and drop the circle segment (bypassing `\cir` to use the internal settings from above).
- 1.807 Store in `\PATHpostpos@@` the true end of the circle segment and code to prevent the application of the *slide* for the start of the next `<segment>`.
- 1.813 Move *c* to true beginning of the circle segment.
- 1.816 Restore saved *p* and *base*, and slide *p* finally.

The final macro takes care of the v2.6 format for changing *turnradius*: using $\langle \text{dimen} \rangle$ right after the $\langle \text{turn} \rangle$.

```
832 \xydef@\PATHturn@ii{%
833 \ifx /\next
834 \DN@ /{\afterassignment\nextii@\dimen@}%
835 \DNii@{%
836 \edef\next@{\noexpand\xy@{\edef\noexpand\turnradius@{\the\dimen@}}}\next@
837 \xy@\pfromc@ \PATHafterPOS{\xyFN@\PATHsegment@}}%
838 \else \DN@{\xy@\pfromc@ \PATHafterPOS{\xyFN@\PATHsegment@}}\fi
839 \next@}
```

This just stores a $\langle \text{diag} \rangle$ vector of the specified length in $\langle A, B \rangle$ thus acting as an optimised version of $\backslash \text{Directionfromdiag@}$:

```
847 \xydef@\ABfromdiag@{\ifcase\count@\relax
848 \A@=-.7071\dimen@ \B@=-.7071\dimen@ \or \A@=\z@ \B@=-\dimen@
849 \or \A@=+.7071\dimen@ \B@=-.7071\dimen@ \or \A@=\dimen@ \B@=\z@
850 \or \A@=+.7071\dimen@ \B@=+.7071\dimen@ \or \A@=\z@ \B@=+\dimen@
851 \or \A@=-.7071\dimen@ \B@=+.7071\dimen@ \or \A@=-\dimen@ \B@=\z@
852 \else\xybug@{impossible <diag>?}\fi}
```

The default used for *turnradius* can be set by the operation

$$\backslash \text{turnradius} \langle \text{add op} \rangle \{ \langle \text{dimen} \rangle \}$$

that works like the kernel $\backslash \text{objectmargin}$ etc. commands; it defaults to 10pt.

```
868 \xydef@\turnradius@{10pt}
870 \xydef@\turnradius@{\afterADDOP{\Addop@@\turnradius@}}
```

Exercise 3.1: Typeset

using $\langle \text{turn} \rangle$ s.

(p.581)

3.3g. The last segment is exactly as a straight one except that the \rangle action (if any) is executed (and cleared) just after the \langle action.

(The code implementing this is merged with the parsing.)

3.3h. “Sliding” a segment means moving each of the p, c objects in the direction perpendicular to the current direction at each.

(The code implementing this is merged with the parsing, using the $\backslash \text{PATHslide@@}$ control sequence to hold the current slide.)

3.3i. Labelling means that $\langle \text{it} \rangle$ is dropped relative to the current segment using a $\langle ? \rangle$ $\langle \text{pos} \rangle$ position. This thus depends on the user setting up a connection with a $\langle ** \rangle$ $\langle \text{pos} \rangle$ as one of the actions—typically the $\langle = \rangle$ action is used for this (see note 3.3d for the details). The only difference between $\hat{}$ and $\subscript{}$ is that they shift the label in the $\hat{}$ respectively $\subscript{}$ direction; for straight segments it is placed in the “superscript” or “subscript” position.

The operations used by `\PATHlabel@` to put labels above and below (with `^` and `_`) are trivial, taking two arguments and placing the label immediately; for convenience the `\drop` head are named separately such that they may be redefined:

```

933 \xydef@{\PATHlabelabove@#1#2{\droplabel@belowDirection@{#1}{#2}}%
934 \let\afteraliases@=\empty \xyFN@{\PATHlabelalias@}
936 \xydef@{\PATHlabelbelow@#1#2{\droplabel@aboveDirection@{#1}{#2}}%
937 \let\afteraliases@=\empty \xyFN@{\PATHlabelalias@}

943 \DN@{#2}\ifx\next@\empty
944 \expandafter\xy@@ix@\expandafter{\PATHHitshape@@\labelbox{#3}}}%
945 \else \expandafter\xy@@ix@\expandafter{\PATHHitshape@@#2{#3}}\fi
946 \xy@@{\setbox\z@=\expandafter\object\the\toks9 %
947 \advance\L@c\labelmargin@ \advance\R@c\labelmargin@
948 \advance\D@c\labelmargin@ \advance\U@c\labelmargin@
949 \setboxz@h{\kern\labelmargin@\boxz@\kern\labelmargin@}%
950 \A@=\X@c \B@=\Y@c #1\xydashl@ \the\Edge@c\thr@@
951 \advance\A@-\X@c \advance\B@-\Y@c \advance\X@c 2\A@ \advance\Y@c 2\B@
952 \ht\z@=\U@c \dp\z@=\D@c \dimen@=\L@c \advance\dimen@\R@c \wd\z@=\dimen@
953 \setbox\lastobjectbox@=\hbox{\X@c=\L@c \Y@c=\z@ \Drop@@}%
954 \drop@{\box\lastobjectbox@}{}%
955 \leave@}}
957 \xydef@{\PATHlabelbreak@#1#2{%
958 \DN@{#1}\ifx\next@\empty \drop\labelbox{#2}\else \drop#1{#2}\fi
959 \def\afteraliases@{\xy@@\Cbreak@@}\xyFN@{\PATHlabelalias@}

```

These emulate the effect of the `<modifier>s !C +<2labelmargin> <perp> !P <unperp>` where `<perp>`, `<unperp>` are `^`, `_` for `^`-labels and `_`, `^` for `_`-labels. The last hack using `\lastobjectbox@` aims at both setting that right and setting the label as an object (such that modifiers take effect) even though its placement is peculiar.

Labels will be separated from the connection by the *labelmargin* that you can set with the operation

$$\backslash labelmargin \langle add\ op \rangle \{ \langle dimen \rangle \}$$

that works like the kernel `\objectmargin` command; in fact *labelmargin* defaults to use *objectmargin* if not set.

```

983 \xylet@{\labelmargin@=\objectmargin@
985 \xydef@{\labelmargin{\afterADDOP{\Addop@@\labelmargin@}}

```

3.3j. Breaking means to “slice a hole” in the connection and insert `<it>` there. This is realized by typesetting the connection in question in *subsegments*, one leading to the break and one continuing after the break as described in notes 3.3a and 3.3d.

The special control sequence `\hole` is provided to make it easy to make an empty break.

```

1001 \xydef@{\hole{\hbox{\dimen@=\objectmargin@ \kern2\dimen@
1002 \vrule height\dimen@ depth\dimen@ width\z@}}

```

Subsegments are typeset using the ‘`\Cbreak@@`’ method.

3.3k. Unless $\langle it \rangle$ is a full-fledged $\langle object \rangle$ (by using the $*$ form), it is typeset using a `\labelbox` object (initially similar to `\objectbox` of basic \Xy-pic but using `\labelstyle` for the style).

Remark: You can only omit the `\}`s around single letters, digits, and control sequences.

```
1022 \xylet@ \labelstyle=\scriptstyle
1023 \xydef@ \labelbox#1{\hbox{\$@m@th\labelstyle{#1}$}}
```

3.3l. A label is an object like any other in the \Xy-pic picture. Inserting an $\langle alias \rangle = "\langle id \rangle"$ saves the label object as `"\langle id \rangle"` for later reference.

Exercise 3.2: Typeset

(p.581)

```
1050 \xydef@ \PATHlabelalias@{%
1051 \ifx \space@ \next \expandafter \DN@ \space{ \xyFN@ \PATHlabelalias@ }%
1052 \else \addEQ@ \ifx \next
1053 \addEQ@ \DN@ "##1" { \savealias@ {##1} \xyFN@ \PATHlabelalias@ }%
1054 \else \DN@ { \afteraliases@ @ \PATHlabels@ } \fi \fi \next@ }
1056 \xylet@ \afteraliases@ @ = \empty

1058 % { \xyuncatcodes \gdef \next#1 { \POS !C = "#1" \relax } }
1059 \xydef@ \savealias@ #1 { \xy@ @ { \enter@ \cfromthec@
1060 \advance \X@c - \L@c \advance \L@c \R@c \L@c = .5 \L@c \R@c = \L@c \advance \X@c \L@c
1061 \advance \Y@c - \D@c \advance \D@c \U@c \D@c = .5 \D@c \U@c = \D@c \advance \Y@c \D@c
1062 \idfromc@ {#1} \leave@ } }
```

3.3.2 Arrows

```
1181 \message{ \string \ar , }
```

Arrows are paths with a particularly easy syntax for setting up arrows with *tail*, *stem*, and *head* in the style of [13]. This is provided by a single $\langle decor \rangle$ decoration the syntax of which is described in figure 3.2 (with the added convention that a raised $*$ means 0 or more repetitions of the preceding nonterminal).

Parsing: The `\ar` command effectively translates the $\langle arrow \rangle$ into a `\PATH` command that initialises the tail, stem, and head of it as required to get the desired $\langle arrow \rangle$.

The translation of the $\langle arrow \rangle$ is saved in the following variables:

```
1202 \xylet@ \arvariant@ @ = \empty
1203 \xylet@ \arstemprefix@ @ = \empty
1204 \xylet@ \artail@ @ = \empty

Notes

3.3m. Building an \langle arrow \rangle is simply using the specified directionals (using \backslash dir of §1.6.1) to build a path: the first \langle tip \rangle becomes the *arrow tail* of the arrow, the \langle conn \rangle ection in the middle becomes the *arrow stem*, and the second \langle tip \rangle becomes the *arrow head*. If a \langle variant \rangle is given before the $\{$ then that variant \backslash dir is used for all three. For example,

```
\xy\ar @^{(->)} (20,7)\endxy
```

typesets

Exercise 3.3: Typeset these arrows:

(p.581)

The above is a flexible scheme when used in conjunction with the kernel \backslash newdir to define all sorts of arrowheads and -tails. For example,

```

\newdir{>}{!/4.5pt/\dir{}}
*: (1,-.2)\dir^{>}
*: (1,+2)\dir_{>}

```

defines a new arrow tip that makes

```

\xy (0,0)*+{A}
\ar @{>} (20,3)*+{B}

```

`\endxy`
`typeset`

Notice that the fact that the directional uses only `<tipchar>` characters means that it blends naturally with the existing tips.

Exercise 3.4: Often tips used as ‘tails’ have their ink on the wrong side of the point where they are placed. Fortunately space is also a `<tipchar>` so we can define `\dir{ >}` to generate a ‘tail’ arrow. Do this such that

```
\xy (0,0)*+{A}="a", (20,3)*+{B}="b"
\ar @{>->} "a";"b" < 2pt>
\ar @{ >->} "a";"b" <-2pt>
\endxy
```

typesets

(p.581)

3.3n. Specifying a `<dir>` as a `<tip>` or `<conn>` means that `\dir<dir>` is used for that `<tip>` or `<conn>`. For example,

```
\xy\ar @{<^{|}>} (20,7)\endxy
```

typesets

When using this you must specify a `{}` dummy `<dir>`ctional in order to ignore one of the tail, stem, or tip components, *e.g.*,

```
\xy\ar @{{}{+}>} (20,7)\endxy
```

typesets

In particular `*<object>` is a `<dir>` so any `<object>` can be used for either of the tail, stem, or head component:

```
\xy\ar @{*{x}*{y}*{z}} (20,7)\endxy
```

typesets

Note: A `*` introduces an `<object>` whereas the directional `‘•’` is typeset by the `<dir>` `{*}`.

Exercise 3.5: Typeset

using only one `\ar` command.

(p.581)

- 3.3o. *Curving* the arrow using $/d\ell/$, where d is a \langle direction \rangle and ℓ a \langle dimen \rangle sion, makes the stem a curve which is similar to a straight line but has had it's center point 'dragged' the distance ℓ in d :

was typeset by

```
\xy
\POS (0,10) *\cir<2pt>{} ="a"
      , (20,-10)*\cir<2pt>{} ="b"
\POS"a" \ar @/^1ex/ "b"|\uparrow
\POS"a" \ar @/_1ex/ "b"|\downarrow
%
\POS (20,10) *\cir<2pt>{} ="a"
      , (40,-10)*\cir<2pt>{} ="b"
\POS"a" \ar @/u1ex/ "b"|u
\POS"a" \ar @/d1ex/ "b"|d
\endxy
```

ℓ defaults to .5pc if omitted.

This is really just a shorthand for curving using the more general form described next: $@/d\ell/$ is the same as $@\{\{*\}\} ?+/d\ 2\ell /$ which makes the (quadratic) curve pass through the point defined by the \langle pos \rangle $\{*\}\} ?+/d\ell/$.

```
1671 \xydef@{\ar@curveslash/#1/{\expandafter\ar@curve@\ar@slashing{#1}}
1673 \xydef@{\ar@slashing#1{\xy@{\*\}\} ?+/#1/+/#1/ @+c}{\setupDirection@
1674 \vfromslide@{#1}%
1675 \X@c=2\X@c \advance\X@c\X@p \advance\X@c.5\d@X
1676 \Y@c=2\Y@c \advance\Y@c\Y@p \advance\Y@c.5\d@Y
1677 \czeroEdge@
1678 \spushc@}}}
```

- 3.3p. Using $@(d_2, d_2)$ where d_1, d_2 are simple \langle direction \rangle s (as described in note 1.4l except it is not possible to use $()$ s) will typeset the arrow curved such that it leaves the source in direction d_1 and enters the target from direction d_2 .

Exercise 3.6: Typeset

(p.581)

```
1706 {\xyuncatcodes \catcode'\#=6 %
1707 \gdef\next(#1,#2){+/#1 3pc/,p+/#2 3pc/}}
1708 \xylet@{\ar@curveinout@=\next
1710 \xydef@{\ar@curveinout{\expandafter\ar@curve@load\ar@curveinout@}}
```

To Do: implement this efficiently and properly get rid of the no- $()$ restriction!

3.3q. The final curve form is the most general one: `@'⟨control point lists⟩` sets the control points explicitly to the ones in the `⟨control point lists⟩` (where they should be separated by `,`). See the curve extension described in §2.1 for the way the control points are used; when the control points list is parsed p is the source and c the target of the arrow.

Curving simply uses `\crvi` instead of `\dir`. The only tricky bit is to put the control points on the stack right.

```

1734 \xydef@ar@curve{%
1735   \ifx \space@next \expandafter\DN@space{\xyFN@ar@curve}%gobble spaces
1736   \else\ifx \bgroup\next \let\next@=\ar@curve@load
1737   \else\ifx "\next \DN@"##1"{\ar@curve@{##1}}%
1738   \else \xyerror@{@= <form> must be followed by \string"<id>\string" or
1739         {<control point list>}}{}%
1740   \fi\fi\fi \next@}

1742 {\xyuncatcodes \gdef\next#1#2{\def#1##1{#2{;@={##1}}}}
1743 \next\ar@curve@load\ar@curve@

1745 \xydef@ar@curve@#1{\curve@check
1746   \setcurvearinit@{#1}\setcurvearexit@arexit@@
1747   \def\arstemprefix@{\crvi}\xyFN@ar@}

1749 {\xyuncatcodes \gdef\next#1{\save @,#1\restore}}
1750 \xylet@\setcurvearinit@i=\next
1751 \xydef@\setcurvearinit@#1{%
1752   \expandafter\addtoarinit@\expandafter{\setcurvearinit@i{#1}}}

1754 {\xyuncatcodes \gdef\next#1{\def#1{\POS @i @) }}}
1755 \xylet@\setcurvearexit@=\next

1757 \xydef@\curve@check{%
1758   \xyerror@{Forms @/.../, @(...), and @'...}, only available when curve
1759         extension loaded}}{}
1760 \xywithoption{curve}{\let\curve@check=\relax}

```

To Do: The parsing is trivial and should be extended to include more exotic control point forms.

3.3r. `@[...]` and `@*{...}` formations define what object `⟨modifier⟩`s should be used when building objects that are part of the arrow. This is mostly useful in conjunction with extensions that define additional `[(shape)]` modifiers, *e.g.*, if a `[red]` `⟨modifier⟩` changes the colour of an object to red then `@[red]` will make the entire arrow red; similarly if it is desired to make an entire arrow invisible then `@*{i}` can be used.

```

1779 \xydef@ar@modifiers#1{%
1780   \expandafter\def\expandafter\armodifiers@@\expandafter{\armodifiers@@#1}%
1781   \xyFN@ar@}

```

3.3s. `@<D>` will slide (each segment of) the arrow the dimension D as explained in note 3.3h.

```

1792 {\xyuncatcodes \catcode'\#=6 \catcode'\@=11 %
1793   \gdef\next<#1>{\def\arafterPOS@@{<#1>}\xyFN@ar@}}
1794 \xylet@\ar@slide=\next

```

3.3t. `@?` reverse the meaning of ‘above’ and ‘below’ for this particular arrow.

```

1805 \xydef@ar@upsidedown{\let\next=\PATHlabelabove@@

```

```
1806 \let\PATHlabelabove@@=\PATHlabelbelow@@ \let\PATHlabelbelow@@=\next}
```

All the features of $\langle\text{path}\rangle$ s described above are available for arrows.

End & log

3.4 Two-cell feature

Vers. 3.6 by Ross Moore <ross.moore@mq.edu.au>

This feature is designed to facilitate the typesetting of curved arrows, either singly or in pairs, together with labels on each part and between. The intended mathematical usage is for typesetting categorical “2-cell” morphisms and “pasting diagrams”, for which special features are provided. These features also allow attractive non-mathematical effects.

```

The 2-cell feature makes use of facilities from the ‘curve’ extension which is therefore automatically loaded.

```
48 \xyrequire{curve}\xycatcodes
```

3.4.1 Typesetting 2-cells in Diagrams

Categorical “2-cell” morphisms are used in the study of tensor categories and elsewhere. The morphisms are displayed as a pair of curved arrows, symmetrically placed, together with an orientation indicated by a short broad arrow, or *Arrow*. Labels may be placed on all three components.

```
63 \message{two-cells,}
```

Bug: This document still uses version 2-style commands, as described in appendix B.1.

```
\diagram
A\rtwoocell^f_g & B\
\enddiagram
```

```
\diagram
A\ruppertwoocell^f{\alpha}
\rlowertwoocell_h{\beta}
\erto_{.35}g & B\
\enddiagram
```

These categorical diagrams frequently have a matrix-like layout, as with commutative diagrams. To facilitate this there are control sequences of the form: `\rtwoocell`, `\ultwoocell`, `\xtwoocell`, ... analogous to the names defined in `xyv2` for use in diagrams produced using `xymatrix`. As this involves the definition of 21 new control sequences, many of which may never be used, these are not defined immediately upon loading `xy2cell`. Instead the user must first specify `\UseTwocells`.

As in the second example above, just the upper or lower curved arrow may be set using control sequences of the form `\..uppertwoocell` and `\..lowertwoocell`. These together with the `\..compositemap` family, in which two abutting arrows are set with an empty object at the join, allow for the construction of complicated “pasting diagrams” (see figure 3.3 for an example).

The following initialise the families of control sequences for use in matrix diagrams.

<code>\UseTwocells</code>	two curves
<code>\UseHalfTwocells</code>	one curve
<code>\UseCompositeMaps</code>	2 arrows, end-to-end
<code>\UseAllTwocells</code>	(all the above)

```

125 \xydef@UseTwocells{\definesupermorphism{twocell}{%
126 \xy@{start of 2-cell}{\begingroup}%
127 \twocell@}}
129 \xydef@UseHalfTwocells{%
130 \definesupermorphism{uppertwocell}{%
131 \xy@{start of 2-cell}{\begingroup}%
132 \uppertwocell@}%
133 \definesupermorphism{lowertwocell}{%
134 \xy@{start of 2-cell}{\begingroup}%
135 \lowertwocell@}}
137 \xydef@UseCompositeMaps{\definesupermorphism{compositemap}{%
138 \xy@{start composite-map}{\begingroup}%
139 \compositemap@}}
141 \xydef@UseAllTwocells{%
142 \UseTwocells \UseHalfTwocells \UseCompositeMaps }

```

The families of connections are defined using the utility macro...`\definesupermorphism` which defines control sequences for morphisms between neighbouring cells, and next-to-neighbouring cells.

More distant cells use `\xtwocell`, `\xcompositemap`, etc. with $\langle\text{hop}\rangle$ s e.g. `\xtwocell[1,3]` and `\xtwocell[1lddd]`.

```

```

Alternatively 2-cells can be set directly in \Xy -pictures without using the matrix feature. In this case the above commands are not needed. This is described in §3.4.6.

Furthermore a new directional $\text{\dir{=>}}$ can be used to place an “Arrow” anywhere in a picture, after the direction has been established appropriately. It is used with all of the 2-cell types.

```
204 \newdir{=>}{!/5pt/\dir{=}!/2.5pt/\dir{=}*/-5pt/\dir2{>}}

See below for the possible forms of `\twoocellPATH`.

Labels are placed labels on the upper and lower arrows, more correctly ‘anti-clockwise’ and ‘clockwise’, using `^` and `_`. These are entirely optional with the following token, or grouping, giving the contents of the label. When used with `\..compositemap` the `^` and `_` specify labels for the first and second arrows, respectively.

```

378 \Y@min=\the\Y@min \Y@max=\the\Y@max}\tmp@ }

```

Normally the label is balanced text, set in \TeX ’s math mode, with `\twoocellstyle` setting the style. The default definition is given by ...

```
\def\twoocellstyle{\scriptstyle}
```

This can be altered using `\def` in versions of \TeX or `\redefine` in \LaTeX . However labels are not restricted to being simply text boxes. Any effect obtainable using the \Xy -pic kernel language can be set within an `\xybox` and used as a label. Alternatively if the first character in the label is `*` then the label is set as an \Xy -pic `\object`, as if with `\drop<object>` or `*<object>` in the kernel language. The current direction is tangential to the curved arrows. Extra braces are needed to get a `*` as the label, as in `^{\{*\}}` or `_{\}*}`.

The position of a label normal to the tangential direction can also be altered by *nudging* (see below). Although it is possible to specify multiple labels, only the last usage of each of `^` and `_` is actually set, previous specifications being ignored.

Similarly a label for the central Arrow must be given, after the other labels, by enclosing it within braces `{...}`. An empty group `{}` gives an empty label; this is necessary to avoid misinterpretation of subsequent tokens. As above if the first character is `*` then the label is set as an \Xy -pic `\object`, the current direction being along the Arrow.

Parsing: Open a new group so the following registers can be used locally... `\toks@=\toks0, \toks1, ..., \toks8` the final parameter set is stored briefly in `\tmp@` before being used.

OPTIONS:

		spaces are ignored
<	<num>	determines position of curves control point
	<0>	uses a single solid line,
	<\omit>	causes only the central Arrow (with label) to be set
\omit		omits the curved arrows, but allows their labels
^		place “above” label (more correctly “anti-clockwise”)
_		place “below” label (more correctly “clockwise”)
~’		change the arrowhead
~‘		place/change the arrowtail

Label data e.g. $\hat{\#1} _{\#1}$ is stored temporarily in `\toks@` then passed via `\twocell@` to `\twocell@` for further parsing, as: `\the\toks@ @`

~’ and ~‘ change the values of `\twocellhead@` and `\twocelltail@` Normally `\twocelltail@` is {}, so ~‘ also changes a flag to indicate that `\twocelltail@` is indeed required.

When the next token is a grouping {...} then it gives the label for the central Arrow. No other label specifications may follow.

Default head and tail ornaments...

```

3.4.2 Standard Options

The orientation of the central Arrow may be reversed, turned into an equality, or omitted altogether. In each case a label may still be specified, so in effect the Arrow may be replaced by anything at all.

These effects are specified by the first token in the central label, which thus has the form: $\langle \text{tok} \rangle \langle \text{label} \rangle$ where $\langle \text{tok} \rangle$ may be one of ...

_	Arrow points clockwise
^	Arrow points anti-clockwise
=	no tip, denotes equality
\omit	no Arrow at all.

When none of these occurs then the default of _ is assumed. If the label itself starts with one of these characters then specify _ explicitly, or enclose the label within a group $\{ \dots \}$. See *Extra Options 1*, for more values of $\langle \text{tok} \rangle$. Also note that * has a special role when used as the first character; however it is considered to be part of the $\langle \text{label} \rangle$, see above.

OPTIONS for the central Arrow:

c l	ignore spaces
^	points anti-clockwise
_	points clockwise (default)
=	no \Tip, equality
\omit	no Arrow at all, just squine(s) or composed arrows
'	no Arrow, opposite squine reversed
'	no Arrow, forward squine reversed
"	no Arrow, tips on both ends
!	no Arrow, no tips on squines

the position of the Arrow is determined by “nudging” (see below) e.g. $\{ \wedge \langle \text{num} \rangle \text{label} \}$, where the actual dimen is $\langle \text{num} \rangle \backslash \text{xydashl} @$

```

Parsing of the Arrow's label

3.4.3 Nudging

Positions of all labels may be adjusted, as can the amount of curvature for the curved arrows. The way this is done is by specifying a “nudge” factor $\langle \text{num} \rangle$ at the beginning of the label. Here $\langle \text{num} \rangle$ is a number which specifies the actual position of the label in units of \xydashl@ (the length of a single dash, normally 5pt) except with \dotscompositemap , see below. Movement is constrained to the perpendicular bisector of the line \overline{cp} . When nudging the label for the central Arrow it is the whole Arrow which is moved, along with its label.

Curvature of the arrows themselves is altered by a nudge of the form $\text{\dots twocell}\langle \text{num} \rangle \dots$. The separation of the arrows, along the bisector, is set to be $\langle \text{num} \rangle \text{\xydashl@}$. When $\langle \text{num} \rangle$ is zero, that is $\text{\dots twocell}\langle 0 \rangle \dots$, the result is a single straight arrow, its mid-point being the origin for nudging labels. A negative value for $\langle \text{num} \rangle$ is also acceptable; but check the orientation on the Arrow and which of \wedge and $_$ correspond to which component.

The origin for nudging labels is where the arrow crosses the bisector. Positive nudges move the label outwards while negative nudges move towards \overline{pc} and possibly beyond. The default position of a label is on the outside, with edge at the origin.

The origin for nudging the Arrow is at the midpoint of \overline{pc} . A positive nudge moves in the clockwise direction. This will be the direction of the arrowhead, unless it has been reversed using $\hat{\cdot}$.

Labels on a $\backslash\cdot\cdot\text{compositemap}$ are placed relative to the midpoint of the component arrows. Nudges are in units of 1pt. Movement is in the usual Xy-pic *above* and *below* directions, such that a positive nudge is always outside the triangle formed by the arrows and line \overline{pc} .

The special nudge value $\langle\backslash\text{omit}\rangle$ typesets just the Arrow, omitting the curved arrows entirely. When used with labels, the nudge value $\langle\backslash\text{omit}\rangle$ causes the following label to be ignored.

Exercise 3.7: Give code to typeset figure 3.3.

Such code is relatively straight-forward, using “nudging” and $\backslash\text{omit}$ to help position the arrows, curves and Arrows. It also uses an *excursion*, as described below in the subsection *Extra Options 3*.

(p.582)

NUDGE position of labels

```

```

3.4.4 Extra Options

The following features are useful in non-mathematical applications.

1. no Arrow

This is determined by special values for $\langle\text{tok}\rangle$ as the first (or only) character in the central label, as in the above description of the standard switches.

- ' arrowheads pointing clockwise;
- ' arrowheads pointing anti-clockwise;
- " arrow tips on both ends;
- ! no tips at all.

The central Arrow is omitted, leaving symmetrically placed curved connections with arrowheads at the specified ends. A label can be placed where the Arrow would have been.

If a special arrowhead is specified using `~' { . . }` (see Extra Options 2, below) then this will be used instead of the standard `\dir{>}`.

```
\xymatrixcolsep{5pc}

^{\hbox{\tiny theory }}{"}
&\relax\txt{Physics} \!
\enddiagram
```

2. Changing Tips and Module Maps

The following commands are provided for specifying the `<object>` to be used when typesetting various parts of the twocells.

<i>command</i>	<i>default</i>
<code>\modmapobject{⟨object⟩}</code>	<code>\dir{}</code>
<code>\twoocellhead{⟨object⟩}</code>	<code>\dir{>}</code>
<code>\twoocelltail{⟨object⟩}</code>	<code>\dir{}</code>
<code>\arrowobject{⟨object⟩}</code>	<code>\dir{=>}</code>
<code>\curveobject{⟨object⟩}</code>	
<code>\uppercurveobject{⟨object⟩}</code>	<code>{}</code>
<code>\lowercurveobject{⟨object⟩}</code>	<code>{}</code>

These commands set the object to be used for all subsequent 2-cells at the same level of \TeX grouping. `\curveobject` specifies both of the upper- and lower-curve objects. For some of these there is also a way to change the object for the current 2-cell only. This requires a `~⟨switch⟩` which is described below, except for the `\..curveobject` types, which are discussed in *Extra Options 4*.

These effects are specified by placing switches after the `\..twoocell` control sequence, e.g. `\rtwoocell switches labels...`. Each switch is either a single token `⟨tok⟩`, or a `~⟨tok⟩` with a single argument: `~⟨tok⟩{arg}`. Possibilities are listed in the following table, in which `{..}` denotes the need for an argument.

<code>\omit</code>	no arrows, Arrow and label only;
<code>!</code>	place module-map indicator;
<code>~'⟨..⟩</code>	change arrow-head to <code>{..}</code> ;
<code>~'⟨..⟩</code>	place/change tail on arrow(s);
<code>~{..}</code>	change object used to set curves;
<code>~^⟨..⟩</code>	use object <code>{..}</code> to set upper curve;
<code>~_⟨..⟩</code>	use object <code>{..}</code> to set lower curve;

Here we discuss the use of `!`, `~'`, `~'` and `\omit`. The description of `~^`, `~_` and `~{..}` is given in *Extra Options 4*.

The default module map indicator places a single dash crossing the arrow at right-angles, located roughly midway along the actual printed portion of the arrow, whether curved or straight. This takes into account the sizes of the objects being connected, thereby giving an aesthetic result when these sizes differ markedly. This also works with `\..compositemap` where an indicator is placed on each arrow. The actual object can be changed using `\modmapobject`.

Any of the standard $\Xy-pic$ tips may be used for arrow-heads. This is done using `~'⟨..⟩`, for example `~'\dir{>>}` gives double-headed arrows. Similarly `~'⟨..⟩` can be used to place an arrow-tail. Normally the arrow-tail is `,` so is not placed; but if a non-empty tail has been specified then it will be placed, using `\drop`. No guarantee is offered for the desired result being obtained when an arrow-tail is mixed with the features of *Extra Options 1*.

```

3. Excursions

Syntax for `\xcompositemap` and `\x..twoocell` types is a little different to what might be expected from that for `\xto`, `\xline`, etc. For example,

```
\xtwoocell[⟨hop⟩]{⟨displace⟩}...
```

connects to the `⟨pos⟩` displaced by `⟨displace⟩` from the relative cell location specified by `⟨hop⟩`. The displacement can be any string of valid $\text{\X}\text{\Y}$ -pic commands, but they must be enclosed within a group `{...}`. When the cell location is the target, a null grouping `{}` *must* be given.

When used with the `<\omit>` nudge, such excursions allow a labelled Arrow to be placed anywhere within an $\text{\X}\text{\Y}$ -pic diagram; furthermore the Arrow can be oriented to point in any direction.

```
1086 \xydef@\curveobject#1{\def\ucurveObject@{~*#1}\def\dcurveObject@{~*#1}}
1087 \xydef@\uppercurveobject#1{\def\ucurveObject@{~*#1}}
1088 \xydef@\lowercurveobject#1{\def\dcurveObject@{~*#1}}
1089 \xydef@\ucurveObject@{}
1090 \xydef@\dcurveObject@{}
```

The empty object gives the default of closely spaced tiny dots, resulting in a “smooth” curve.

The following macro is used in conjunction with compiling diagrams, to include the global parameters in the compiled file.

```
1102 \xydef@\savetwoocellobjects{%
1103 \xy@{twoocell objects}{%
1104 \expandafter\uppercurveobject\expandafter{\ucurveObject@}%
1105 \expandafter\lowercurveobject\expandafter{\dcurveObject@}%
1106 \expandafter\modmapobject\expandafter{\modmapobject@}%
1107 \expandafter\twoocellhead\expandafter{\twoocellhead@}%
1108 \expandafter\twoocelltail\expandafter{\twoocelltail@}%
1109 \expandafter\arrowobject\expandafter{Arrowobject@}%
1110 }}
```

4. Fancy curves

By specifying `\curveobject` an arbitrary object may be used to construct the curved arrows. Indeed with a `\..twoocell` different objects can be used with the upper and lower curves by specifying `\uppercurveobject` and `\lowercurveobject`.

These specifications apply to all 2-cells subsequently constructed at the same level of \TeX grouping. Alternatively using a `~`-switch, as in *Extra Options 2*, allows such a specification for a single 2-cell or curved part.

Objects used to construct curves can be of two types. Either a single `⟨object⟩` is set once, with copies placed along the curve. Alternatively a directional object can be aligned with the tangent along the curve. In this case use a specification takes the form:

```
\curveobject{⟨spacer⟩~**⟨object⟩}.
```

Here `⟨spacer⟩` may be any `⟨object⟩` of non-zero size. Typically it is empty space, *e.g.* `+⟨dimen⟩{}`.

Exercise 3.8: Give code to typeset the following diagrams.

(p.582)

3.4.5 After Parsing...

Values for `\twocellPATH`, depends on the mode of picture/diagram as to whether the `@c` and `@p` are known yet, or still have to be read.

\def\myPOS#1{\POS}\def\goVia#1{%
  \afterPOS{\connect#1\myPOS}}
\xy
*+{A}="A", +<1cm, 1.5cm>*+{B}="B",
+<2.0cm, 0pt>*+{C}="C",

```

```
+<1cm,-1.5cm>*+{D}="D",
"A";\goVia{\uppertwoocell^{\alpha{}}}"B"{
};\goVia{\twoocell^{\zeta_{\xi{\gamma}}}}"C"{
};\goVia{\compositemap{}}"D"{,
"A";\goVia{\lowertwoocell{}}"D"{
\endxy
```

The code shown is a compact way to place a chain of 2-cells within a picture. It illustrates a standard technique for using `\afterPOS` to find a `<pos>` to be used for part of a picture, then subsequently reuse it. Also it is possible to use `\drop` or `<decor>`s to specify the 2-cells, giving the same picture.

```
\xy *+{A}="A",+<1cm,1.5cm>*+{B}="B",
+<2cm,0pt>*+{C}="C",
+<1cm,-1.5cm>*+{D}="D",
"A";"B",{ \uppertwoocell^{\alpha{}}},
"B";"C",{ \twoocell^{\zeta_{\xi{\gamma}}}},
"C"; \afterPOS{\drop\compositemap{}}"D"
\POS "A";
\afterPOS{\drop\lowertwoocell{}}"D"
\endxy
```

The `\connect` variant is usually preferable as this maintains the size of the object at `c`, while the `\drop` variant leaves a rectangular object having `p` and `c` on opposite sides.

This is used outside of diagrams.

```

`\twoocell@@` is the main switching engine, taking 9 parameters determining which pieces to set and where to position them. This includes curvature of the squines, whether to draw two squines or only one, or to use straight lines, whether to have a central Arrow and its orientation, contents of labels and their positions.

The current `p` and `c` are the extents of the connection these are stored as `"p"` and `"c"` for repeated use;

- #1 determines location of control point " m "
- #2 location of \Rightarrow , as multiple of $\backslash\xydashl@$ from " m "
- #3 location of $_$ label (source arrow)
- #4 location of $\hat{}$ label (target arrow)
- #5 flag for how many squines to draw & which tips
- #6 label for source arrow
- #7 label for target arrow
- #8 label for \Rightarrow (2-cell morphism)
- #9 determines orientation of 2-cell

The following tokens may appear as parameters in #9: $!$, $\hat{}$, $_$, $=$, A , V , H

3.5 Matrix feature

Vers. 3.9 by Kristoffer H. Rose <krisrose@tug.org>

This option implements “ Xy -matrices”, *i.e.*, matrices where it is possible to refer to the entry objects by their row/column address. We first describe the general form of Xy -matrices in §3.5.1, then in §3.5.2 we summarise the new $\langle\text{coord}\rangle$ inate forms used to refer to entries. In §3.5.3 we explain what parameters can be set to change the spacing and orientation of the matrix, and in §3.5.4 we explain how the appearance of the entries can be changed.

```

3.5.1 Xy -matrices

The fundamental command of this feature is

$$\backslash\text{xymatrix} \langle\text{setup}\rangle \{ \langle\text{rows}\rangle \}$$

that reads a matrix of entries in the generic $\text{T}_{\text{E}}\text{X}$ row&column format, *i.e.*, where rows are separated with $\backslash\backslash$ and contain columns separated with $\&$ (we discuss in the following sections what $\langle\text{setup}\rangle$ can

be). Thus a matrix with $maxrow$ rows and $maxcol$ columns where each entry contains row,col is entered as

```
\xymatrix{
  1,1 & 1,2 & \cdots & 1,maxcol \\
  2,1 & 2,2 & & 2,maxcol \\
  \vdots & & \ddots & \\
  maxrow,1 & maxrow,2 & & maxrow,maxcol }
```

(TeXnically the & character represents any ‘alignment tab’, *i.e.*, character with category code 4).

A $\langle matrix \rangle$ can appear either in an $\langle XY \rangle$ -picture (as $\langle decor \rangle$) or “stand-alone”.

The aspects in which \xymatrix differs from ordinary matrix constructions, such as Plain TeX’s $\matrix\{\dots\}$ and L^ATeX’s \array environment, are

- arbitrary $\langle XY \rangle$ -pic $\langle decor \rangle$ ations may be specified in each entry and will be interpreted in a state where c is the current entry,
- the entire matrix is an object itself with reference point as the top left entry, and
- a progress message “ $\langle xymatrix rows \times cols size \rangle$ ” is printed for each matrix with $rows \times cols$ entries and $\langle XY \rangle$ -pic complexity $size$ (the number of primitive operations performed), unless the declaration $\text{\texttt{SilentMatrices}}$ is issued.
- Entries starting with a * are special (described in §3.5.4)², so use $\{*\}$ to get a *.

For example,

```
\xy
\xymatrix{A&B\|C&D}
\drop\frm{-}
\drop\cir<8pt>{ }
\endxy
```

will typeset

Bug: Matrix nesting is not safe.

Matrices are often quite slow to typeset so as a convenience all matrices can be set to compile (and not) automatically with the declarations

```
\CompileMatrices
\NoCompileMatrices
```

Matrices can be compiled or not individually, by using the explicit commands \xymatrixcompile and \xymatrixnocompile as well as by encapsulating in the usual $\xycompileto\langle name \rangle\{\dots\}$ (see note 1.5e).

Note: Matrices will only compile correctly if all entries start with a nonexpandable token, *i.e.*, $\{$ or \relax or some non-active character.

²In general it is recommended that entries start with a non-expanding token, *i.e.*, an ordinary (non-active) character, $\{$, or \relax , for compilation to work.

On the following code: The complexity of this option stems from the fact that we cannot build the actual Xy-picture until after the matrix has been typeset so that we know the sizes and places of all the entries. The handling described here is thus separated into several subprocedures.

Setup: Not much—only to keep track of the rows and columns. These are not accesible to the user—should they?

```

157 \xynew@{count}\Row
158 \xynew@{count}\Col

160 \xydef@{maxrow@}{0}           % highest row number used
161 \xydef@{maxcol@}{0}         % highest column number used
162 \xydef@{maxcolrow@}{0}      % a row with maximal number of columns

```

There are some user-defined parameters summarised later.

The following is an experimental set of ‘optimal’ queueing macros using two queues and two counters to keep track of the progress.

```

171 \xynew@{toks}\queue@
172 \xynew@{toks}\queue@@

174 \xynew@{count}\qcount@
175 \xynew@{count}\qcount@@

177 \xydef@{clearq@}{%
178   \global\queue@={}\global\qcount@=\@ne
179   \global\queue@@={}\global\qcount@@=\z@}

181 \xydef@{addq@#1}{\global\advance\matrixsize@\@ne
182   \ifnum\qcount@@<\qcount@ \let\addq@@=\addq@i
183   \else \let\addq@@=\addq@ii \fi
184   \expandafter\addq@@\the\queue@@\addq@@{#1}}

186 \xylet@{addq@@}=\relax

188 \xydef@{addq@i#1\addq@@#2}{%
189   \global\advance\qcount@@\@ne \global\queue@@={#1#2}}

191 \xydef@{addq@ii#1\addq@@#2}{%
192   \global\advance\qcount@\@ne \global\qcount@@=\z@
193   \global\queue@=\expandafter{\the\queue@#1#2}\global\queue@@={}}

195 \xydef@{finishq@}{\expandafter\addq@ii\the\queue@@\addq@@{}}

```

Hack: intended to make the addition of tokens to the token list faster: we first add to the ‘small’ `\queue@@` as many times as we have added to the ‘big’ `\queue@` before that. So we know we should always expand `\queue@@`: this is done first (last in the macro text). Then we call `\addq@@` that will either add to the small one or add the small one to the big one and then clear the small one!

Usage: Call `\clearq@` first. Then use `\addq@` as many times as desired. To get the queue in `\queue@` call `\finishq@` and use it. Finally clear `\queue@` (globally) or continue.

Main procedure: Here is the main code which is concerned with initialisations and output of messages explaining how far the matrix construction has progressed.

```

To Do: Proper nesting that ensures that the matrix state is reestablished after the current one has been typeset.

Each subprocedure is explained below.

Set row-rotation: This sets the general direction of the rows as the current direction indicates. This direction is not known until \mathbb{X} -time so it gets put into the row/column definitions.

```

Pretypeset: The purpose of this is to

- set `box8` to an `halign` with all the entries properly typeset to be measured in the next step, and
- store in a queue the operations that will define each entry as an object once the measurement is done and the distances between rows and columns is known.

This is achieved as follows: Row/column counters, maxima, and queues are reset. The `tab-` and `interlineskip` is removed to make taking the constructed box apart easier. And the `halign` template is used to apply an appropriate action for each entry that updates the counters and queue.

The special `\xymatrixsavedCOORD@` is used to store the original `\COORD@` except when diagrams are nested.

```

344 \xylet@\xymatrixsavedCOORD@=\relax
346 \xydef@\xymatrix@pretypeset#1{
347 \global\Row=\z@ \xdef\maxcol@{0}\clearq@
348 \setbox8=\vtop{

```

```

349 \ifx\xymatrixsavedCOORD@\relax \let\xymatrixsavedCOORD@=\COORD@ \fi
350 \let\COORD@=\xymatrixCOORD@
351 \everycr{}\let\=\cr \tabskip=\z@ \offinterlineskip
352 \halign{\preentry@ ##!\&&\xyFN@\preentry@##!\cr#\cr}\cr}%
353 \preentry@@@}%
354 \xdef\maxrow@{\the\Row}%
355 \finishq@}

```

The first entry in each row is special; in particular it moves the entries from the columns of the previous row (if any) into the second-level queue:

```

363 \xydef@\preentry@{\relax
364 \ifnum\Row>\z@
365 \ifnum\maxcol@<\Col\xdef\maxcol@{\the\Col}\xdef\maxcolrow@{\the\Row}\fi
366 \expandafter\xdef\csname maxcol@the\Row\endcsname{\the\Col}\fi
367 \global\advance\Row\@ne \global\Col=\z@ \xyFN@\preentry@@}

```

The common part should first typeset the object. Then the resulting \langle setup \rangle commands should be emitted as described below.

While typesetting the entry, \mathbb{X} -commands are *disabled* by redefining $\backslash xy@$ to just ‘eat’ its arguments, so they don’t interfere. . .

```

378 \xylet@\lastpreentry@@=\relax
380 \xydef@\xyeatall@{\let\xy@=\xyeat@ \change@oxy@\xyeat@ \let\xy@@ix@=\eat@}
382 \xydef@\preentry@@{\global\advance\Col\@ne

Bug: It should be possible to change the adjustment more profoundly for individual entries, rows, and columns.

Measure: Take the created box8 apart to define the macros `\Wcol@col` and `\Hrow@row` containing the width and height of the bounding box of the entries in the row/column. Finally the commands collected in the queue are executed (hopefully they'll invoke `\pre@emit` a number of times). This is a hook because some special cases won't need it...

To Do: Allow non-default spacing between particular rows/columns as well as different justification of the entire matrix...

Typeset: Retypeset the entire diagram using a hacked `halign`: its template typesets each entry as

$$\backslash\text{POS "row , col" * object \relax X\textit{y}-commands\relax}$$

where *object* is the contents of the entry translated into `X\textit{y}-pic` (object) form and *X\textit{y}-commands* entails the commands used in this particular entry.

```

584 \xydef@xymatrix@typeset#1{%
585   \clearq@
586   \hbox{\vtop{\xyqall@
587     \xy@@{\ifx\yMATRIXsAVEDCOORD@\relax

596     \xy@@{\leave@}}}%
597   \finishq@ \expandafter\xy@@\expandafter{\the\queue@}\global\queue@={}}

```

Here are the template execution macros: We reset the `\queue@` for each entry, `\drop` it the usual way except first all `Xy`-commands are ‘redirected’ to the queue, and then typeset them.

```
605 \xydef@{\entry@{\relax \global\advance\Row\@ne \global\Col=\z@ \entry@@}}
```

Again some parsing determines whether this is a `*`-object or a normal object:

```
612 \xydef@{\entry@@{\global\advance\Col\@ne
613 \DN@##1,##2,##3@{\xy@{ENTRY "##3##1,##2"}{\Row=##1 \Col=##2\relax
614 \cfromid@{##3##1,##2}\pfromc}}}%
615 \edef\nextii@{\the\Row,\the\Col,\xymatrixprefix@@ @}%
616 \expandafter\next@\nextii@
617 \xyFN@\entry@@i}

619 \xydef@{\entry@@i{\let\next@=\entry@@norm
620 \ifoldxymatrix@else \ifx *\next \DN@*{\xyFN@\entry@@star}\fi \fi
621 \next@}

623 \xydef@{\entry@@star{\ifx *\next \DN@*{\xyFN@\entry@@star@ii}%
624 \else \DN@##1##{\entry@@star@i{##1}}\fi \next@}

626 \xydef@{\entry@@star@i#1#2#3!@{%
627 \xy@@ix@{##1}{##2}\xy@@{\expandafter\dropentry@\the\toks9}%
628 \setboxz@h{\xyqall@
629 \ifx\xymatrixsavedCOORD@\relax \let\xymatrixsavedCOORD@=\COORD@ \fi
630 \let\COORD@=\xymatrixCOORD@ \everyentry@ #3}%
631 \setbox\z@=\copy\voidb@x}

633 \xydef@{\entry@@star@ii{%
634 \ifx [\next
635 \DN@{##1}{\DN@####1{\def\entrymodifiers@{##1}####1}}}%
636 \expandafter\next@\expandafter{\entrymodifiers@}\entry@@norm}%]
637 \else
638 \DN@##1{\DN@####1{\def\entrymodifiers@{##1}####1}}}%
639 \expandafter\next@\expandafter{\entrymodifiers@}\entry@@norm}%
640 \fi \next@}

642 \xydef@{\entry@@norm#1!@{%
643 \DN@##1{\expandafter\xy@@ix@
644 \expandafter{\expandafter{\entrymodifiers@}{##1}}}%
645 \expandafter\next@\expandafter{\everyentry@#1}%
646 \xy@@{\expandafter\dropentry@\the\toks9}%
647 \setbox\z@=\expandafter\object\entrymodifiers@{\xyqall@
648 \ifx\xymatrixsavedCOORD@\relax \let\xymatrixsavedCOORD@=\COORD@ \fi
649 \let\COORD@=\xymatrixCOORD@ \everyentry@ #1}%
650 \setbox\z@=\copy\voidb@x}
```

Dropping the entry is just retypesetting it at the right location again ignoring the `Xy`-stuff:

```
657 \xydef@{\dropentry@#1#2{\drop@{##1}{\xyeatall@
658 \ifx\xymatrixsavedCOORD@\relax \let\xymatrixsavedCOORD@=\COORD@ \fi
659 \let\COORD@=\xymatrixCOORD@ #2}}
```

The macros used for queuing are these; only the `toks9` replacement is tricky; furthermore queuing is *not* done if we are saving because the effect will give the same result without risk of extremely long lines in the compiled file!

```

668 \xydef@\xyqall@{%
669 \ifxysaving@ \let\xy@=\xyqs@ \let\xy@@ix@=\xysave@@toksix@
670 \else \let\xy@=\xyq@ \let\xy@@ix@=\xyq@@toksix@ \fi

```

Insert: Finally we insert the matrix in the $\text{X}\bar{\text{Y}}$ -picture logically by ensuring that it has the right size

```

691 \xydef@\xymatrix@insert{%
692 \xy@@{\edef\nextii@{\xy@minX@@}{\xy@maxX@@}{\xy@minY@@}{\xy@maxY@@}}%
693 \expandafter\xymatrix@insert@\nextii@}
695 \xydef@\xymatrix@insert@#1#2#3#4{\matrixorigin@
696 \L@c+=\X@c \advance\L@c-#1\relax
697 \R@c=-\X@c \advance\R@c+#2\relax
698 \D@c+=\Y@c \advance\D@c-#3\relax
699 \U@c=-\Y@c \advance\U@c+#4\relax
700 \Edge@c={\rectangleEdge}}
    
```

To Do: Should handle other forms than reference point at center of "1,1" as hardcoded here. In particular reference point at baseline of "1,1" would be useful...

3.5.2 New coordinate formats

It is possible within entries to refer to all the entries of the $\text{X}\bar{\text{Y}}$ -matrix using the following special $\langle\text{coord}\rangle$ inate forms:

$"r, c"$	Position and extents of entry in row r , column c (top left is "1,1")
$[\Delta r, \Delta c]$	Δr rows below, Δc columns right of current entry
$[\langle\text{hop}\rangle^*]$	entry reached by $\langle\text{hop}\rangle$ s; each $\langle\text{hop}\rangle$ is one of dulr describing one 'move' to a neighbor entry
$[\langle\text{hop}\rangle^+ \langle\text{place}\rangle]$	$\langle\text{place}\rangle$ on straight line to <i>non-empty</i> $[\langle\text{hop}\rangle^*]$

So the current entry has the synonyms $[0,0]$, $[\]$, $[\text{r}1]$, $[\text{ud}]$, $[\text{dudu}]$, etc., as well as its 'absolute' name $"r, c"$.

These forms are useful for defining diagrams where the entries are related, e.g.,

was typeset by

$\text{\$}\text{\$}\text{\xy}$

```
\xymatrix{
  A \POS[];[d]**\dir{~},
      [];[dr]**\dir{-}  \\
  B & C \POS[];[l]**\dir{.} }
\endxy$$
```

If an entry outside the XY -matrix is referenced then an error is reported.

In case several matrices are used in the same diagram, and they refer to each other, then it is useful to give the matrices different " $\langle\text{prefix}\rangle$ " $\langle\text{setup}\rangle$ such that they can refer to each other using the following special coordinate forms that all have the same meaning except the target entry is picked from a particular matrix:

```
"\langle\text{prefix}\rangle r,c"
["\langle\text{prefix}\rangle" \Delta r,\Delta c]
["\langle\text{prefix}\rangle" \langle\text{hop}\rangle* ]
["\langle\text{prefix}\rangle" \langle\text{hop}\rangle^+ \langle\text{place}\rangle ]
```

In fact absolute references *must* always be given using " $\langle\text{prefix}\rangle\langle\text{row}\rangle,\langle\text{col}\rangle$ ", *even inside the matrix itself*.

Here is an example using this:

was typeset (using the 'frame' extension and 'arrow' feature) by

```
\xy
\xymatrix"*"%
  A & B \\
  C & D }%
\POS*\frm{--}
\POS-(10,3)
\xymatrix{%
  A' \ar@{.}[*"] & B' \ar@{.}[*"] \\
  C' \ar@{.}[*"] & D' \ar@{.}[*"] }%
\POS*\frm{--}
\endxy
```

These handle the parsing and interpretation of bracketed $\langle\text{coord}\rangle$ inates; the number is computed already at parse time:

```

```

3.5.3 Spacing and rotation

Any matrix can have its spacing and orientation changed by adding `\setup` ‘switches’ between `\xymatrix` and the opening `{`.

The default spacing between entries of matrix is changed with the switches

```
@R<add op> <dimen>
@C<add op> <dimen>
@ <add op> <dimen>
```

that change row spacing, column spacing, and both, respectively, as indicated by the `<add op>` and `<dimen>`, where the `<dimen>` may be omitted and can be given as one of `R` and `C` to indicate the current value of the parameter in question. **Note:** there is *no default*.

In addition, `Xy-pic` can be instructed to use a ‘fixed grid’ for the matrix with the switches

```
@!R
@!C
@!
```

that ensure that the row spacing, column spacing, and both, respectively, pretending that *all* entries have the size of the largest entry (without modifying the real size of the entries, of course, only the spacing – to get the entries to *really* have the same size use a `@*... \setup` described in §3.5.4 below). The special variants

```
@!O
@!=<dimen>
```

pretend that entries have zero or `<dimen>` height and width for computing row and column spacing; as above inserting `R` or `C` just after the `!` makes this affect only the row *or* column spacing, *e.g.*, `@!RO` means that the row spacing only is between the centers of the rows.

Finally, the spacing of things that are typeset can be adjusted separately:

```
@M<add op> <dimen>
@W<add op> <dimen>
@H<add op> <dimen>
@L<add op> <dimen>
```

will adjust the entry margin, entry width, entry height, and label separation used (the latter is actually passed to the arrow feature).

```

```

1015 \xydef@xymatrixrowsep{\afterADDOP{\Addop@@xymatrixrowsep@}}
1016 \xydef@xymatrixcolsep{\afterADDOP{\Addop@@xymatrixcolsep@}}

```

To Do: optimize processing of matrices with constant grid.

An entire matrix can be rotated by adding a rotation $\langle\text{setup}\rangle$ of the form

$$\@(\text{direction})$$

This will set the orientation of the rows to $\langle\text{direction}\rangle$ (the default corresponds to \mathbf{r} , *i.e.*, rows are oriented left to right).

The code is the first procedure of the main matrix code above (1.304); factors are used by $\backslash\text{pre@emit}$.

3.5.4 Entries

The appearance of a single entry can be modified by entering it as

$$* \langle\text{object}\rangle \langle\text{pos}\rangle \langle\text{decor}\rangle$$

This makes the particular entry ignore the entry modifiers and typeset as a kernel object with the same reference point as the (center of) the default object would have had.

Additional object $\langle\text{modifier}\rangle$ s may be added to an otherwise ordinary entry by using the forms

$$\begin{aligned} & **[\langle\text{shape}\rangle] \langle\text{entry}\rangle \\ & **\{\langle\text{modifier}\rangle^*\} \langle\text{entry}\rangle \end{aligned}$$

The first sets the default $\langle\text{shape}\rangle$ for objects (*cf.* note 1.4j), the second a default size (change, *cf.* note 1.4g), and the last makes it possible to add any $\langle\text{object}\rangle$ modifier of §1.4, *e.g.*, for recentering entries after the default entry form which is equivalent to ‘! $\mathbf{C} + \langle 2 \times \text{objectmargin} \rangle$ ’ (with the effect of centering the object and add the *objectmargin*) to all sides.

Exercise 3.9: Typeset the following diagram:

$$\begin{array}{ccc} A \times B & \xrightarrow{/A} & B \\ /B \downarrow & & \downarrow \times A \\ A & \xrightarrow[B \times]{} & B \times A \end{array}$$

(p.583)

It is also possible to use these $\@(\text{setup})$ s (as usual between $\backslash\text{xymatrix}$ and the leading $\{$):

$$\begin{aligned} & \@*[\langle\text{shape}\rangle] \\ & \@* \langle\text{add op}\rangle \langle\text{size}\rangle \end{aligned}$$

which are equivalent to changing all entries to behave as if they had started with the similar $**$ -form.

To Do: Allow $**\langle\text{add op}\rangle\langle\text{size}\rangle \langle\text{entry}\rangle$ for entries.

If the default set of entry modifiers should be changed then the following declaration must be issued before the $\backslash\text{xymatrix}$ command; this is the only way to actually switch the initial default centering and spacing off:

$$\backslash\text{entrymodifiers}=\{ \langle\text{modifier}\rangle^* \}$$

Be warned, however, that changing the entry modifiers in this way cancels any spacing setup commands discussed in §3.5.3 above – indeed the default modifiers combine two things: (1) align entry as if given the modifiers +!A, and (2) ensure that the entry has at least the size requested by any spacing setup.

Note: this was changed for version 3.8 following the analysis of Alex Perlis [11]. The default entry modifiers can be reestablished with

```
\entrymodifiers={!\entrybox}
```

Exercise 3.10: How did the author typeset the following matrix?

(p.583)

Bug: The four constructions @*[...], **[...], @* <add op> <size>, and **{...}, *accumulate in reverse order*. Only entries starting with a single * completely override the modifiers <setup> with a @*-construction.

```

1227 %%New code:
1228 %
1229 % Horizontal: A will be desired width, Rp is "right offset" (from left edge).
1230 \A@=\wdz@ \R@p=\z@
1231 % Make sure width is at least @W (and then shift actual box by half).
1232 \dimen@=\objectwidth@ \advance\dimen@-\A@
1233 \ifdim\dimen@>\z@ \advance\A@\dimen@ \R@p=.5\dimen@ \fi
1234 % Add @M margin.
1235 \dimen@=\objectmargin@ \advance\A@2\dimen@ \advance\R@p\dimen@
1236 % Vertical: B will be desired height+depth, Up is "up offset" (from baseline).
1237 \B@=\ht\z@ \advance\B@\dp\z@ \U@p=-\fontdimen22\textfont\tw@
1238 % Make sure height is at least @H.
1239 \dimen@=\objectheight@ \advance\dimen@-\B@
1240 \ifdim\dimen@>\z@ \advance\B@\dimen@ \fi
1241 % Add @M margin.
1242 \dimen@=\objectmargin@ \advance\B@2\dimen@
1243 % Build the adjusted box.
1244 \setboxz@h{\kern\R@p \raise\U@p\boxz@}%
1245 % Fix the box width.

```

```

1246 \wdz@=\A@
1247 % Fix the box height and depth.
1248 \advance\B@-\ht\z@ \advance\B@-\dp\z@ \B@=.5\B@
1249 \dimen@=\ht\z@ \advance\dimen@\B@ \ht\z@=\dimen@
1250 \dimen@=\dp\z@ \advance\dimen@\B@ \dp\z@=\dimen@
1251 \boxz@}
    
```

The `\entrybox` code computes the following: the box is horizontally centered
 Finally, `@1` is short for `@M=1pt`, *i.e.*, setting the object margin to 1pt.

The individual entries can also be augmented using the following declaration, which will setup `<decor>` that should be inserted before everything else in each entry. Initially it is empty but

```
\everyentry={ <decor> }
```

will insert `<decor>` first in each entry; inside the counter registers `\Row` and `\Col` are set to the current entry's row and column, respectively. For example,

```

\everyentry={{\the\Row,\the\Col}}
\xymatrix @*[F]*@[o] {
  {} \POS[];[r]**\dir{.} & \ \\
  {} \POS[];[ur]**\dir{--}
}
    
```

will typeset

```

1288 \xywarnifdefined\everyentry
1289 \xypandafter\def\addEQ@\everyentry#1{\def\everyentry@{#1}\ignorespaces}
1291 \xylet@\everyentry@=\empty
    
```

Note: When using compilation, changes to `\everyentry` and `\entrymodifiers` will *not* result in recompilation even when the constructed matrix changes – you may have to remove the `.xyc` file manually.

Exercise 3.11: How did the author typeset the following diagram?

Hints: The arrow feature was used to make the bending arrows and the frame extension for the frames around each cell. (p.583)

End & log

```

1336 \xyendinput

3.6 Graph feature

Vers. 3.10 by Kristoffer H. Rose <krisrose@tug.org>

This option implements ‘Xy-graph’, a special *combinatoric drawing language* suitable for diagrams like flow charts, directed graphs, and various forms of trees. The base of the language is reminiscent of the PIC [5] language because it uses a notion of the ‘current location’ and is based on ‘moves’. But the central construction is a ‘map’ combinator that is borrowed from functional programming.

```

Xy-graph makes use of facilities of the ‘arrow’ feature option of §3.3, which is therefore required.

```
48 \xyrequire{arrow}\xycatcodes
```

Figure 3.5 summarises the syntax of a <graph> with notes below. A <graph> can appear either in an Xy-picture (as <decor>) or “stand-alone”.³ **Note:** If you use <xygraph{...}> inside constructions

³In fact L^AT_EX users can use a `graph` environment.

where & is significant (like plain T_EX's `\halign` or L^AT_EX's `array` environment) then make sure to add an extra level of braces around it.

Parsing: The parser does almost everything that this feature does because it is all implemented directly on top of other constructions, notably the kernel stack and the `<arrow>` construction.

The graph state always has the current value of ? both as the stacktop and in the special `<id>` "`?NODE`".

```

Notes

3.6a. A *move* is to establish a new *current node*.

3.6b. To *draw* something is simply to draw a line or the specified $\langle \text{arrow} \rangle$ from the current node to the specified target node. The target then becomes the current node. All the features of arrows as described in §3.3 can be used, in particular arrows can be labelled and segmented, but with the change that $\langle \text{path-pos} \rangle$ means $\langle \text{node} \rangle$ as explained in note §3.3e.

3.6c. To *map over a list* is simply to save the current node and then interpret the $\langle \text{list} \rangle$ with the following convention:

- Start each element of the list with the current node as saved and p as the previous list element, and
- let the ? $\langle \text{node} \rangle$ refer to the saved current node explicitly.

3.6d. The $\&$ and $\backslash\backslash$ special moves are included to make it simple to enter ‘matrix-like’ things as graphs – note that they will not be automatically aligned, however, for that you should use the $\!M$ escape.

$\&$ is the same as $[r]$ and $\backslash\backslash$ is the same as $[r]!\{y+(0,-1)-(0,0)\}$ which uses a kernel escape to moves to the first column in the next row (where the first column is on the y -axis of the current coordinate system).

Note: If you use the form $*\{...\}$ for nodes then you don’t have to change them if you decide to use an $\mathbb{X}\mathbb{Y}$ -matrix.

3.6e. Typeset $\langle \text{it} \rangle$ and make it the current node. Also saves $\langle \text{it} \rangle$ for later reference using " $\langle \text{id} \rangle$ ": if $\langle \text{it} \rangle$ is a simple letter, or digit, then just as " $\langle \text{it} \rangle$ "; if $\langle \text{it} \rangle$ is of the form $\{ \text{text} \}$ or $*\dots\{ \text{text} \}$ then as " text ".

With the = addition it is possible to save explicitly in case several nodes have the same text or a node has a text that it is impractical to use for reference. In fact using the form $\langle \text{it} \rangle = \langle \text{id} \rangle$ will *only* save the node as " $\langle \text{id} \rangle$ " and *not* as " $\langle \text{it} \rangle$ "! As a special convenience "" (thus the empty $\langle \text{id} \rangle$) always refers to the last completed node, so adding "=" after a node merely means it should *not* be saved under its proper name.

Exercise 3.12: How did the author typeset this?

$$A \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} A \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} A$$

(p.583)

3.6f. Moving by a series of *hops* is simply moving in a grid as the sequence of du1r (for down/up/left/right) indicates. The grid is a standard cartesian coordinate system with 3pc unit unless the current base is redefined using $[\]!\{...\}$ with an appropriate $\langle \text{pos} \rangle$ ition containing : and :: as described in note 1.3d.

To Do: Describe the use of $\langle \text{move} \rangle$ s with $\langle \text{place} \rangle$ s in detail ... in particular (1) ‘until perpendicular to ...’ and (2) ‘until intercepts with ...’ can be coded...

3.6g. This ‘escapes’ into the X_Y-pic kernel language and interprets the $\langle \text{pos} \rangle$ $\langle \text{decor} \rangle$. The current node is then set to the resulting c object and the grid from the resulting $base$.

The effect of the $\langle \text{pos} \rangle$ $\langle \text{decor} \rangle$ can be completely hidden from X_Y-graph by entering it as $\{\backslash\text{save} \langle \text{pos} \rangle \langle \text{decor} \rangle \backslash\text{restore}\}$.

```

428 \xydef@NOD@escape{%

434 \else \DN@{\xyerror@{Unknown graph <escape>}}\xyFN@NOD@i}%
435 \fi\fi\fi\fi\fi \next@}

```

3.6h. It is possible to insert a $\langle \text{matrix} \rangle$ in a graph provided the ‘matrix’ option described in §3.5 has been loaded: it overwrites the node with the result of $\backslash\text{ymatrix}\langle \text{matrix} \rangle$. Afterwards the graph grid is set as the top left ‘square’ of the matrix, *i.e.*, with $[d]$ and $[r]$ adjusted as they work in the top left entry.

Bug: $[dr]$ immediately after the matrix will work as expected, *e.g.*, make the center of “2,2” the current node, but others might not, *e.g.*, $[rr]$ will not necessarily place the current node on top of “1,3”.

```

453 \xydefcsname@{graph !M}#1#\NOD@matrix{#1}

474 \ifx\next@\relax\else
475 \next@ \setbase@@{-\X@c}\{-\Y@c}\fi\fi\fi
476 \leave@}}

```

3.6i. It is possible to insert a $\langle \text{polygon} \rangle$ or an $\langle \text{ellipse} \rangle$ in a graph provided the `poly` option described in §3.7 or the `arc` option described in §3.9 has been loaded, respectively: it will have c as the current node, p as the previous one, and the the current base has the $\langle \text{hop} \rangle$ s $[r]$ and $[u]$ as base vectors.

Note: lattices, knots, *etc.*, can also be used but no special syntax is useful since the $!\{...\}$ syntax is adequate.

```

493 \xydefcsname@{graph !P}#1#{\NODE@poly{#1}}
494 \xydef@NODE@poly#1#2{\xyerror@{poly(gon) feature not loaded}{}}\xyFN@GRAPH@}
495 \xydef@NODE@poly@#1#2{\xy@{!P#1{#2}}{}}\xypoly@#1{#2}\xyFN@NODE@i}
496 \xywithoption{poly}{\let\node@poly=\NODE@poly@}
498 \xydefcsname@{graph !E}#1#{\NODE@arc{#1}!}

500 \xyFN@GRAPH@}
501 \xydef@NODE@arc@#1#2{\xy@{!E#1{#2}}{}}\ellipse#1{#2}\xyFN@NODE@i}
502 \xywithoption{arc}{\let\node@arc=\NODE@arc@}

```

3.6j. This allows setting of some parameters of the graph: !~⟨setup⟩ should be one of the following:

!~:{ ⟨arrow⟩ }	include with every : arrow
!~-{ ⟨arrow⟩ }	include with every - line
!~*{ ⟨modifiers⟩ }	include with every non-* node
!~⟨letter⟩{ ⟨graph⟩ }	define new graph escape !⟨letter⟩

These are destructive: the previous value is lost; the default is established by the sequence !~:{ !~-{@{-}} !~*{+} making : create simple arrows, - plain lines, and formatting default nodes in math mode with the default objectmargin.

```

528 \xylet@GRAPHeveryarrow@=\empty
530 {\xyuncatcodes \gdef\next@{-}}
531 \xylet@GRAPHeveryline@=\next
533 \xydef@graphsetup@~{\xyFN@graphsetup@i}
535 \xydef@graphsetup@i{%
536 \ifx :\next \DN@##1{\def\GRAPHeveryarrow@{##1}\xyFN@NODE@i}%
537 \else\addDASH@ \ifx \next
538 \addDASH@\DN@##1{\def\GRAPHeveryline@{##1}\xyFN@NODE@i}%
539 \else\ifx *\next \DN@*##1{\def\GRAPHnodemodifiers@{##1}\xyFN@NODE@i}%
540 \else\ifcat A\next \DN@##1##2{\newgraphescape{##1}{##2}\xyFN@NODE@i}%
541 \else \DN@{\xyerror@{illegal graph setup \codeof\next@}}\xyFN@NODE@i}%
542 \fi\fi\fi\fi \next@}

```

The last possibility is also available as a command

$$\backslash\text{newgraphescape}\{\langle\text{letter}\rangle\}\{\langle\text{graph}\rangle\}$$

that makes the specified escape generate the ⟨graph⟩ as a macro; with it it is possible to pass arguments to the ⟨graph⟩ using the standard \TeX `\def` method: The declaration code

```

\newgraphescape{i}#1#2{
[]!{+0="o#2"*=<10pt>{}};p!#1**{,"o#2"
-/4pt/*!E\cir<2pt>{}}
+0;p-/:a(-30)24pt/**\dir{-}="X2"
;p-/:a(-60)24pt/="X1"*\dir{-}
;?(.5),="i#2",
p-/:a(-60)24pt/**\dir{-},
"o#2"."i#2"."X1"."X2"}}

```

is (rather complicated kernel code) that makes the node escape `!idn` typeset an ‘inverter’ oriented with the d corner as the output with input named "in" and output named "on" such that the graph

```
\xygraph{ []!iR1 ("i1"[l]x - "i1") - [r]z }
```

will typeset

The `\newgraphescape⟨letter⟩` declaration defines a macro with name `\graph !⟨letter⟩`. It is slightly complicated by the fact that we accept L^AT_EX-style `[n]` arguments (when using L^AT_EX, that is ☺). Thus an internal macro named `\G!⟨letter⟩` is defined using the appropriate command definition primitive; this is in turn invoked by `\graph !⟨letter⟩` after activating the `⟨graph⟩` parser.

```
596 \xydef@newgraphescape#1{%
597   \expandafter\let\expandafter\next\csname graph !#1\endcsname
598   \ifx\next\relax\else \expandafter\let\csname G!#1\endcsname=\undefined
599   \xywarning@{Redefining graph <escape> !#1}\fi
600   \expandafter\gdef\csname graph !#1\endcsname{%
601     \expandafter\let\expandafter\next\csname G!#1\endcsname
602     \expandafter\xyFN@\expandafter\NODE@\next}%
603   \DN@{\newgraphescape@{#1}}\xyFN@\next@}
605 \xydef@newgraphescape@#1{%
606   \ifx [\next %]
607     \ifx\newcommand\undefined \xyerror@{[n] only with LaTeX}%
608     \else
609       \def\nextiv@{\expandafter\newcommand\expandafter{\csname G!#1\endcsname}}\fi
610     \else \def\nextiv@{\expandafter\gdef\csname G!#1\endcsname}\fi \nextiv@}

3.7 Polygon feature

Vers. 3.10 by Ross Moore <ross.moore@mq.edu.au>

This feature provides a means for specifying the locations of vertices for regular polygons, with any number (≥ 3) of sides. Polygons can be easily drawn and/or the vertex positions used to construct complex graphics within an X_y-picture. Many non-regular polygons can be specified by setting a non-square basis.

27 {Mathematics Department, Macquarie University, NSW~2109, Australia}

```

Some of the effects use `\ar` so make sure the ‘arrow’ feature is loaded.

```

44 \xyrequire{arrow}\xycatcodes
50 \message{polygons,}

```

A polygon is most easily specified using ...

```

\xypolygon⟨number⟩{ } with ⟨number⟩ sides;
\xypolygon⟨number⟩{⟨tok⟩} ⟨tok⟩ at vertices;
\xypolygon⟨number⟩{⟨object⟩}
with a general ⟨object⟩ at each vertex;

```

Here $\langle \text{number} \rangle$ is a sequence of digits, giving the number of sides. If used within an `\xy... \endxy` environment then the polygon will be centred on c , the current $\langle \text{pos} \rangle$. However an `\xypolygon` can be used outside such an environment, as “stand-alone” polygon; the whole picture must be specified within the `\xypolygon` command.

In either case the shape is obtained by spacing vertices equally around the “unit circle” with respect to the current basis. If this basis is non-square then the vertices will lie on an ellipse. Normally the polygon, with at most 12 vertices, is oriented so as to have a flat base when specified using a standard square basis. With more than 12 vertices the orientation is such that the line from the centre to the first vertex is horizontal, pointing to the right. Any other desired orientation can be obtained, with any number of vertices, by using the `~={...}` as described below.

The general form for `\xypolygon` is ...

$$\backslash xypolygon\langle number \rangle\langle prefix \rangle\{ \langle switches \rangle \dots \}$$

where the "`\langle prefix \rangle`" and "`\langle switches \rangle`" are optional. Their uses will be described shortly.

A `\xypolygon` establishes positions for the vertices of a polygon. At the same time various things may be typeset, according to the specified `\langle switches \rangle`. An `\langle object \rangle` may be dropped at each vertex, "spokes" drawn to the centre and successive vertices may be connected as the polygon's "sides". Labels and breaks can be specified along the spokes and sides.

Each vertex is automatically named: "1", "2", ..., "`\langle number \rangle`" with "0" as centre. When a `\langle prefix \rangle` has been given, names "`\langle prefix \rangle 0`", ..., "`\langle prefix \rangle \langle number \rangle`" are used instead. While the polygon is being constructed the macro `\xypolynum` expands to the number of sides, while `\xypolynode` expands to the number of each vertex, spoke and side at the time it is processed. This occurs in the following order: *vertex1, spoke1, vertex2, spoke2, side1, vertex3, spoke3, side2, ..., vertex n, spoke n, side n - 1, side n* where the final side joins the last vertex to the first.

The macro `\xypolygonname` holds the name of the polygon, which is `\langle prefix \rangle` if supplied. In this case the value of `\xypolynum` is also stored as `\langle prefix \rangle NUMSIDES`, accessible outside the polygon.

As stated above, a polygon with up to 12 vertices is oriented so as to have a flat base, when drawn using a standard square basis. Its vertices are numbered in anti-clockwise order, commencing with the one at horizontal-right of centre, or the smallest angle above this (see example below). With more than 12 vertices then vertex "1" is located on the horizontal, extending to the right from centre (assuming a standard square basis). By providing a switch of the form `\sim=\{ \langle angle \rangle \}` then the vertex "1" will be located on the unit circle at `\langle angle \rangle^\circ` anti-clockwise from "horizontal" — more correctly, from the X-direction in the basis to be used when setting the polygon, which may be established using a `\sim:\{ \dots \}` switch.

Exercise 3.14: Give code to typeset these. (p.584)

One important use of `\langle prefix \rangle` is to allow the vertices of more than one polygon to be accessed subsequently within the same picture. Here are some examples of this, incorporating the `\sim:\{ \dots \}` switch to perform simple rescalings. Firstly the edges of a dodecahedron as a planar graph:

```
\xy /11.5pc/:,\{ \xypolygon5"A"{} \},
\{ \xypolygon5"B" \sim:\{(1.875,0): \sim>{} \} \},
```

```

{\xypolygon5"C"~:{(-2.95,0):}>{}}},
{\xypolygon5"D"~:{(-3.75,0):}}},
{"A1"\PATH~={**@{-}}' "B1" ' "C4" ' "B2"},
{"A2"\PATH~={**@{-}}' "B2" ' "C5" ' "B3"},
{"A3"\PATH~={**@{-}}' "B3" ' "C1" ' "B4"},
{"A4"\PATH~={**@{-}}' "B4" ' "C2" ' "B5"},
{"A5"\PATH~={**@{-}}' "B5" ' "C3" ' "B1"},
"C1"; "D1" **@{-}, "C2"; "D2" **@{-},
"C3"; "D3" **@{-}, "C4"; "D4" **@{-},
"C5"; "D5" **@{-} \endxy

```

Next a hexagonal pyramid, a rectangular box and an octahedral crystal specified as a triangular anti-prism. Notice how the `~:{...}` switch is used to create non-square bases, allowing the illusion of 3D-perspective in the resulting diagrams:

```

\xy/r2pc/: ="A", +(.2,1.5)="B", "A",
{\xypolygon6~:{(1,-.1):(0,.33)::}
~<>{"B" **@{-}}}\endxy
\quad \xy /r2pc/:
{\xypolygon4"A"~:{(0,.7)::}}},+ (.7,1.1),
{\xypolygon4"B"~:{(.8,0):(0,.75)::}}},
"A1"; "B1" **@{.}, "A2"; "B2" **@{.},
"A3"; "B3" **@{.}, "A4"; "B4" **@{.}
\endxy\quad \xy /r2pc/:
{\xypolygon3"A"~:{(0,.7)::}}},+ (.7,1.1),
{\xypolygon3"B"~:{(-.85,0):(-.15,.8)::}}},
"A1"\PATH~={**@{.}}' "B2" ' "A3" ' "B1"
' "A2" ' "B3" ' "A1" \endxy

```

`\xypolynode` simply reads the value of a counter called `\xypolynode@`. It is set initially at -1, to indicate no polygon yet. This is used to establish the default naming in case polygons are nested.

```

210 \xynew@{count}\xypolynode@\xypolynode@=\m@ne

Vertex object: Unless the first character is ~, signifying a “switch”, then the whole of the braced material is taken as specifying the (object) for each vertex. It will be typeset with a circular edge using `\drop[o]...`, except when there is just a single token (tok). In this case it is dropped as `\drop=0{tok}`, having zero size. An object can also be dropped at each vertex using the switch `~*{...}`, in which case it will be circular, with the current *objectmargin* applied.

The next example illustrates three different ways of specifying a `\circ` at the vertices.

```

Switches

The allowable switches are given in the following table:

$\sim\{\dots\}$	useful for rescaling.
$\sim*\{\langle\text{object}\rangle\}$	$\langle\text{object}\rangle$ at each vertex.
$\sim=\{\langle\text{angle}\rangle\}$	align first vertex.
$\sim\langle\{\dots\}$	directional for “spokes”;
$\sim\langle\langle\{\langle\text{arrow}\rangle\}$	use $\langle\text{arrow}\rangle$ for spokes;
$\sim\langle\rangle\{\dots\}$	labels & breaks on spokes.
$\sim\rangle\{\dots\}$	directional for “sides”;
$\sim\rangle\langle\{\langle\text{arrow}\rangle\}$	use $\langle\text{arrow}\rangle$ for sides;
$\sim\rangle\rangle\{\dots\}$	labels & breaks on sides.

Using $\sim\langle\langle\{\langle\text{arrow}\rangle\}$ or $\sim\rangle\langle\{\langle\text{arrow}\rangle\}$ is most appropriate when arrowheads are required on the sides or spokes, or when labels/breaks are required. Here $\langle\text{arrow}\rangle$ is as in figure 3.2, so it can be used simply to specify the style of directional to be used. Thus $\sim\langle\langle\{\}$ sets each spoke as a default arrow, pointing outwards from the centre; $\sim\langle\langle\{\@\{-}\}$ suppresses the arrowhead, while $\sim\rangle\langle\{\@\{\}$ uses an empty arrow along the sides. Labels and breaks are specified with $\sim\langle\rangle\{\dots\}$ and $\sim\rangle\rangle\{\dots\}$, where the $\{\dots\}$ use the notation for a $\langle\text{label}\rangle$, as in figure 3.1.

When no tips or breaks are required then the switches $\sim\langle\{\dots\}$ and $\sim\rangle\{\dots\}$ are somewhat faster, since less processing is needed. Labels can still be specified with $\sim\langle\rangle\{\dots\}$ and $\sim\rangle\rangle\{\dots\}$, but now using the kernel’s $\langle\text{place}\rangle$ notation of figure 1.1. In fact any kernel code can be included using these switches. With $\sim\langle\rangle$ the current p and c are the centre and vertex respectively, while for $\sim\rangle\rangle$ they are the current vertex and the previous vertex. (The connection from vertex “ $\langle\text{number}\rangle$ ” to vertex “1” is done last.) The pyramid above is an example of how this can be used. Both $\sim\langle\{\dots\}$ and $\sim\langle\langle\{\langle\text{arrow}\rangle\}$ can be specified together, but only the last will actually be used; similarly for $\sim\rangle\{\dots\}$ and $\sim\rangle\langle\{\langle\text{arrow}\rangle\}$.

```

\def\alphanum{\ifcase\xpolygon\or A
\or B\or C\or D\or E\or F\or G\or H\fi}
\xy/r3pc/: {\xypolygon3{~={40}}},
{\xypolygon4{~={40}~>{--}}},
{\xypolygon5{~={40}}},
{\xypolygon6{~={40}~>{--}}},
{\xypolygon11{~={40}}},
{\xypolygon50{~={40}~>}.}, +/r8pc/,
{\xypolygon7{~<<{@{-}}~><{}
~<>{|*{@{x}}~*{\alphanum}
~>>{_{\alpha_}\xpolygon^{} }}}
\endxy

```

Use of the $\sim=\{...\}$ switch was described earlier. When using the $\sim:\{...\}$ more can be done than just setting the base. In fact any kernel code can be supplied here. It is processed prior to any other part of the polygon. The graphics state has c at the centre of the polygon, p at the origin of coordinates within the picture and has basis unchanged from what has previously been established. The current point c will be reset to the centre following any code interpreted using this switch.

Note that $\sim!$ was appended by $\xypoly@@$, in order to indicate the end of the braced tokens. The macro $\xypolywhich@$ is the main parser, with $\xypoly@SPOKES@$ and $\xypoly@SIDES@$ handling the subcases for $\sim<$ and $\sim>$.

497 \let\xypreSIDES@\relax \def\xypolySIDES@{##1}\xyFN@\xypolyparams@}%
498 \fi\fi\fi \next@ }

```

A further simplification exists for sides and spokes without \langle arrow \rangle s. If \langle tok \rangle is a single character then $\sim>\langle$ tok \rangle , $\sim>\{\langle$ tok $\rangle\}$, $\sim>\{\{\langle$ tok $\rangle\}$ all specify the directional $\backslash\text{dir}\{\langle$ tok $\rangle\}$; similarly with the $\sim<$ switch. On the other hand, compound directionals require all the braces, e.g. $\sim>\{\{\--\}\}$ and $\sim>\{2\{.\}\}$.

This is achieved with the macro $\backslash\text{checkpolytok}\@#1\#2\#3\#4@!\#5$ which handles the bare \langle tok \rangle case by adding braces around \langle tok \rangle which has been passed as #3, preceding it with #2. This is then $\backslash\text{def}$ 'd to the control-sequence name passed as #1. Finally continue with the command passed as #5.

```

518 \xydef@\checkpolytok@#1#2#3#4@!\#5{\DNii@{#1}\DN@{#4}%
519 \ifx\next@\empty\expandafter\def\nextii@{}}%
520 \else\ifx#4@\expandafter\def\nextii@{#2{#3}}\fi\fi #5}

```

After all switches have been processed, remaining tokens are used to specify the \langle object \rangle for each vertex. Such tokens will be used directly after a $\backslash\text{drop}$, so can include object \langle modifier \rangle s as in figure 1.5. If an \langle object \rangle has already been specified, using the $\sim*$ switch, then the following message will be written to the $\text{T}_\text{E}_\text{X}$ log:

Xy-pic Warning: vertex already specified, discarding unused tokens:

with tokens at the end indicating what remains unprocessed. Similarly extra tokens before the $\{\dots\}$ generate a message:

Xy-pic Warning: discarding unused tokens:

Nested Polygons

When $\backslash\text{xypolygon}$ is specified within either a $\sim<>\{\dots\}$ or $\sim>>\{\dots\}$ switch for another polygon, then the inner polygon inherits a name which incorporates also the number of the part on which it occurs, as given by $\backslash\text{xypolynode}$. This name is accessed using $\backslash\text{xypolyname}$. In the following example the inner polygon is placed using $\sim<>$ in order to easily adjust its orientation to the outward direction of the spokes.

```
\xypolygon4{~:{/r5pc/:}
~<>{* \frm<8pt>{o}\xypolygon4{~:{/ -2pc/:}
~*{\xypolynome\xypolynode}}
[o]=<5pc>{\xypolynode}}
```

Notice how nested polygons inherit names "1,1", "1,2", ..., "4,1", ..., "4,4" for their vertices. If a ⟨prefix⟩ is supplied at the outermost level then the names become: "⟨prefix⟩*i,j*". Specifying a ⟨prefix⟩ for the inner polygon overrides this naming scheme. The same names may then be repeated for each of the inner polygons, allowing access afterwards only to the last—possibly useful as a memory saving feature when the vertices are not required subsequently.

Four levels of nesting gives a quite acceptable “Sierpinski gasket”. The innermost triangle is provided by `\blacktriangle` from the \mathcal{AMS} symbol font `msam5`, at 5-point size. Further levels can be achieved using the `POSTSCRIPT` backend, otherwise line segments become too small to be rendered using `Xy`-fonts.

```
\font\msamv=msam5 at 5pt
\def\blacktriangle{\msamv\char'116}
\def\objectstyle{\scriptscriptstyle}
\xypolygon3{~:{/r5.2pc/:}
~>{}~<>{?\xypolygon3"a"~: {( .5,0) :}
~>{}~<>{?\xypolygon3"b"~: {( .5,0) :}
~>{}~<>{?\xypolygon3"c"~: {( .5,0) :}
~>{}~<>{?\xypolygon3"d"~: {( .5,0) :}
~<>{?*/d.5pt/=0\hbox{\blacktriangle}}
}} }} }} }} }
```

Note the use of naming in this example; when processing this manual it saves 13,000+ words of main memory and 10,000+ string characters as well as 122 strings and 319 multi-letter control sequences.

```

Coordinates for the vertices are read from trigonometry tables using control sequences

<code>\cosPionn</code>	<code>\sinPionn</code>
<code>\cosTwoPionn</code>	<code>\sinTwoPionn</code>
<code>\cosThreePionn</code>	<code>\sinThreePionn</code>
<code>\cosFourPionn</code>	<code>\sinFourPionn</code>
<code>\cosFivePionn</code>	<code>\sinFivePionn</code>

which expand to the values of $\cos \frac{\pi}{n}$, $\sin \frac{\pi}{n}$, $\cos \frac{2\pi}{n}$, \dots , $\sin \frac{5\pi}{n}$ and are also available for other uses. The parameter n must be a non-negative integer up to 12. The complete table is in figure 3.6.

Specific Polygons: All the information from the switches is passed as 8 separate parameters to a macro appropriate to the number of sides. The parameters have the following uses, and are set as shown:

-
- #1 pre-arrow: set by `~<<{...}` else ;
 - #2 vertex ⟨object⟩, set by `~*{...}`
 - #3 prefix for naming
 - #4 post-vertex: empty with `\ars` else `**@{...}`
where `{...}` is set by `~<{...}`
 - #5 post-arrow/vertex: set by `~<>{...}`
 - #6 pre-edge/arrow, set by `~><{...}`
 - #7 post-edge: empty with `\ars` else `**@{...}`
where `{...}` is set by `~>{...}`
 - #8 post-arrow/edge, set by `~>>{...}`
-

The organisation of this information is done by `\xyPolygon@@@#1` which takes as a single parameter a macro appropriate to the number of sides, supplied by `\xypoly@@@`.

```

```

Here is `\xyPolygon@@@`. It constructs a list of tokens to be interpreted, after having closed the grouping that was current while parsing. It starts by setting the value of `\xypolyNUMSIDES@`, then a `\save` before adjusting the scale according to the value of `\xypolySCALE@`.

```

783 \xydef@\xyPolygon@@@#1{%
784 \toks@={\def\xypolyNUMSIDES@}%

823 \fi
824 \expandafter\DN@\expandafter{\expandafter\endgroup\the\toks@ }%
825 \next@}

```

Note how `\endgroup` closes the grouping. All the information for the layout of the polygon is contained in `\xypolyNUMSIDES@` and the specific polygon macro contained in the final `\next@`.

Here is where the polygons are defined, individually.

3.8 Lattice and web feature

Vers. 3.6 by Ross Moore <ross.moore@mq.edu.au>

This feature provides macros to facilitate typesetting of arrangements of points within a 2-dimensional lattice or “web-like” structure.

```

Currently the only routines implemented with this feature are some “quick and dirty” macros for dropping objects at the points of an integer lattice. **To Do:** More sophisticated routines will be developed for later versions of Xy-pic, as the need arises.

Mathematically speaking, let \vec{u} and \vec{v} be vectors pointing in independent directions within the plane. Then the lattice spanned by \vec{u} and \vec{v} is the infinite set of points L given by:

$$L = \{a\vec{u} + b\vec{v}; \text{ for } a, b \text{ integers}\}.$$

Within \Xy-pic the vectors \vec{u} and \vec{v} can be established as the current coordinate basis vectors. The following macros typeset a finite subset of an abstract lattice.

```

\xylattice#1#2#3#4    points in lattice
\croplattice#1#2#3#4#5#6#7#8
                    ... in specific rectangle.

```

The parameters #1 ... #4 are to be integers a_{\min} , a_{\max} , b_{\min} and b_{\max} , so that the portion of the lattice to be typeset is that collection of vectors in L for which $a_{\min} \leq a \leq a_{\max}$ and $b_{\min} \leq b \leq b_{\max}$.

```

\def\xlattbody{%
\ifnum\xlatticeA=1 \ifnum\xlatticeB=-1 %
\else\drop{\circ}\fi\else\drop{\circ}\fi}
\xy *\xybox{0;<1.5pc,1mm>:<1mm,1.5pc>::
,0,{\xylattice{-4}4{-3}3}
,(1,-1)="a"*{\bullet}**<2pt>!UL{a}
,(-1,1)."a"*\frm{.}}="L"
,{"L"+L \ar "L"+R**!L{s^{(1)}}}
,{"L"+D \ar "L"+U**!D{s^{(2)}}}
\endxy

```

In the above code, notice how the basis is first established then the \xylattice typeset. Doing this within an \xybox allows axes to be sized and placed appropriately. Since lattice points are determined by their (integer) coordinate displacements, they can be revisited to add extra (object)s into the overall picture. More generally, the origin for lattice-coordinates is the current (pos) c , when the \xylattice command is encountered. Easy accessibility is maintained, as seen in the next example.

When the basis vectors \vec{u} and \vec{v} are not perpendicular the collection of points with a, b in these ranges will fill out a skew parallelogram. Generally it is useful to plot only those points lying within a fixed rectangle. This is the purpose of \croplattice , with its extra parameters #5 ... #8 determining the ‘cropping’ rectangle within which lattice points will be typeset. Other points will not be typeset even when a and b are within the specified ranges. Explicitly the horizontal range of the cropping rectangle is X_{\min} to X_{\max} , with X_{\min} being the X -coordinate of the vector $\#5 \times \vec{u}$, where #5 is a (number) (not necessarily an integer). Similarly X_{\max} is the X -coordinate of $\#6 \times \vec{u}$. The vertical

extents are Y_{\min} and Y_{\max} , given by the Y -coordinates of $\#7 \times \vec{v}$ and $\#8 \times \vec{v}$ respectively.

```

With `\xylattice` getting the picture size correct is simply a matter of passing `\X@min`, `X@max`, etc. outside of the inner group. However with `\croplattice` these are first set to correspond to the ‘cropping rectangle’ then subsequently merged with their original values.

```

The `\latticebody` macro. At each lattice point within the specified range for a, b (and within the cropping rectangle when `\croplattice` is used), a macro called `\latticebody` is expanded. This is meant to be user-definable, so as to be able to adapt to any specific requirement. It has a default expansion given by ...

```
\def\latticebody{\drop{\bullet}}.
```

The following macros may be useful when specifying what to do at each point of the lattice.

<code>\latticebody</code>	expanded at lattice points
<code>\defaultlatticebody</code>	resets to default
<code>\latticeA</code>	a -value of lattice point
<code>\latticeB</code>	b -value of lattice point
<code>\latticeX</code>	X -coord, offset in pts...
<code>\latticeY</code>	Y -coord, ... from lattice origin.

As in the examples presented above, the object dropped at the lattice point can be varied according to its location, or omitted altogether.

The default `\latticebody` macro ...

```
265 \xydef@\deflatticebody@{\def\latticebody{\drop{\bullet}}}
```

```
266 \xydef@\defaultlatticebody@\deflatticebody@
```

```
267 \deflatticebody@
```

In the final example the `\latticebody` macro performs a calculation to decide which lattice points should be emphasised:

```
\def\latticebody{\dimen0=\latticeX pt
\ifdim\dimen0>0pt \divide\dimen0 by 64
\dimen0=\latticeY\dimen0 \relax
\ifdim 0pt>\dimen0 \dimen0=-\dimen0 \fi
\ifdim 10pt>\dimen0 \drop{\bullet}%
\else\drop{.}\fi \else\drop{.}\fi}
\xy*\xybox{0;<3pc,2.57mm>:<.83pc,2.25pc>::
,0,{\croplattice{-3}5{-5}5
```

```

{-1.3}{4.5}{-3.4}{4.4}}="L"
,{"L"+L \ar "L"+!R*+!L{\sigma^{(1)}}}
,{"L"+D \ar "L"+!U*+!D{\sigma^{(2)}}}
\endxy

```

3.9 Circle, Ellipse, Arc feature

Vers. 3.7 by Ross Moore <ross.moore@mq.edu.au>

This feature provides a means to specify circles of arbitrary radius, drawn with a variety of line styles. Similarly ellipses may be specified, having arbitrary major/minor axes aligned in any direction. A circular arc joining two points can be constructed with specified tangent direction at one end.

All the curves described here—circles, ellipses and sectors of these—are constructed using the curves from the `xycurve` extension. As such any comments given there concerning memory requirements are equally valid here, perhaps even more so. Use of the `xyps` POSTSCRIPT back-end is highly recommended.

106 \next@ }
```

When further parsing is required, using $\getarcparams@$, then an $@$ token is used to mark the end of the relevant tokens.

Before any parsing at all the current p and c are recorded as named $\langle pos \rangle$ itions $0@p$ and $0@c$, as well as a point $0@m$ along the line in the current direction from p . A method $\origDirection@$ is defined to artificially re-impose this direction independent of the p and c that may be current at the time. $\startDirection@$ is initialised to this method, though parsing may change its value. Other methods are initialised, in particular the default orientation; their values can be expected to change with subsequent parsing.

```

3.9.1 Full Circles

The \xyarc feature allows a much wider range of possibilities for typesetting circles than is available with \cir . Firstly the radius is no longer restricted to a finite collection of sizes. Secondly fancy line (curve) styles are available, as with curved arrows. Finally there are a variety of ways of specifying

the desired radius, relative to other parts of the picture being built, as in the following example.

```
\xy 0;/r5pc/:*\dir{*}="p",*+!DR{p};
p+(.5,-.5)*\dir{*}="c",*+++!L{c}**\dir{-}
,{\ellipse<>{:}},{\ellipse(.5){}}
,0;(.5,.5)::,"p";"c",{\ellipse(.5){.}}
,{\ellipse<5pt>{=}}\endxy
```

The following give circles centred at c .

<code>\ellipse<>{<style>}</code>	radius = $\text{dist}(p, c)$
<code>\ellipse<dimen>{. .}</code>	radius is the $\langle \text{dimen} \rangle$
<code>\ellipse(<num>){<style>}</code>	unit circle scaled $\langle \text{num} \rangle$, in the current basis.

Note that if the current basis is not square then the latter variant, namely `\ellipse(<num>)`, will typeset an ellipse rather than a circle. On the other hand the first two variants always specify true circles. In the 2nd case, i.e. when $\langle \text{dimen} \rangle$ is $\langle \text{empty} \rangle$, the size of the object at p is taken into account when drawing the circle; if this is not desired then kill the size using a null object, e.g. `;*{}`;

Currently the `\ellipse` macro works only as a $\langle \text{decor} \rangle$. In future versions there will be an $\langle \text{object} \rangle$ called `\arc` having elliptical shape, via `\circleEdge` with possibly unequal extents. Also it will be possible to `\connect\arc`, which will set the current connection so that any place on the full ellipse, not just the visible sector, will be accessible using an extension to the usual $\langle \text{place} \rangle$ mechanism.

To Do: make this be!!

The simplest cases of full circles go straight to `\circleArc@`.

```
190 \xydef\fullCircle@\{ \xy@{fullCIRC}\let\endDirection@=\relax
191 \let\doCircleArc@=\doMergeEndArc@@}\circleArc@ }%
```

If the first non-space token following `\arc` is $\langle \text{<}>$ then the current c is taken to be the centre of the circle or ellipse, or sector thereof. The first parsing is done to interpret information concerning the radius, (or axes of an ellipse) along with an orientation. This can be specified either as absolute dimensions, enclosed in $\langle \dots \rangle$, or relative to the current basis by (\dots) , or based on the line \overline{pc} using $\langle \rangle$ or $\langle, \langle \text{dimen} \rangle$ or $(, \langle \text{num} \rangle)$.

```
203 \xydef\getarcparams@{%
204 \ifx\space@\next \expandafter\DN@\space{\xyFN@\getarcparams@}%gobble spaces
205 \else\addLT@\ifx \next \xy@{<>}%
206 \addGT@{\addLT@\DN@##1}\splitRadius@dim##1,,@}%
207 % \else\ifx \next (\xy@{({})}\DN@(#1)\splitRadius@##1,,@}%
208 \else\ifx\next (\DN@{\xyFN@\checkRadOpen}%
209 \else\ifx\next @\xy@{@}\DN@ @{\fullEllipse@}%
210 \else \addLQ@\ifx \next \addLQ@\DN@{\xy@'\}\ARCturn@}%
211 \else \DN@{\getarcExtents@}%
212 \fi\fi\fi\fi\fi \next@ }
```

```

214 \xydef@\checkRadOpen@{%
215 \ifx\next *DN@{\xyFN@\getarcExtents@ }%
216 \else \xy@{ }{\DN@##1}{\splitRadius@##1,,@}%
217 \fi \next@ }

```

The centre is now stored as "000", since the value of "00c" will be changed to agree with "00p". This is so that start/finish directions will agree, ensuring all four quadrants be drawn. The following method is actually executed after all the radius/axes information has been parsed.

```

227 \xydef@\fixedRadiusArc@{%
228 \xy@{\fixRadArc}{\save@ idfromc@{000}\cfromp@idfromc@{00c}\leave@}%
229 \xyFN@\fixedRadiusArc@i }
231 \xydef@\fixedRadiusArc@i{%
232 \ifx\next \space@ \expandafter DN@ \space{\xyFN@\fixedRadiusArc@i}%
233 \else\ifx\next @\xy@{ }{ }DN@ @{\fullEllipse@}%
234 \else DN@{\let \processDirections@=\processArcDirections@
235 \def\afterARCExtents@{\xy@{aftARCExt}}{\let \doCircleArc@=\doCircleArc@
236 \ellipseSector@}}\xyFN@\getarcExtents@}%
237 \fi\fi \next@ }

```

When a full circle or ellipse is required then there are three methods which must be invoked when establishing the local basis change.

`\arcScale@` Initially this has value `\arcScale@@` which is based on \overline{pc} . It is changed only by $(\langle \text{num} \rangle)$ and $(\langle \text{num} \rangle, \langle \text{num} \rangle)$; see the code for `\splitRadius@` below. When executed, this method will establish the required basis, at least partially.

```

251 \xydef@\arcScale@@{\xy@{arcSCALE@@}}{\save@
252 \cfromid@{000}\pfromc@\cfromid@{00p}\setbase@\X@p\Y@p\X@c\Y@c}}

```

`\arcRadius@` Initially $\langle \text{empty} \rangle$, this changes with $\langle \text{dimen} \rangle, \langle \text{dimen} \rangle$ and $\langle \text{dimen} \rangle$ to `\arcScale@dim` which gets the radius by a $\langle \text{slide} \rangle$ of given $\langle \text{dimen} \rangle$ along the line \overline{pc} .

```

261 \xydef@\arcScale@dim#1{\xy@{arcSCALEdim}}{\save@
262 \cfromid@{000}\pfromc@\cfromid@{00p}\setupDirection@\cfromp@
263 \enter@\cplusthec@ \begingroup\vfrofromslide@i#1@%
264 \setbase@\X@p\Y@p\X@c\Y@c idfromc@{00p}}}

```

`\ellipseRatio@` Initially $\langle \text{empty} \rangle$, this changes with $\langle \text{dimen} \rangle, \langle \text{dimen} \rangle$ to `\ellipseScale@dim` which establishes the $(\text{X@basey}, \text{Y@basey})$ by a $\langle \text{slide} \rangle$ perpendicular to the line \overline{pc} , or to `\ellipseScale@` with $(, \langle \text{num} \rangle)$ to simply set the perpendicular basis direction using $\langle \text{num} \rangle$ as a coordinate.

```

276 \xydef@\ellipseScale@dim#1{\xy@{ellSCALEdim}}{\setupDirection@\cfromp@
277 \enter@\cplusthec@ \aboveDirection@\xydashl@ \vfrofromslide@{#1}\leave@
278 \setbase@@\X@c\Y@c}}
280 \xydef@\ellipseScale@#1{\xy@{ellSCALE@}%
281 {\vfrofromcartesian@@0,#1@\setbase@@\X@c\Y@c}}

```

The methods `\splitRadius@dim` and `\splitRadius@` complete the interpretation of the radius/axes specification. They must determine whether one or two pieces of information have been explicitly provided, and act accordingly.

```

332 \message{ellipses,}

```

3.9.2 Ellipses

There are several ways to specify an ellipse, apart from the method illustrated above in which the basis must be changed from square. Basically we must specify the lengths of the major and minor axes. Also it is necessary to specify an alignment for one axis.

In the following, the ellipse is centred on c and one axis is aligned along the line \overline{pc} , except with the final variant where it aligns with the current basis. When used $\langle \text{num} \rangle$ is treated as a scale factor, multiplying an appropriate length.

<code>\ellipse<dimen>, <dimen>>{..}</code>	given axes lengths
<code>\ellipse<, <dimen>>{<style>}</code>	one axis is \overline{pc}
<code>\ellipse(<num>){<style>}</code>	...perp. axis scaled
<code>\ellipse<num>, <num>>{..}</code>	scaled axes aligned with basis.

In the latter variant, if the second $\langle \text{num} \rangle$ is $\langle \text{empty} \rangle$ then this is equivalent to both $\langle \text{num} \rangle$ s having the same value, which is in turn equivalent to the final variant for circles.

```
\xy 0;/r5pc/:*\dir{*},*+!DR(.5){p}
*\frm{-};p+(.5,-.5)*\dir{*}="c",
**\dir{-},*+!UL{c},"c",
,{\ellipse(1,.4){:}},{\ellipse(,.75){}}
,{\ellipse<15pt,10pt>{=}}
;{*};{\ellipse<,10pt>{.}}\endxy
```

As with full circles, full ellipses require little preparation.

```
376 \xydef\fullEllipse@\xy@{\fullELLIPSE}%
377 {\def\startDirection@{\let\doCircleArc@=\doMergeEndArc@@}%
378 \ellipseArc@
379 \xy@{\doCIRCcarcs}{\leave@ \doCircleArcs@}\endarc@ }
```

3.9.3 Drawing arcs

This method is common to full circles, ellipses and circular arcs. It first executes the methods $\backslash\text{arcScale@}$, $\backslash\text{arcRadius@}$, $\backslash\text{ellipseRatio@}$ where necessary, then examines $\backslash\text{arcOrient@@}$ to decide if the arc is to be typeset clockwise or counter-clockwise.

```
392 \xydef\ellipseArc@{%
393 \arcScale@ \arcRadius@ \ellipseRatio@
394 \xy@{\arcCONTROLS}{\baseOrient@ \arcControls@ \let\bstartPLACE@=\relax }}
```

Here is where the “control points” are defined, for each of the four Bézier cubic segments, using coordinates in the constructed basis. The endpoints of the segments—though, not necessarily of the arc—are stored as $0p$, $1c$, $2c$, $3c$ and the tangential control points are stored as $1m$, $2m$, \dots , $8m$.

```
404 \xydef\cubicARCcontrols@@{\czeroEdge@
405 \vfromcartesian@@0,1@idfromc@{1@c}%
406 \vfromcartesian@@-1,0@idfromc@{2@c}%
407 \vfromcartesian@@0,-1@idfromc@{3@c}%
408 \vfromcartesian@@1,\arcparam@ @idfromc@{1@m}%
409 \vfromcartesian@@\arcparam@,1@idfromc@{2@m}%
410 \vfromcartesian@@-\arcparam@,1@idfromc@{3@m}%
411 \vfromcartesian@@-1,\arcparam@ @idfromc@{4@m}%
412 \vfromcartesian@@-1,-\arcparam@ @idfromc@{5@m}%
413 \vfromcartesian@@-\arcparam@,-1@idfromc@{6@m}%
414 \vfromcartesian@@\arcparam@,-1@idfromc@{7@m}%
415 \vfromcartesian@@1,-\arcparam@ @idfromc@{8@m}%
416 }
```

Drawing the circle/ellipse/arc means tracing along the requisite cubic segments. The method $\backslash\text{doCircleArc@@}$ is used for full circles/ellipses when complete segments are to be typeset. The

methods `\doMergeStartArc@`, `\doMergeEndArc@@` and `\doMergeBothArc@` are used when a segment is not complete. The work by “merging” the initial/final point of the curved segment with the appropriate point required to be at the extremity of the arc. Typesetting of the curve should not take place within the region covered by this merged object.

To overcome the difficulty of the curve leaving then re-entering this region, a second merge is performed to extend it suitably. This is the purpose of `\cfromcontrols@`. Due to the “convex-hull property” of the Bézier cubic segment, a point can be constructed from the end-points and control points which can be used to extend the rectangle to cover a suitable portion of the curve.

```

```

The next method controls which segments are typeset. It is rather primitive and could well be improved; e.g. to be more like `\doEllipseSectors@` with `\forwardSectors@` and `\backwardSectors@`.

First it calculates the `\startDirection@@` as a number, using the current base. Next it calculates `\quadDirection@` which records the angle of the y -axis in the current base. Depending on the required orientation, read from `\arcOrient@@`, this latter number is adjusted to be minimal greater than `\startDirection@@` for a counter-clockwise arc, or maximal less than it for a clockwise one. Similarly the value of `\endDirection@@` is made larger or smaller than `\startDirection@@`, according to orientation, by adding ± 8192 if necessary.

Each required segment is typeset using `\doCircleArc@@` except that the final segment uses the value of `\doCircleArc@`. When the end-point is the original c then this value is `\doMergeEndArc@@`,

so that the arc will stop at the edge of this $\langle \text{pos} \rangle$, otherwise `\doCircleArc@@` is used.

(The following macro can be shortened by making use of the methods `\forwardSectors@` and `\backwardSectors@`, as in `\doEllipseSectors@`.

653 \message{elliptical arcs,}

```

3.9.4 Circular and Elliptical Arcs

The `xyarc` feature handles arcs to be specified in two essentially different ways, according to what information is provided by the user. We call these the “radius-unknown/end-points known” and the “radius-known/end-points unknown” cases.

radius unknown, end-points known

The simplest case, though not necessarily the most common, is that of a circular arc from p to c , with radius and centre unspecified. To uniquely specify the arc, the tangent direction at p is taken to be along the current direction, given by `\Direction`, as set by the latest `<connect>`ion. If no connection has been used, then the default `<direction>` is “up”.

```

\ellipse_{<style>} clockwise arc from  $p$  to  $c$ 
\ellipse^{<style>} counter-clockwise arc
\ellipse{<style>} also counter-clockwise

```

With this information only, a unique circle can be found whose radius and centre need not be specified in advance. For a unique arc it is sufficient to specify the orientation around the circle.

The exception is when the current direction is from p to c , in which case no circle exists. Instead a straight line is typeset accompanied by the following message:

Xy-pic Warning: straight arc encountered

The following example shows how, given three points o , p and c , to continue the line \overline{op} by a circular arc to c joining smoothly at p .

```

\xy 0;/r5pc/:*+&dir{*}**!UR{p};
p+(.5,-.5)*&dir{*}="o",**!UL{o}
,+(0,.81)*=<6.1pt>&dir{*}&frm{-}="c"
,**!DL{c},"o",**&dir{-},
"c",{&ellipse_{}},{{&ellipse^{.}}}}
%
,"o"+(1.5,.2)*&dir{*}="a"**!UL{a}
,"o";p+/_1pc/,**{,"a",{&ellipse_{}}}}
\endxy

```

Note how the remainder of the circle can be specified separately. The example also shows how to specify an arc which leaves a particular point perpendicular to a specific direction.

Slightly more complicated is when the tangent direction at p is specified, but different from the current direction; a unique circular arc can still be defined. More complicated is when a specific tangent direction is required also at c . In this case the arc produced is a segment of an ellipse. (If the required tangent at p points to c then a straight segment is drawn, as in the circular case described above.)

<code>\ellipse⟨dir⟩_p,⟨orient⟩{. .}</code>	circular
<code>\ellipse⟨dir⟩_p,⟨orient⟩,⟨dir⟩_c{. .}</code>	elliptical
<code>\ellipse⟨dir⟩_p,⟨orient⟩⟨dir⟩_c{. .}</code>	elliptical
<code>\ellipse⟨dir⟩_p,⟨orient⟩,=⟨dir⟩_c{. .}</code>	elliptical
<code>\ellipse‘⟨coord⟩⟨orient⟩{. .}</code>	elliptical

In these cases $\langle \text{dir} \rangle_p$ and $\langle \text{dir} \rangle_c$ are $\langle \text{direction} \rangle$ specifications, as in figure 1.5 and note 1.4l, and $\langle \text{orient} \rangle$ must be either \wedge or $_$ for anti-/clockwise respectively, defaulting to \wedge if $\langle \text{empty} \rangle$. Beware that the $(*\langle \text{pos} \rangle \langle \text{decor} \rangle *)$ form *must* be used for this $\langle \text{direction} \rangle$ variant, as if an object modifier.

The second and third cases in the above table generally give identical results. The second ‘,’ is thus optional, except in two specific situations:

1. $\langle \text{orient} \rangle$ is empty and $\langle \text{dir} \rangle_c$ has \wedge or $_$ as the first token;
2. $\langle \text{orient} \rangle$ is \wedge and $\langle \text{dir} \rangle_c$ has \wedge as first token. Without the , then $\wedge\wedge$ would be interpreted by T_EX as part of a special ligature for a hexadecimal character code.

If both $\langle \text{orient} \rangle$ and $\langle \text{dir} \rangle_c$ are $\langle \text{empty} \rangle$ then even the first ‘,’ can be omitted.

```
\xy 0;/r5pc/:*=<8.1pt>\dir{*}="p",*\frm{-}
,***!U{p},"p";p+(.5,-.5)*+\dir{*}="o"
,***!UL{o},+(0,.81)*=<8.1pt>\dir{*}="c"
,*\frm{-},***!L{c},"o"*\dir{-},"c"
,{\ellipse :a(50),_:0{:}}
,{\ellipse :a(30),_:a(-45){}}
,{\ellipse :a(40),_{.}},
;{*};{\ellipse :a(20),^=_{:}}\endxy
```

Note that only the slope of $\langle \text{dir} \rangle_p$ and $\langle \text{dir} \rangle_c$ is significant; rotations by 180° being immaterial.

```

\xy 0;/r5pc/:*\dir{*}="p",*+!UR{p}
;p+(.5,-.5)*\dir{*}="o",*+!L{o}**\dir{-}
;p+(.5,.5)*\dir{*}="c",*+!D{c},"c"
;p+(1,.1)*\dir{*}="q",*+!L{q}**\dir{-}
,"o";"p",**{"};"c"
,{\ellipse! [{"o";"p"}],_! [{"q";"c"}]{} }
,{\ellipse! [{"o";"p"}],! [{"c";"q"}]{} }
\endxy

```

The = variant establishes the $\langle \text{direction} \rangle$ parsing to begin with the direction resulting from $\langle \text{dir} \rangle_p$ instead of the original direction. If $\langle \text{dir} \rangle_c$ is required to be the original direction then use :0. It cannot be $\langle \text{empty} \rangle$ since this is interpreted as requiring a circular arc with unspecified tangent at c ; see the example above. However when $\langle \text{dir} \rangle_p$ and $\langle \text{dir} \rangle_c$ are parallel there is a whole family⁴ of possible ellipses with the specified tangents.

With no further hint available, a choice is made based on the distance between p and c . If the required direction is perpendicular to \overline{pc} this choice results in a circular arc. The optional factor in $=(\langle \text{num} \rangle)$ is used to alter this choice; the default (1) is assumed when nothing follows the =. This factor is used to “stretch” the ellipse along the specified direction. For a negative $\langle \text{num} \rangle$ the orientation reverses.

```

\xy ;/r5pc/:*+<10.1pt>\dir{*}="p";p*\frm{-}
,*+!UR{p},p+(.5,-.5)*\dir{*}="o",**\dir{-}
,*+!UL{o},+(0,.81)*<8.1pt>\dir{*}="c"
,*\frm{-},*+!DL{c},"c"
,{\ellipse r,={}},{\ellipse r,=(2){.}}
,{\ellipse r,^=(3){.}},{\ellipse r,=(-2){.}}
,{\ellipse r,=(-1){.}}\endxy

```

The final variant uses the directions from p and c to the given $\langle \text{coord} \rangle$. If $\langle \text{orient} \rangle$ is $\langle \text{empty} \rangle$ then the orientation is determined to give the shortest path along the ellipse. Specifying an $\langle \text{orient} \rangle$ of \wedge or $_$ will force the orientation, even if this means travelling ‘the long way’ around the ellipse. For example, see next figure.

Alternative curves In some cases the circular or elliptic curve can be replaced by a curve with different shape, having the same tangent directions at the end-points. When a full circle/ellipse is specified then one gets instead a closed curve constructed from 4 spline segments. Other variants use a single segment, 2 or 3 segments, or some portion of all 4 segments. Possibilities are given in the following table.

$\backslash \text{ellipse} \sim e \dots \{ \dots \}$	elliptical, as above
$\backslash \text{ellipse} \sim q \dots \{ \dots \}$	parabolic segments
$\backslash \text{ellipse} \sim c \dots \{ \dots \}$	cubic segments
$\backslash \text{ellipse} \sim i \dots \{ \dots \}$	interpolating cubic
$\backslash \text{ellipse} \sim p \dots \{ \dots \}$	cuspidal cubic

⁴Indeed this is always so. The algorithm used for the general case tends toward parallel lines—clearly unsuitable.

`\ellipse~c(<num>)\dots{.}` cubic segments,
with “looseness”

In the latter case the $\langle \text{num} \rangle$, typically between 0 and 1, controls how soon the curve begins to bend away from the tangent direction. Smaller values give tighter curves — 0 for straight lines — with $\sim c$ being the same as $\sim c(1)$ and $\sim q$ is $\sim c(.66667)$, that is $\langle \text{num} \rangle = \frac{2}{3}$.

The curve produced by the “interpolating” variant $\sim i$ actually passes through the control point “x”, with slope parallel to the line \overline{pc} . Since the tangents at p and c point toward “x” the curvature is quite gentle until near “x” where the curve bends rapidly, yet smoothly. This is obtained also by using $\sim c(1.33333)$, that is $\langle \text{num} \rangle = \frac{4}{3}$. Since $\langle \text{num} \rangle > 1$ the “convex hull property” does not hold; indeed the curve is entirely outside the convex hull of p , c and “x”, apart from those points themselves.

The ‘cuspidal’ variant $\sim p$ is equivalent to $\sim c(2)$. It exhibits a cusp. For $\langle \text{num} \rangle > 2$ the curve is so “loose” that it exhibits loops. (The author offers no guarantees on the usefulness of such curves for any particular purpose; however they do look nice. ☺)

```
\xy 0;/r6pc/:*+\dir{*}="p",*+!UR{p},"p";
p+ (.5,-.5)*+\dir{*}="c",*+!UL{c}
,"p"+(.825,-.25)="x"*\dir{+},"c"
,{\xycompile{\ellipse"x"{-}}}
,{\xycompile{\ellipse~q"x"^{.}}}
,{\xycompile{\ellipse~c"x"^{.}}}
,{\xycompile{\ellipse~c(.3)"x"^{:}}}
,{\xycompile{\ellipse~c(2.3)"x"{-}}}
,{\xycompile{\ellipse~i"x"^{.}}}
,{\xycompile{\ellipse~p"x"^{-}}}
\endxy
```

Hint: When exploring to find the best location for the “control-point” (e.g. the “x” in the above example), then use `\xycompile` as shown, changing the location outside of the compilation. This speeds up the reprocessing with the changed value.

Furthermore, the ellipses are not true ellipses, but are constructed from four Bézier cubic curves, one for each quadrant of the circle or ellipse. To do this it is sufficient to establish the control points for each cubic segment. This is straightforward, using the following “magic number”, given a square basis such that the desired circle is the unit circle, or rectangular basis for which the “unit circle” is the desired ellipse. Thus $\sim e$ is equivalent to $\sim c(.5517847)$.

```
sss \xydef@{\arcmagic@@{0.5517847}}
sss \xylet@{\arcmagic=@{\arcmagic@@
```

This is the magic number, exactly given by $\frac{1}{12}(\sqrt{385} - 13)$, that helps construct the Bézier cubic curve that best approximates a quarter-turn arc of a circle. It does so with remarkable accuracy, differing by at most .5% of the radius at any angle; the average deviation along the whole quadrant being less than .13%.

```

Avoiding overflows If $\langle \text{dir} \rangle_p$ and $\langle \text{dir} \rangle_c$ are intended to be equal then the method of the previous paragraph should be used. However it may happen that “nearly parallel” directions may be specified, perhaps by accident. There is then the possibility of “numerical overflow” or a “division by zero” error. The latter may be accompanied by a warning message:

```

Xy-pic Warning: division by 0 in
\intersect@, replaced by 50

```

This indicates that the number 50 has been used as the result of a division by zero. In many contexts this will produce an acceptable result. However it may lead to an “overflow” in other situations, or to drawing beyond the normal page boundary. This can be controlled using a $\langle \text{decor} \rangle$ of type $\text{\z@zeroDivideLimit}\langle \text{num} \rangle$, prior to specifying the \ellipse . The value 50 will be replaced by $\langle \text{num} \rangle$ whenever a “division by zero” would otherwise be encountered in an intersection calculation.

```

radius known, end-points unknown

The language for these is a combination of most of that used above, but the interpretation of the \langle direction \rangle s is different...

```

\ellipse<radius><dir>_1,<orient>,<dir>_2{..}
\ellipse<radius><dir>_1,<orient>,<dir>_2{..}

```

where \langle radius \rangle is one of the forms used above to describe a circle or ellipse. Not all of the ellipse will be typeset—only that arc starting with \langle dir \rangle_1 as tangent vector, tracing via \langle orient \rangle until the tangent points in direction \langle dir \rangle_2 . This effectively extends the notation used with `\cir` in 1.6.2. Note that rotating a given \langle dir \rangle_i by 180° specifies a different arc on the same ellipse/circle. Reversing the \langle orient \rangle no longer gives the complementary arc, but this complement rotated 180° .

```

3.10 Knots and Links feature

Vers. 3.8 by Ross Moore <ross.moore@mq.edu.au>

This feature provides a language for specifying knots, links and general arrangements of crossing strings.

```

To Do: Document this feature!

```
43 \message{knots and links,}
```

This `knot` feature is really a ‘construction kit’, providing pieces which may be placed appropriately to form knots and links. The types of pieces provided are of two kinds: the “crossings”, representing one string crossing over or under another; and “joins” which are used to connect what would otherwise be loose ends. Several types of each are provided, along with a simple way of specifying where to place arrowheads and labels.

All the pieces ultimately use curves from the `curve` extension, usually indirectly via the `arrow` feature. As such, processing can be memory-intensive and may seem rather slow. All the warnings and advice given elsewhere on techniques to handle pages and individual diagrams with many curves are especially applicable when using this feature.

Most constructions use `\ar` so make sure this feature is loaded.

```

cinquefoil

Crossings

A “crossing” is intended to represent two strings passing close by, but not meeting. The macros provided specify typesetting within a square cell of coordinate values; using a non-square basis alters this shape, but see also note 3.10c below, for the technique that was used in the “cinquefoil” example above.

Notes

3.10a. Several families of crossing are provided. Those having names as `\v...` and `\h...` are designed to stack respectively vertically and horizontally. More precisely the current $\langle \text{pos} \rangle$ starts at the top-left corner and finishes at either the bottom-left or top-right. Say that a crossing is either a ‘vertical crossing’ or ‘horizontal crossing’ respectively.

This certainly applies to the `\..cross..` and `\..twist..` families, see figure 3.8 in which the strings enter and leave the square all with vertical tangents or all with horizontal tangents. Indeed *all* crossings are either vertical or horizontal, with the final letter indicating which for the `\xover..` families.

Furthermore there is a natural *orientation* for each crossing, as well as along each strand. This corresponds to the order in which ink is applied to the printed page, following the natural parametrization of each strand as a curved connection or arrow. This orientation determines whether a crossing

is ‘over’ (mathematically, positive or right-handed) or ‘under’ (mathematically, negative or left-handed). It is used in determining the location of labels and the direction of arrowheads placed along the strings. Note that `\..cross..` and `\..twist..` crossings may set the same curves, but with different orientation and label-positioning.

Figure 3.8 displays the orientation on all the crossings, grouping them into subfamilies consisting of right-handed, left-handed and non-crossings. Also indicated are the default positions for labels and arrow-tips; each piece uses the same code for tips and labels, e.g. `\vover<>|>>><{x}|{y}>{z}`.

The `\x...` crossings do not stack easily since their tangents are at 45° to the coordinate axes. It is the last letter in the name which denotes whether the particular crossing is vertical or horizontal. On the other hand `\vover`, `\vunder` etc. stack vertically on top of a `\vcross`, `\vtwist` etc.; similarly `\hover` stacks at the left of `\hcross`, `\htwist` etc.

```

$$\xy 0;/r1pc/:
  ,{\vunder\vtwist\vtwist\vunder-}\endxy
\qqquad\qqquad\qqquad \xy 0;/r1pc/:(0,-1.5)
  ,{\hover\hcross\hcross\hover-}\endxy$$

```

3.10b. The above examples also show how to use `-` to get the mirror-image of a particular crossing. Any numerical scale factor can be used by enclosing it within `[.]` e.g. `[2.3]` scaling a single piece without affecting the rest of the picture. The scale-factor *must* occur before any label or arrow-tip specifiers, see below). Vertical crossings remain vertical under scalings; the current `<pos>` still moves by 1 coordinate unit in the ‘down’ direction. Similarly horizontal crossings remain horizontal. The single character `-` is a shorthand version for `[-1]`, effectively giving a half-turn rotation in a rectangular basis.

```

3.10c. A knot-piece need not be rectangular. By specifying $\sim\langle\text{pos}_1\rangle\langle\text{pos}_2\rangle\langle\text{pos}_3\rangle\langle\text{pos}_4\rangle$ the four corners UL, UR, DL, DR are set to the given `<pos>`s respectively. The local basis is established so that

$$\begin{aligned}
 r\text{-hop} &\leftrightarrow \frac{1}{2}(\langle\text{pos}_2\rangle - \langle\text{pos}_1\rangle + \langle\text{pos}_4\rangle - \langle\text{pos}_3\rangle) \\
 u\text{-hop} &\leftrightarrow \frac{1}{2}(\langle\text{pos}_1\rangle - \langle\text{pos}_3\rangle + \langle\text{pos}_2\rangle - \langle\text{pos}_4\rangle) .
 \end{aligned}$$

3.10d. With a non-rectangularly shaped piece it will usually be necessary to adjust the place where the ‘hole’ occurs in the ‘under’ string. This is done by specifying `@(<num>)`, with $0 \leq \langle\text{num}\rangle \leq 1$ being the parameter value of the new location for the hole.

3.10e. The `knot` feature allows for the easy placement of the following objects along the strings of a crossing:

- labels on the strings;
- arrowheads for direction or orientation;
- holes in strings, allowing another string to be drawn passing over.

3.10f. The characters `<`, `>` and `|` are used to indicate to which string portion the object is associated; with `|` denoting the string which crosses the other, while `<` and `>` denote the initial and final portions of the ‘crossed’ string.

```

944 \xydef@\xykprebreak@{%
945 \ifx\xykprebreak@@\empty\addtotoks@{}}\else
946 \expandafter\addtotoks@\expandafter{\expandafter{\xykprebreak@@}}\fi}

952 \xydef@\xykmidbreak@{%
953 \ifx\xykmidbreak@@\empty\addtotoks@{}}\else
954 \expandafter\addtotoks@\expandafter{\expandafter{\xykmidbreak@@}}\fi}

```

3.10g. A simple label enclosed in braces, for example `\vcross>{x}`, is set in math-mode using the `\labelstyle`, at a pre-determined place on the string portion, shifted in either the ‘above’ or ‘below’ direction from the curve at this point. (For each crossing depicted in figure 3.8 only default values are used for the place and shift-direction.)

3.10h. If the first character within the braces `{..}` is `*` e.g. `\htwist>{*⟨object⟩}`, then a general `⟨object⟩` may be placed as a label. Furthermore if the first character is `^` or `_` or `|`, then the interpretation is, e.g. `\vtwist<{^⟨anchor⟩⟨it⟩}`, as in 3.2 to place `⟨it⟩` as a label along an `\ar` of the `arrow` feature.

3.10i. A second character `<` or `>` specifies that an arrowhead should appear at the pre-determined place on the chosen string. Here `>` denotes an arrowhead pointing with the natural orientation, while `<` points against. Due to the curvature of the strings, it is usually best to `\UseComputerModernTips` rather than normal arrow-tips.

3.10j. To generate a ‘hole’ use `\knothole`, or simply `\khole`, as following token. This generates a ‘break’, in the sense of 3.3j. Indeed such a ‘hole’ is used to separate the two portions of the ‘crossed’ string. Default size for the hole is 5pt, which is alterable via `\knotholesize{⟨dimen⟩}`; normally used to set the size for *all* holes in a diagram.

3.10k. If the resulting `\khole` is either too large or perhaps non-existent, this could be due to a technicality in the way breaks in curves are handled. This problem should not occur with the standard crossings, using a rectangular basis, but it may occur with non-rectangular bases. An easy ‘fix’ is to include an extra *null-break* on the string, using `<|`, `>|` or `||`, which should place the zero-sized break at parameter value .5 on the curve. The specification should precede a `\khole` at a higher parameter value, or come after one at a lower value.

The aim of the above ‘fix’ is to position the null-break as close as possible to where the curve is farthest from the line joining its end-points, which is usually at parameter value (.5).

When the next token is a begin-group character { then look at the first token inside the group. If it is ^, _ or | then the group contents will be an <anchor> for user-chosen places along the string. Otherwise the place is taken to be the already specified \xyknotPLACE and the group contains a label, to be set in the usual way for labels, using _ due to the orientation of the curve. However if

the first token is * then the user is assumed to be dropping his own label, possibly with <object> modifiers.

Multiple breaks, arrow-heads and labels may be specified along the two strings of a crossing; simply place their specifications one after another; e.g. <>|>>><{x}|{y}>>{z} was used in figure 3.8.

The only proviso is that all ‘breaks’ along a single strand must occur with increasing order of parameter position. On the ‘crossed’ string this includes the automatic ‘hole’ to create space for the other string. Hence it is advisable to use just the (+..) and (-..) variants for small

adjustments, and to keep these correctly ordered.

```
1135 \xydef@{xykz#1}{\let\xyk@@=#1\xy@{\let\xyk@@=#1}}

Adjustment of position along the strings can be achieved using a $\langle\text{factor}\rangle$, as in $\text{\vover}|(+.1)\rangle$. Allowed syntax is $(\langle\text{sign}\rangle\langle\text{num}\rangle)$ where $\langle\text{sign}\rangle$ is + or - to increment or decrement from the pre-defined value. Also allowable are = or $\langle\text{empty}\rangle$ to set the parameter position to $\langle\text{num}\rangle$, which must lie between 0 and 1 to have any meaning.

This parses adjustments of the \xyknotPLACE .

Arrowheads can also be placed at either, or both, ends of the strings forming a crossing. This is governed by a pair of booleans, initially `{FF}`. It is changed for *all* subsequent strings in a diagram by `\knottips{. .}` where the recognised values are `{FF}`, `{FT}`, `{TF}` and `{TT}`, denoting tips (T) or not (F) at the start and end of each string. To add arrowtips at the start of strings in a particular crossing, append the 2-character combination `=<`; similarly `=>` adds tips at the ends, if not already requested. The combinations `==` and `!=` specify both (`{TT}`) and none (`{FF}`) respectively. These 2-character pairs can be mixed in with any specifications for labels and breaks, etc. Multiple pairs compound their effect; in particular `=<=>` gives the same result as `==`, while `!=<` is needed to change `{FT}` into `{TF}`.

These are best used with single pieces, as in the following equation.

$$\nabla \left[\begin{array}{c} \nearrow \\ \searrow \end{array} \right] - \nabla \left[\begin{array}{c} \nwarrow \\ \swarrow \end{array} \right] = -z \nabla \left[\begin{array}{c} \rightsquigarrow \\ \rightsquigarrow \end{array} \right]$$

```

Joins

3.10l. The “joins” are used to connect the loose ends of crossing strings. In particular “loops” and “caps” are for placing on ends of horizontal or vertical ‘twist’ and ‘cross’ crossings, leaving the current $\langle \text{pos} \rangle$ fixed. The “bends” join non-adjacent crossings of the same type, either horizontal or vertical.

The $\backslash\text{xcap}..$ pieces are designed to join adjacent $\backslash\text{xover}..$ pieces; they move c either vertically or horizontally, as appropriate. Finally the $\backslash\text{xbend}..$ pieces allow for smooth joins of 45° slopes to horizontal or vertical slopes. For these the actual positioning of the piece, see figure 3.9, is not entirely obvious.

Figure 3.9 displays the orientation on the joins. Also indicated are default positions for labels and arrow-tips; each piece uses the same code, e.g. $\backslash\text{vloop} \langle \rangle | \gg \langle \{x\} | \{y\} \rangle \{z\}$. Furthermore the current $\langle \text{pos} \rangle$ before the piece is drawn is marked using $^\circ$; that afterwards is indicated by \times or $+$.

The ability to scale in size and place arrow-tips, breaks, labels etc. apply also to $\langle \text{join} \rangle$ pieces. The only difference is...

3.10m. The three places referred to by $\langle , | , \rangle$ are all on a single string. In particular $|$ is always at the middle of the $\langle \text{join} \rangle$, whereas \langle and \rangle are at *earlier* and *later* parameter values respectively. Any adjustments^{3.10k} involving breaks should occur in increasing parameter order.

```

3.10n. A parameter can be altered, using @⟨adjust⟩, to effect subtle adjustments to the shape of any join. Within a rectangular basis the horizontal or vertical tangents are preserved and overall reflection or rotation symmetry is preserved. Thus this parameter affects the ‘flatness’ of a cap or loop, or the amount of curvature in s-bends and z-bends. For \xcap..s and \xbend..s the 45° angle is altered; this is especially useful to match the tangents when a knot-piece has been specified using the technique of note 3.10c.

The normal range for these parameters is between 0 and 1. Other values can be used with interesting results—the parameter determines the location of control points for a Bézier cubic curve.

piece	value	effect on...
\..cap	.25	flatness of cap;
\..loop	.75	flatness of loop;
\sbend..	.75	curvature in the ‘s’;
\zbend..	.75	curvature in the ‘z’;
\xcap..	.5	height of cap, slope at base;
\xbend..	.5	curvature, slope at base.

The following example gives three ways of specifying a ‘trefoil’ knot, using the poly feature to establish the location of the vertices for knot-pieces. In each the ⟨crossing⟩s are calculated to fit together smoothly; a different way of creating ⟨join⟩s is used in each. Also the third displays subtle changes of the 3.10njoin control.

```

Changing the string-style

It is not necessary to use solid curves; any style available to curves and arrows can be chosen using...

<code>\knotstyle{<char>}</code>	use <code>\dir{<char>}</code>
<code>\knotstyles{<char>}{<char>}</code>	two styles
<code>\knotSTYLE{<code>}</code>	use <code><code></code>

In each case the new style applies to *all* subsequent knot pieces, except that the two styles apply only to crossings. The latter case allows use of object `<modifier>`s. The `<code>` consists of two groups `{. .}{. .}`, each containing `<arrow>` forms, as in 3.2 and notes 3.3m, 3.3r. Only the first `<arrow>` form is used with `<join>`s whereas the two forms are used respectively with the two strings of a `<crossing>` in the order that they are drawn.

```

This extends the ‘arrow’ feature, which is therefore required, with a “smart” \langle path \rangle between two \langle pos \rangle itions.

```
41 \xyrequire{arrow}\xycatcodes
```

The \langle turn \rangle syntax is extended with the construction

$$\langle \text{turn} \rangle \longrightarrow 's \langle \text{diag} \rangle - \langle \text{diag} \rangle \langle \text{turnradius} \rangle$$

$\varin_{out}/5pt$ which draws a connector leaving p in the in \langle diag \rangle onal direction and arrives at c in the out \langle diag \rangle onal direction, using $5pt$ turns. The connector contains only horizontal or vertical lines and $\frac{1}{8}$ sectors of circles of the given (optional) \langle turnradius \rangle .

Bug: Any labels are placed at the end of the connection.

The smart connection algorithm is as follows:

A smart connector consists only of horizontal and vertical straight segments connected with $1/4$ circles. $1/8$ circles might be use at the start and end of the connector to reach a horizontal or a vertical.

All possible connectors can be reduced to a series of equivalence classes, where two connectors are considered equivalent if they are identical after removing from each of them all the horizontal and vertical straight segments. Such a connector is called a representative.

The algorithm first computes 10 representatives that start and end in the given directions and have at most one point where the orientation is changed. 5 of the representatives start counter-clockwise and the other 5 start clockwise. Among the counter-clockwise representatives, 1 does not have any change in orientation (one arc of circle starting and ending in the given directions). The other 4 are obtained by changing the orientation in the four points where the circle is tangent to a horizontal or a vertical.

For each representative the algorithm determines if it can be extended with horizontal and vertical segments to reach the destination point when starting in the source point (the directions are already right by construction). For example, horizontal straight lines could be inserted in all the points where the representative is tangent to a horizontal line. In each such point a straight line segment can be inserted to extend the connector horizontally but only in the same direction of the connector at that point (the direction of the connector in a point is towards the destination). For example, if the horizontal distance between the source and destination points is D_x and the horizontal distance between the start and the end of the representative connector is dx then the distance “ $D_x - dx$ ” must be covered using horizontal straight lines. This distance is distributed equally among all the horizontal extension points of the right direction. If no such points exist, then the representative is discarded. The cost of a connector is the length of the representative plus the total length of straight extension segments, i.e., $D_x - dx + D_y - dy$.

The algorithm selects among all the representatives that are not discarded, the one leading to the shortest connection.

```

Chapter 4

Drivers

This chapter describes the driver options that support customisation of the Xy-pic output to particular output devices. The first section describes the actual drivers, the second a set of modifications specially applicable to POSTSCRIPT printing.

4.1 Support for Specific Drivers

4.2 dvidrv driver

Vers. 3.6 by Ross Moore <ross.moore@mq.edu.au>

This driver provides support for the “emtex” `\special` commands, when using one of the standard dvi-drivers: `dvidot`, `dvihplj`, `dvimsp`, `dviscr` or `dvivik`, that come with Eberhard Mattes’ em-TeX distribution.

4.3 DVIPS driver

Vers. 3.8 by Ross Moore <ross.moore@mq.edu.au>

This driver provides support for *all extensions* when using the DVIPS driver by Tomas Rokicki [12]. It has been tested with dvips version 5.55a and dvipsk version 5.58f.

```

All the POSTSCRIPT definitions passed to `dvips` by reading the dictionary file are stored in a POSTSCRIPT dictionary which it defines, called `SDict`. This must be the current dictionary whenever an `Xy-ps` command is to be executed. This will be the case whenever the `\special{" commands}` or `\special{! commands}` forms are used, but not when the `\special{ps:: commands}` form is used. Thus the `\dvipsSpecial@` macro includes code to open `SDict` and close it when finished; so also does the `\dvipsRaw@` type, since this is used with `Xy-pic` POSTSCRIPT operators

whose definitions have been placed within `SDict`.

The `currentpoint` is defined for the “raw” specials.

```
199 \xydef@dvinfosCurrpt@{\let\xyPScurrpt@=\dvinfosCurrpt@}%
200 \xydef@dvinfosCurrpt@{\PSraw@{xyp}}
```

The POSTSCRIPT operator called `xyp` is defined in `xyps-ps` for storing the location read from `currentpoint`.

This installs the POSTSCRIPT backend.

```

4.4 DVITOPS driver

Vers. 3.6 by Ross Moore <ross.moore@mq.edu.au>

This file provides support for the DVITOPS driver by James Clark. As of September 1995, it has not been fully tested.

Header:

Supported \special effects are...

- colour, using direct color specials for `gray`, `rgb` and `hsb` colour models; and POSTSCRIPT colour within diagrams;

DVITOPS has a method for using colours locally, however it only colours “regions”, which cannot be nested. To use this within Xy-pic diagrams would be just asking for trouble.

4.5 OzTeX driver

Vers. 3.6 by Ross Moore <ross.moore@mq.edu.au>

This driver provides the necessary interface to support the POSTSCRIPT back-end and other POSTSCRIPT effects when using the DVI driver of versions 1.8+ of OzTeX by Andrew Trevorrow,¹ *Earlier versions of OzTeX should instead use the driver option \xyoption{17oztex}.*

Effects such as colour, line-thickness and rotated or scaled diagrams are only partially supported in that the effects cannot be applied to any text or symbols placed using fonts. This is due to the nature of OzTeX <driver>, whose optimization of the placement of font-characters precludes the applicability of such effects. Furthermore the POSTSCRIPT dictionary must be available in a file called `global.ps` or

¹OzTeX is a shareware implementation of TeX for Macintosh available from many bulletin boards and ftp sites; v1.5 and earlier versions were freeware. Email contact: <akt@kagi.com>.

appended to the `OzTeXdict.pro`. However with version 1.8 and later of `OzTeX`, there is the alternative of using the `dvips` (driver), which does support all the `POSTSCRIPT` effects available in `Xy-pic`.

Note: To use `Xy-pic` effectively with `OzTeX` requires changing several memory parameters. In particular a ‘`Big-TeX`’ is needed, along with an increase in the `pool_size` parameter. Explicit instructions are contained in the file `INSTALL.OzTeX` of the `Xy-pic` distribution.

157 {\catcode'\^M=\active %
158 \gdef\next{\catcode'\^M=\active \let^M=\space \obeyspaces}}
159 \xylet@\obeyOzTeXlines@=\next

```

The POSTSCRIPT operators @bxy and @exy are defined in xyps-ps for bypassing the mechanism used in OzTeX to isolate code passed in \special commands. Although it is possible (albeit difficult) to devise POSTSCRIPT to deduce the current location for use with the “raw” specials, this information cannot be used to do rotations and scaling as with other (driver)s. Hence the value of \xyPScurrpt@@ is taken to be empty.

```

170 \xydef@\OzTeXCurrpt@{\let\xyPScurrpt@@=\OzTeXCurrpt@@}%
171 \xydef@\OzTeXCurrpt@@{\PSraw@@{xyp}}

```

This avoids dumping the dictionary into the dvi-file, making sure that instead it goes into a file, specified by \xyPSdictname, which defaults to global.ps.

```

181 \xydef@\oztexPS@{\OzTeXPStypes@
182 \let\oztexPS@@=\relax
183 \let\UnloadPS@@=\oztexPSunload@
184 \let\installxyps@@=\@OzTeX@PS@

4.6 OzTeX v1.7 driver

Vers. 3.7 by Ross Moore <ross.moore@mq.edu.au>

This option provides the necessary interface to support the POSTSCRIPT back-end and other POSTSCRIPT effects when using the DVI driver of version 1.7 of OzTeX by Andrew Trevorrow,² *Later versions of OzTeX should instead use the driver option \xyoption{oztex}*. Upgrading to version 1.9+ of OzTeX is recommended.

Does not support rotations, scaling and coloured text within diagrams and the POSTSCRIPT dictionary must be available in a file called `global.ps`.

Note: To use Xy-pic effectively with OzTeX requires changing several memory parameters. In particular a 'Big-TeX' is needed, along with an increase in the `pool_size` parameter. Explicit instructions are contained in the file `INSTALL.OzTeX` of the Xy-pic distribution.

```

The POSTSCRIPT operators @boxy and @eoxy are defined in xyps-ps for bypassing the mechanism used in OzTEX to isolate code passed in \special commands. Although it is possible (albeit difficult) to devise POSTSCRIPT to deduce the current location for use with the “raw” specials, this information cannot be used to do rotations and scaling as with other <driver>s. Hence the value of \xyPScurrpt@@ is taken to be empty.

```

4.7 Textures driver

Vers. 3.6 by Ross Moore <ross.moore@mq.edu.au>

This driver provides support for version 1.7+ of Blue Sky Research's TEXTURES application for Macintosh³. It incorporates support for colour and all of Xy-pic's POSTSCRIPT effects. Earlier versions of TEXTURES should instead use the driver option `\xyoption{16textures}`.

Notice that version 1.7 suffers from a printing bug which may cause a POSTSCRIPT error. A fix is kludged by making sure the first page has been shown in the viewer before any pages with diagrams are sent to the printer.

Versions 1.7 and later of TEXTURES have the following kinds of \special, the first two executing in the environment defined by the dictionary `userdict`. In particular these versions of TEXTURES now allow the POSTSCRIPT dictionary to be loaded into the main working dictionary.

– \special{rawpostscript #1} puts code directly into the POSTSCRIPT file.

- `\special{postscript #1}` wraps the code within `sps...eps`, which involves a basis change within a `save/restore` pair.
- `\special{prePostScript #1}` places the POSTSCRIPT code within the header dictionary, called `TeXdict`.

Each of these has a corresponding version for reading the POSTSCRIPT commands from a file.

4.8 Textures v1.6 driver

Vers. 3.6 by Ross Moore <ross.moore@mq.edu.au>

This driver provides support for versions 1.5b and 1.6 of Blue Sky Research's TEXTURES application for Macintosh⁴. It incorporates support for POSTSCRIPT colour and the Xy-ps POSTSCRIPT back-end. This will *not* work with versions 1.7 and later; these require the <driver> option \xyoption{textures}.

119 \let\UnloadPS@=\UnloadPS@
120 \let\oldtexturesPS@=\oldtexturesPS@ }
```

We must return the binding of `\shipout` to its initial value.

Early versions (1.5–1.6) of TEXTURES have two kinds of `\special`, for inserting POSTSCRIPT code into the dvi-file and two more for reading such code from a file:

- `\special{rawpostscript #1}` puts code directly into the POSTSCRIPT file.
- `\special{postscript #1}` wraps the code within `sps...eps`, which involves graphics state changes within a `gsave/grestore` pair.

Each of these has a corresponding version for reading the POSTSCRIPT commands from a file.

```
142 \xydef@oldTexturesSpecial@#1{\firstPS@special{postscript #1}}
143 \xydef@oldTexturesMacro@#1{\special{postscript {#1}xy}}

163 \gdef\next{\catcode'\^M=\active \let^M=\par \obeyspaces}}
164 \xylet\obeyoldTextureslines@=\next
```

The `currentpoint` is defined for the “raw” specials. For Textures this is the same as `\xyPScurrpt@@@`, in `xyps-ps.doc`.

```

171 \xydef\oldtexturesCurrpt@{\let\xyPScurrpt@=\oldtexturesCurrpt@}%
172 \xydef\oldtexturesCurrpt@{\PSspecial@{xyi}\PSraw@{userdict begin xyx end}}

```

The POSTSCRIPT operator called `xyx` is defined in `xyps-ps` for storing the location placed on the stack by `xyi`.

TEXTURES v1.6 requires the POSTSCRIPT dictionary to be shipped-out with every page. To achieve this efficiently we rebind `\shipout`, as described in `xyps-ps.doc`. Next set the flag `\UsePSdict@true` after having rebound `\includePSmessage@` to gobble the attempt to load the dictionary directly into the dvi-file.

This installs the POSTSCRIPT backend.

```

4.9 XDVI driver

Vers. 3.6 by Ross Moore <ross.moore@mq.edu.au>

This driver provides support for extensions when using variants of the `xdvi` driver, by Eric Cooper, Bob Scheifler, Mark Eichin and others. It has been used successfully with `xdvi` patchlevel 20, by Paul Vojta, and `xdvik` version 18f, by Karl Berry.

Some of the supported features assume that the implementation of `xdvi` is linked to a POSTSCRIPT renderer; e.g. *Ghostsript* or DISPLAY POSTSCRIPT. If such support is not available, then invoking `xdvi` using the command `xdvi -hushspecials` will suppress warning messages that might otherwise

be produced. One drawback of such a setup is that much of the POSTSCRIPT is not rendered until after all of the font characters, etc. have been placed on the page. Thus text that was meant to be placed on top of a filled or patterned region may appear to be obscured by it. However when printed, using a POSTSCRIPT printer, the correct placement is obtained.

Driver installation Supported \special effects are...

- colour, using POSTSCRIPT.

Not all versions of `xdvi` support color `\specials`, so there is no direct support for colour. However parts of pictures rendered using `POSTSCRIPT` may appear coloured, due to interpretation of colour commands within the `POSTSCRIPT`.

Disable the `\xylocalColor@` but enable the `\xycolor@` for use by `POSTSCRIPT`.

```

86 \xydef@\xdvi@Color@\xdviPStypes@
87 \let\xylocalColor@=\xyNoColor@@
88 % \let\xylocalColor@=\xystackcolor@

107 \let\xycolorwarning@=\xycolorwarning@@
108 \let\xdviColor@@=\xdvi@Color@
109 \let\UnloadColor@@=\UnloadColor@
110 }

```

If neither support file `colordvi.tex` nor `colordvi.sty` can be found, then the normal colour support will not be available. However the colour support for the `POSTSCRIPT` back-end can still be used.

```

118 \xydef@\NoXDVIcolordvi@\xywarning@{%
119 Neither colordvi.tex nor colordvi.sty could be found.}%
120 \xyBEcolorcheck@}%

```

- crayon colours.

The 68 colours that `xdvi` recognizes by name are not loaded unless the `crayon` option has been requested.

```

133 \xydef@\xdviCrayola@@@\xdviColor@@@\xdviCrayola@}
135 \xydef@\xdviCrayola@{%
136 \let\prevxycolor@=\newxycolor@
137 \def\newxyXDVIcolor@##1##2##3{\prevxycolor@{##1}{}{##1}}%
138 \let\newxycolor@=\newxyXDVIcolor@
139 \installCrayolaColors@
140 \let\newxycolor@=\prevxycolor@ }%

```

Although any order of loading options: `ps`, `xdvi`, `color` and `crayon` produces the desired result visually, the `POSTSCRIPT` code can be different with different loading order. The most easily

readable is obtained when `crayon` is requested last.

- POSTSCRIPT back-end.

```

193 \gdef\next{\catcode'\^^M=\active \let^^M=\space }}%
194 \xylet@\obeyXDVIlines@=\next
```

All the POSTSCRIPT definitions passed to `xdvi` by reading the dictionary file are stored in a POSTSCRIPT dictionary which it defines, called `SDict`. This must be the current dictionary whenever an `Xy-ps` command is to be executed. This will be the case whenever the `\special{" commands}` or `\special{! commands}` forms are used, but not when the `\special{ps:: commands}` form is used. Thus the `\xdviSpecial@` macro includes code to open `SDict` and close it when finished; so also does the `\xdviRaw@` type, since this is used with `Xy-pic` POSTSCRIPT operators whose definitions have been placed within `SDict`.

The `currentpoint` is defined for the “raw” specials.

```
212 \xydef@\xdviCurrpt@{\let\xyPScurrpt@@=\xdviCurrpt@@}%
```

```
213 \xydef@\xdviCurrpt@{\PSraw@{xyp}}
```

The POSTSCRIPT operator called `xyp` is defined in `xyps-ps` for storing the location read from `currentpoint`.

This installs the POSTSCRIPT backend.

4.10 PDF driver

Vers. 1.6 by Daniel Müllner (<http://math.stanford.edu/~muellner>)

The PDF support is documented separately in the `xypdf.pdf` document, typeset by running \LaTeX on `xypdf.dtx`.

4.11 Extra features with POSTSCRIPT support

4.11.1 xyps-ps.doc

The included file `xyps-ps.tex` (version 3.11) provides support for POSTSCRIPT `\special` commands used by the `ps` backend extension as well as POSTSCRIPT-based options, to produce special effects not available directly with `TEX`.

Header:

POSTSCRIPT `\special` **commands** The POSTSCRIPT `\specials` which are used by `Xy-ps` fall into four broad classes:

1. execute a piece of code, e.g. to draw some graphic object;
2. add a new POSTSCRIPT definition to the existing dictionary of commands;
3. change the value of some parameters, storing them for later use; and
4. read POSTSCRIPT commands from a pre-existing file.

Since different drivers may provide different syntax for these classes of command, X_Y-ps has different macros to optimize to interface to the different drivers. Initially these control-sequence names are bound to macros that do nothing. Upon specifying a driver, they will be bound to a macro appropriate for that driver.

95 \ifx\undefined\dvitype@\xydef@\dvitype@{null}\fi

```

Some drivers, in particular versions of TEXTURES earlier than 1.7, require the POSTSCRIPT dictionary to be included with every page shipped out. We do this by providing a routine which rebinds the `\shipout` primitive to a macro `\xyPSshipout@` which prepends the X_Y-ps POSTSCRIPT dictionary to the box being shipped-out. This routine `\@PSshipout` is called, if necessary, when the driver has been specified.

```

108 \xylet@\xyrealshipout@=\shipout
109 \xydef@\xyPSshipout@{\setbox9=\copy\voidb@x
110 \afterassignment\xyPSshipout@i\setbox9=}
111 \xydef@\xyPSshipout@i{\ifvoid9 \expandafter\aftergroup\fi\xyPSshipout@ii}
112 \xydef@\xyPSshipout@ii{\xyrealshipout@\vbox{\XYpredict@@\box9}}
114 \xydef@\@PSshipout{\global\let\shipout=\xyPSshipout@ }

```

The box register `\box9` is assumed to be a scratch register, used globally according to T_EX conventions.

When the POSTSCRIPT backend is loaded then we need to rebind `\shipout` to include the full dictionary.

```

124 \xydef@\xyPSshipout@PSii{%

```

```

125 \ifUsePSdict@@\let\XYshipdict@=\includeXYPSdict@@
126 \else\def\XYshipdict@{\XYpredict@@\XYdict@@}\fi
127 \xyrealshipout@\vbox{\XYshipdict@\box9}}

```

These two control sequences are used in the DVI-driver files to control when the POSTSCRIPT `<driver>` can be altered.

```

136 \xydef@\firstPS@{\%fixedxydriver@
137 \global\let\firstPS@@=\relax \global\let\firstPS@=\relax}
138 \xylet@\firstPS@@=\firstPS@

```

4.11.2 Installation

To install use of POSTSCRIPT requires loading the POSTSCRIPT dictionary. However this can only be done when a `<driver>` is known to be able to support it. Hence the `\installxyps@` command should be called only from within a `<driver>`-file.

Furthermore, the `<driver>`-file should define a value for `\installxyps@@` to including anything specific to that `<driver>`; even if only `\let\installxyps@@=\relax`. If `\dumpPSdict` has been specified, then the dictionary must be written first, so it can be used with the subsequent processing (see the subsection below).

```

157 \ifx\undefined\dumpPSdict@@ \xylet@\dumpPSdict@@=\relax \fi
159 \xydef@\installxyps@{\%
160 \xyinputorelse@{xyps-ps}{\xydrivernoload@{ps-ps}}\xycatcodes
161 \installxyps@@ \installxyps@x }
163 \xylet@\installxyps@@=\relax
164 \xylet@\setupxyPS@@=\relax
165 \xywithoption{ps}{\let\setupxyPS@@=\setupxyPS@}
167 \xydef@\installxyps@x{\dumpPSdict@@
168 \ifx\xyrealshipout@\undefined \let\xyrealshipout@=\shipout\fi
169 \ifx \shipout \xyrealshipout@
170 \ifUsePSdict@@ \DN@{\includePSmessage@\includeXYPSdict@\message{>}}%
171 \else \DN@{\XYdict@\endXYdict@}\fi
172 \else \DN@{\let\xyPSshipout@ii=\xyPSshipout@PSii \@PSshipout}\fi
173 \let\firstPS@=\relax \next@
174 \let\XYpredict@=\relax
175 \setupxyPS@@ }
177 \let\realinstallxyps@x=\installxyps@x
178 \ifx\undefined\AfterBeginDocument
179 \def\installxyps@x{\xysetup@@{\realinstallxyps@x}}%
180 \else
181 \def\installxyps@x{\AfterBeginDocument{\realinstallxyps@x}}%
182 \fi

```

In case no `<driver>` was known when a call to the `\installxyps@` method was queued, e.g. by `\dumpPSdict{}` before any `\xyoption{<driver>}`, then a check is made to see there is now a known `<driver>` which supports POSTSCRIPT. If so then this installation is cancelled since another should follow, otherwise the default `<driver>` of `dvips` is assumed. The command `\xyPSdriver#1` is provided to allow users to change this default `<driver>`. This may be necessary when multiple `<driver>`s are required and the final one specified does not support POSTSCRIPT.

```

195 \xydef@\xydefaultdriver@{dvips}
196 \xydef@\xyPSdriver#1{\def\xydefaultdriver@{#1}}
198 \xydef@\installxyps@orig{\DN@{}}%

205 \else \DN@##1{\fi\fi \next@ }
207 %\xylet@\installxyps@@=\installxyps@orig
209 \xydef@\defaultinstallps@#1#2{%
210 \xywarning@{no driver specified, using #1 }%
211 \xyrequire{#1}\csname #1@xy@ps\endcsname{}}
213 \xydef@\null@xy@ps{\installxyps@}

```

POSTSCRIPT escape

An extra \langle shape \rangle modifier key allows arbitrary POSTSCRIPT code to be applied to the current \langle object \rangle .

[! \langle postscript code \rangle]	for special effects
[psxy]	stores current location.

```

230 \xydefcsname@{shape [!...]}#1{\tracingall%
231 \expandafter\ifx\csname xyps-sloaded\endcsname\empty \DN@\{xyPSescapestyle@{#1}@@}%
232 \else\ifxyPSshapes@\DN@\{xyPSshapechar@{#1}@@}%
233 \else \DN@\{xyPScharwarning@\}\fi\fi \next@ }
234 \xydefcsname@{shape [psxy]}\{ifxyPSshapes@\DN@\{xyPSpsxy@}%
235 \else \DN@\{xyPScharwarning@\}\fi \next@ }

```

Normally the \langle postscript code \rangle will be a simple command to alter the POSTSCRIPT graphics state: e.g. [$!1\ 0\ 0\ \text{setrgbcolor}$] changes the colour used to render parts of the \langle object \rangle . Any number of such \langle shape \rangle modifiers is allowable, however it is more efficient to combine them into a single modifier, whenever possible.

It is very important that braces { and } do not appear explicitly in any \langle postscript code \rangle , as this may upset the X_Y-pic \langle object \rangle parsing. However it is acceptable to have a control sequence name here, expanding into more intricate POSTSCRIPT code. This will not be expanded until a later (safe) time.

Due to differences within the DVI-drivers, such simple POSTSCRIPT commands need not affect every part of an \langle object \rangle . In particular the lines, curves and arrowheads generated by X_Y-pic use a different mechanism, which should give the same result with all drivers. This involves redefining some POSTSCRIPT procedures which are always read prior to rendering one of these objects. One simple way to specify a red line is as follows; the `xycolor` extension provides more sophisticated support for colour. The \langle shape \rangle modifiers described in the previous section also use this mechanism, so should work correctly with all drivers.

```

\def\colorxy(#1){%
  /xycolor{#1 setrgbcolor}def}
...
\connect[!\colorxy(1 0 0)]\dir{-}

```

...

Note how the braces are inserted within the expansion of the control sequence `\colorxy`, which happens after parsing of the `<connection>`. The following table shows which graphics parameters are treated in this way, their default settings, and the type of POSTSCRIPT code needed to change them.

colour	<code>/xycolor{0 setgray}def</code>
line-width	<code>/xywidth{.4 setlinewidth}def</code>
dashing	<code>/xydash{[] 0 setdash}def</code>
line-cap	<code>/xycap{1 setlinecap}def</code>
line-join	<code>/xyjoin{1 setlinejoin}def</code>

This feature is meant primarily for modifying the rendering of objects specified in T_EX and X_Y-pic, not for drawing new objects within POSTSCRIPT. No guarantee can be given of the current location, or scale, which may be different with different drivers. However a good POSTSCRIPT programmer will be able to overcome such difficulties and do much more. To aid in this the special modifier `[psxy]` is provided to record the location where the reference point of the current `<object>` will be placed. Its coordinates are stored with keys `xyXpos` and `xyYpos`.

When the `\special` is placed the following registers contain important values: `\L@p` = horizontal displacement of X_Y-pic reference point from the T_EX reference point (i.e. left-hand end of the box) of the initial object; `\D@p` = vertical displacement of X_Y-pic reference point from the T_EX reference point (i.e. the baseline) of the initial object; `\R@p` = horizontal offset, resulting from `<shape>` modifiers; `\U@p` = vertical offset, initially `-\D@p` but alterable by `<shape>` modifiers.

```

319 \xydef@xyPSpsxy@{%
320   \setboxz@h{\dimen@=\L@p \advance\dimen@-\R@p
321   \dimen@ii=-\U@p \raise\dimen@ii\hbox to\z@{%
322     \kern\dimen@\xyPScurrpt@\kern-\dimen@}\boxz@}}%
324 \xydef@xyPScurrpt@{\ifxyPSShapes@expandafter\xyPScurrpt@@\fi}

```

It is necessary to know the current POSTSCRIPT location. Unfortunately the `currentpoint` operator frequently has no value. The following code overcomes this difficulty.

Some drivers may need to define this differently...

```

334 \xydef@xyPScurrpt@@@{\PSSpecial@@{xyi}\PSraw@@{userdict begin xyx end}}
335 \ifx\undefined\xyPScurrpt@@ \xylet@\xyPScurrpt@@=\xyPScurrpt@@@ \fi
337 %\xydef@xyPScurrpt@@@{\PSSpecial@@{userdict begin
338 % 0 0 transform grestore gsave itransform
339 % /xyYpos exch def /xyXpos exch def end}}
341 %\xydef@xyPScurrpt@@@{%
342 % \PSSpecial@@{0 0 transform grestore gsave itransform }%
343 % \PSraw@@{userdict begin /xyYpos exch def /xyXpos exch def end}}

```

The POSTSCRIPT operator called `xyx` is defined below, for storing the location placed on the stack by `xyi`.

Technical Note

: The scoping is achieved by using two `\specials` so that the resulting POSTSCRIPT file should ultimately look like:

```
... { special code before} <object> {special code after} ...
```

The “code after” is to cancel the effect, returning the graphics state to what it was prior to the “code before”. Not all DVI-drivers can achieve this sequencing. In particular $\text{Oz}\text{T}\text{E}\text{X}$ collects all `\specials` in the DVI-file and places their contents at the beginning of the POSTSCRIPT file: any effect would be cancelled immediately after it has been established.

The user can add code to both parts by expressing the `<shape>` modifier as follows:

```
*...!<code before><><code after>]... .
```

Further Technical Note

: The “code before” does two things in addition to that code given explicitly by the user. Firstly it issues a `gsave` then it opens a new dictionary on the dictionary stack. The “code after” contains the matching `grestore` after closing the new dictionary.

Since objects can be built as `\composites` and diagrams can be nested, there is the possibility of generating long chains of nested POSTSCRIPT dictionaries. For this reason the dictionary is kept small, allowing only 8 key-value pairs to be defined within it. If more are required, the user should define a private dictionary to hold the extra key-value pairs, making sure that it is open when its entries need to be accessed.

```

```

Within the expansion of `\XYdict@` the end-of-line tokens are still active. The following expansion seems to work on all systems so far tested.

```

565 \xywarnifdefined\obeyoutlines@
566 {\catcode'\^^M=\active%
567 \gdef\obeyoutlines@{\catcode'\^^M=\active \def^^M{^^J}%
568 \newlinechar='\^^J\obeyspaces}}
```

The dictionary of POSTSCRIPT commands is split into two pieces according to whether they are relevant to general POSTSCRIPT effects or only to the POSTSCRIPT backend. These pieces are generated from code within the files `xyps-pro.tex` and `xypsdict.tex`. These files have corresponding `.doc` versions for documentation.

The following commands cause the parts of the POSTSCRIPT dictionary to be read from the appropriate files. If `\ifUsePSdict@@` gives `\iftrue` then there may be no need to do anything, since the definitions will be subsequently loaded from the header file. Normally it is only necessary to read these files once, using `\XYpredict@`. However some (driver)s may need it more frequently, so instead call `\XYpredict@@` directly.

```

587 \xydef@\XYpredict@@{\ifUsePSdict@@\DN@{\}\else
588 \DN@{\xy@begindvi{\xyinputorelse@{xyps-pro}}%
589 {\xyerror@{Could not load xyps-pro}{}}\xyuncatcodes}}%
590 \next@
591 \DN@{\xy@begindvi{\xyinputorelse@{xypspatt}}%
592 {\xyerror@{Could not load xypspatt}{}}\xyuncatcodes}}\fi
593 \next@ }

595 \xydef@\XYpredict@r{\XYpredict@@ \let\XYpredict@=\relax \installxyps@}
596 \xylet@\XYpredict@\XYpredict@r

598 \xydef@\XYdict@{\XYdict@@\def\XYdict@{\message{PS relaxed}}}%
599 \xydef@\XYdict@@{\DN@{\xyinputorelse@{xypsdict}}%
600 {\xyerror@{Could not load xypsdict}{}}\xyuncatcodes}%
601 \expandafter\xy@begindvi\expandafter{\next@}}
```

This command is for use in macro-packages, providing an easy way to force the dictionary to load, when it has not done so using the usual mechanisms.

```

611
612 \xydef@\forceload@XYdict{%
613 \let\includeXYPsdict@=\includeXYPsdict@r
614 \let\XYpredict@=\XYpredict@r
615 \let\XYdict@=\XYdict@@ \expandafter\installxyps@ }
```

4.11.3 Extensions

Several included files handle standard POSTSCRIPT implementations of X_y-pic extensions.

A conditional `\ifxyPSShapes@` is used to indicate whether the special shape effects implemented in `xyps-r.tex` can actually be fully supported by the current driver. When not available, then an attempt to use these effects simply results in a warning message. After two attempts the warning message “turns itself off”; subsequent attempts are simply ignored cleanly.

```
635 \xynew@if\ifxyPSShapes@ \xyPSShapes@true
637 \xydef@xyPSScharwarning@{\xyPSScharmessage@
638 \gdef\xyPSScharwarning@{\xyPSScharmessage@
639 \xywarning@{...no further PostScript warnings will be given}%
640 \global\let\xyPSScharwarning@=\relax }}
642 \xydef@xyPSScharmessage@{\xywarning@{
643 the current <driver> does not fully support PostScript effects}}%
```

Allow new POSTSCRIPT effects to be defined. This section describes how `\newxyPSshape` is used to define a new effect which is available only in POSTSCRIPT; *i.e.* having no analogue elsewhere within X_y-pic.

The new effect will be called via `[(name)]`, which gets interpreted as referring to `\csname xyshape@(name)\endcsname`. Hence a control sequence of this form must first be created, if it does not already exist. Its initial expansion is simply `\xyundefinedEffect@{(name)}{}@` which produces a warning message.

```
660 \xydef@newxyshape#1#2#3{%
661 \DN@{#3}\ifx\next@empty
662 \xydefcsname@{shape [#1]}\csname xyshape@#1\endcsname}%
663 \else \expandafter\def\csname shape [#1]\endcsname{%
664 \csname xyshape@#1\endcsname}\fi
665 \DN@{#2}\ifx\next@empty
666 \expandafter\def\csname xyshape@#1\endcsname{%
667 \xyundefinedEffect@{#1}{}@}%
668 \else \expandafter\def\csname xyshape@#1\endcsname{#2}\fi }
670 \xydef@xyundefinedEffect@#1#2@{%
671 \xywarning@{The #1 #2 effect is not implemented with the current driver}}%
```

When an implementation of the effect is available then `\csname xyshape@(name)\endcsname` is rebound to `\csname xyPSShape@(name)\endcsname`, which expands to the contents of #2 in `\newxyPSshape#1#2`. If #2 is empty then the expansion is the `\xyPSnotimplemented@'(name)'` warning message, which is especially useful during development.

```
682 \xydef@newxyPSShape#1#2{%
683 \expandafter\DN@\expandafter{\csname shape [#1]\endcsname}%
684 \DNii@{\relax}\ifx\next@\nextii@ \newxyshape{#1}{}\relax\fi
685 \expandafter\DNii@\expandafter{\csname xyPSShape@#1\endcsname}%
686 \expandafter\def\nextii@{#2}%
687 \ifx\nextii@empty\expandafter\def\next@{\xyPSnotimplemented@'#1'@}%
688 \else
689 \edef\tmp@{\noexpand\let\expandafter\noexpand\next@
690 \expandafter\noexpand\nextii@}%
691 \expandafter\tmp@\fi }
693 \xydef@xyPSnotimplemented@#1@{%
```

```

694 \xywarning@{This PostScript effect is not implemented yet}}%
696 \xydef@\xyPSnotfinished@@{%
697 \xywarning@{This effect is not reliable yet; box sizes may be wrong}}%

```

```

4.11.5 Colour

The included file `xyps-c.tex` (version 3.10) provides POSTSCRIPT support for the effects defined in the `color` extension in §2.6.

The POSTSCRIPT style methods are required, so ensure that they are loaded.

```

48 \expandafter\ifx \csname xyps-sloaded\endcsname\empty\else
49 \xyinputorelse@{xyps-s}{\xyerror@{Could not load xyps-s}{}}%
50 \xycatcodes\fi

```

This file is loaded and its effects are activated automatically whenever `\xyoption{color}` is requested and the current `(driver)` supports colours using POSTSCRIPT. Should there be any need to turn off this support, the following commands are available; they obey usual T_EX groupings.

```

\NoPScolor  remove POSTSCRIPT support
\UsePScolor  reinstate POSTSCRIPT.

```

Without POSTSCRIPT support some drivers may still be able to provide some support for colours. These commands are not guaranteed to work adequately with all drivers. They are provided primarily for testing and trouble-shooting; *e.g.* with `(driver)` configurations untested by the authors of X_Y-pic, who should be notified of any difficulties.

```

72 \xydef@UsePScolor{\installPScolor@}
73 \xydef@NoPScolor{\UnloadColor@}

```

Installation Installation consists of rebinding the macros `\xycolor@` and `\newxycolor@` and of reloading the standard colours to include a description for POSTSCRIPT. This installation should be delayed till after `color` and `ps` themselves have been installed.

```

86 \xydef@installPScolor@{\installPSstyle@
87 \let\xymath@=\xyPSmath@ \let\xynomath@=\xyPSnomath@
88 \let\checkxyPScolor@=\checkxyPScolor@@
89 \let\xycolor@@=\xyPScolor@@
90 \xystandardcolors@
91 \xyuncatcodes }

```

All effects defined in the `color` extension can be implemented using the POSTSCRIPT dictionary, loaded by `xyps-ps`. This file provides “generic” POSTSCRIPT code which is known to work correctly with most drivers. No attempt is made to provide special code for particular drivers; for driver-specific variations, consult the appropriate `xy(driver).doc` file.

4.11.7 Frames

The included file `xyps-f.tex` (version 3.10) provides POSTSCRIPT support for the effects defined in the `frame` extension described in §2.2. It implements some effects otherwise unattainable.

This file is loaded and its effects are activated automatically whenever `\xyoption{frame}` is requested and the current `<driver>` supports POSTSCRIPT effects for frames. Should there be any need to turn off this support, the following commands are available; they obey usual \TeX groupings.

```

\NoPSframes remove POSTSCRIPT support
\UsePSframes reinstate POSTSCRIPT.

```

Without POSTSCRIPT support ellipses may be shown as circles and all filled regions may be represented as black rectangles. These commands are provided primarily for testing and trouble-shooting; *e.g.* with $\langle\text{driver}\rangle$ configurations untested by the authors of X_y-pic, who should be notified of any difficulties.

Installation The $\langle\text{driver}\rangle$ -file must call the following macro to rebind control sequences defined in `xyframe`, thereby allowing the POSTSCRIPT methods to be used.

```

66 \xydef@installPSframes@{%
67 \let\framed@body@=\xyPSframed@body@
68 \let\circled@x@=\xyPScircled@x@
69 \let\ellipsed@x@=\xyPSellipsed@x@
70 \installPSfills@
71 \xyuncatcodes}
73 \xydef@UsePSframes{\installPSframes@}
74 \xydef@NoPSframes{\UnloadFrames@}

```

Frames: solid, dotted and dashed For solid frames use POSTSCRIPT ovals, otherwise adjust the spacing between dashes or dots according to the lengths, both vertical and horizontal.

```

```

4.11.9 Line-styles

The included file `xyps-1.tex` (version 3.10) provides POSTSCRIPT support for the effects defined in the `line` extension described in §2.4.

The POSTSCRIPT style methods are required, so ensure that they are loaded.

```

48 \expandafter\ifx\csname xyps-sloaded\endcsname\empty\else
49 \xyinputorelse@{xyps-s}{\xyerror@{Could not load xyps-s}{}}%
50 \xycatcodes\fi

```

This file is loaded and its effects are activated automatically whenever `\xyoption{line}` is requested and the current `(driver)` supports POSTSCRIPT line styles. Should there be any need to turn off this support, the following commands are available; they obey usual T_EX groupings.

```

\NoPSlines remove POSTSCRIPT support
\UsePSlines reinstate POSTSCRIPT.

```

Without POSTSCRIPT support lines can be expected to be displayed in the default style, having thickness of .4pt. These commands are provided primarily for testing and trouble-shooting; *e.g.* with `(driver)` configurations untested by the authors of X_y-pic, who should be notified of any difficulties.

Installation The `(driver)`-file must call the following macro to rebind a control sequence defined in `xyline`, thereby allowing the POSTSCRIPT method to be used. The purpose of the `\xyPSline@` hook is to allow the POSTSCRIPT style sequencing method to be used with other back-ends, changing just the contents of the `\specials` actually placed.

```

82 \xydef@\installPSline@{\installPSstyle@

4.11.11 Rotations and scaling

The included file `xyps-r.tex` (version 3.10) provides POSTSCRIPT support for the effects defined in the `rotate` extension described in §2.5.

The POSTSCRIPT style methods are required, so ensure that they are loaded.

```

48 \expandafter\ifx\csname xyps-sloaded\endcsname\empty\else
49 \xyinputorelse@{xyps-s}{\xyerror@{Could not load xyps-s}{}}%
50 \xycatcodes\fi

```

This file is loaded and its effects are activated automatically whenever `\xyoption{rotate}` is requested and the current \langle driver \rangle supports POSTSCRIPT rotations. Should there be any need to turn off this support, the following commands are available; they obey usual T_EX groupings.

```

\NoPSrotate remove POSTSCRIPT support
\UsePSrotate reinstate POSTSCRIPT.

```

Without POSTSCRIPT support diagrams can be expected to be displayed unrotated and unscaled. These commands are provided primarily for testing and trouble-shooting; *e.g.* with \langle driver \rangle configurations untested by the authors of Xy-pic, who should be notified of persistent difficulties.

Installation Call the following macro to allow the POSTSCRIPT mechanisms to be used.

```

78 \xydef@{\installPSrotscale@{\installPSstyle@
79 \let\xyRotate@@=\xyPSrotate@@
80 % \let\xySpecialRotate@@=\xyPSspecialRotate@
81 \let\doSpecialRotate@@=\doPSspecialRotate@@
82 % \let\xyRotnamed@=\xyPSpsxy@
83 % \let\xyRot@named@=\xyPSrot@named@@
84 \let\xyscale@@=\xyPSscale@@
85 \xyPSshapes@true
86 \xyuncatcodes }
88 \xydef@{\UsePSrotate{\installPSrotscale@}
89 \xydef@{\NoPSrotate{\UnloadRotate@\relax}

```

All effects defined in the `rotate` extension can be implemented using a POSTSCRIPT \langle driver \rangle . However different \langle driver \rangle s need not handle things in the same way; different POSTSCRIPT code may be required to match the specific environment used by the \langle driver \rangle .

This file provides generic POSTSCRIPT code which is known to work correctly with most drivers. It is written so as to indicate where modifications may be made to accomodate specific \langle driver \rangle s. For such driver-specific variations, consult the appropriate \langle driver \rangle -file, called `xy \langle driver \rangle .doc`.

```

109 \xydef@\xyPSpretransform@{\xyPSrawA@{\preXYtransform@@}}
110 \xydef@\xyPSposttransform@{\xyPSrawZ@{\postXYtransform@@}}
112 \let\preXYtransform@=\xyPSpretransform@
113 \let\postXYtransform@=\xyPSposttransform@
115 \xydef@\xyPSrotSplit@{%
116 \expandafter\def\expandafter\preShape@@\expandafter{\xyPSpre@}%
117 \expandafter\def\expandafter\postShape@@\expandafter{\xyPSpost@}}

```

Transform lists

```

125 \xydef@\xyPSScale@@#1#2{%
126 \xyPSSplitPS@{\xyscale@start(#1,#2)}{\xyscale@end}%
127 \xyPSrotSplit@\xyPSpsxy@ }

```

Rescaling

```

135 \xydef@\xyPSrotate@@#1{%
136 \xyPSSplitPS@{\xyrot@start(#1 xyd)}{\xyrot@end}%
137 \xyPSrotSplit@\xyPSpsxy@ }
139 \xydef@\xyPSSpecialRotate@#1{%
140 \xyPSSplitPS@{\xyrot@start(#1)}{\xyrot@end}\xyPSrotSplit@\xyPSpsxy@ }
142 \xydef@\doPSSpecialRotate@@#1@@{\xyPSSpecialRotate@{#1}}

```

Rotations The POSTSCRIPT operator `xyr` is defined in `xyps-ps.doc`, to store the given parameter as a rotation angle.

Shearing This feature is not implemented yet.

PostScript commands The POSTSCRIPT codes to start the rotation or scaling are given as functions, `xyrot@start` and `xyscale@start` with arguments to include a specification of the rotation-angle or scaling factors.

```

163 \xydef@\xyRotScale@@{%
164 \def\xyrot@start(##1){\xyt ##1\space xyr}}%
165 \def\xyscale@start(##1,##2){\xyt ##1\space##2\space xys}}%
166 \def\xyrot@end{}\def\xyscale@end{}}

```

These strings are placed using `\xyPSSplitPS@` so as to correctly occur before and after the code for the actual ⟨object⟩ being typeset. This is always followed by `\xyPSpsxy@`, which results in POSTSCRIPT code to identify the current position, storing it with keys `xyXpos` and `xyYpos` so as to be accessible to the code for the rotation or scaling.

A specific ⟨driver⟩ must either call `\xyRotScale@@` to use this default mechanism, or define its own macro to be called at installation time, which sets alternative expansions to `\xyrot@start(#1)`, `\xyscale@start(#1,#2)`, `\xyrot@end` and `\xyscale@end`.

4.11.13 Patterns and tiles

The included file `xyps-t.tex` (version 3.10) provides POSTSCRIPT support for the effects defined in the `tile` extension described in §2.7.

The POSTSCRIPT style methods are required, so ensure that they are loaded.

```

48 \expandafter\ifx\csname xyps-sloaded\endcsname\empty\else
49 \xyinputorelse@{xyps-s}{\xyerror@{Could not load xyps-s}{}}%
50 \xycatcodes\fi

```

This file is loaded and its effects are activated automatically whenever `\xyoption{tile}` is requested and the current `<driver>` supports POSTSCRIPT patterns. Should there be any need to turn off this support, the following commands are available; they obey usual \TeX groupings.

```

\NoPStiles remove POSTSCRIPT support
\UsePStiles reinstate POSTSCRIPT.

```

Without POSTSCRIPT support tile patterns can be expected to be displayed as solid black. These commands are provided primarily for testing and trouble-shooting; *e.g.* with `<driver>` configurations untested by the authors of Xy-pic, who should be notified of any difficulties.

Installation Installation consists of rebinding the macros `\xypattern@` and `\newxypattern@` and of reloading the standard patterns to include a description for POSTSCRIPT. This installation should be delayed till after `pattern` and the POSTSCRIPT `<driver>` have been installed.

```

81 \xymacro\installPSpatterns@{\installPSstyle@
82 \let\xypattern@=\xyPSpattern@@
83 \let\xypatternwarning@=\relax
84 \xystandardpatterns@

```

```

85  \xyuncatcodes }
87  \xylet\UnloadPSpatterns@=\Unloadpattern@
89  \xydef\UsePStiles{\installPSpatterns@}
90  \xydef\NoPStiles{\UnloadPSpatterns@\relax}

```

All effects defined in the `tile` extension can be implemented using the POSTSCRIPT dictionary, loaded by `xyps-ps`. This file provides “generic” POSTSCRIPT code which is known to work correctly with most drivers. No attempt is made to provide special code for particular drivers; for driver-specific variations, consult the appropriate `xy<driver>.doc` file.

Chapter 5

Fonts

This chapter presents the sources of the Xy-pic standard fonts used by the kernel for computations and as the default way to draw lines and frames in the DVI output; in addition we include font tables for key fonts where the characters are shown in double size.

(In the past, Y&Y Inc. gracefully produced high quality PostScript Type1 fonts of most of these, however, these are no longer needed as the FontForge project and MF2PT1 script together solve the task automatically rather well.)

To Do: Rewrite the METAFONT code to mft format with font tables.

5.1 Semidirectional font

These are fonts with symmetric characters in 128×2 directions created using the driver file `xyd2.mf`. The standard repertoire includes only one such font: `xydash10`.

5.1.1 `xyd2.mf`

```

Appendix A

Answers to all exercises

Answer to exercise 1.1 (p.23): In the default setup they all denote the reference point of the Xy -picture but the cartesian coordinate $\langle \text{pos} \rangle (0,0)$ denotes the point *origo* that may be changed to something else using the `:` operator.

Answer to exercise 1.2 (p.29): Use the $\langle \text{pos} \rangle$ ition $\langle X,Y \rangle + "ob"$.

Answer to exercise 1.3 (p.30): It first sets c according to “...”. Then it changes c to the point right of c at the same distance from the right edge of c as its width, w , *i.e.*,

Answer to exercise 1.4 (p.39): The $\langle \text{coord} \rangle$ “ $\{ "A"; "B": "C"; "D", x \}$ ” returns the cross point. Here is how the author typeset the diagram in the exercise:

```
\xy
%
% set up and mark A, B, C, and D:
(0,0)="A" *\cir<1pt>{}**!DR{A},
(7,10)="B" *\cir<1pt>{}**!DR{B},
(13,8)="C" *\cir<1pt>{}**!DL{C},
(15,4)="D" *\cir<1pt>{}**!DL{D},
%
% goto intersection and name+circle it:
{"A";"B":"C";"D",x} ="I" *\cir<3pt>{},
%
% make dotted lines:
"I";"A"**{} +/1pc/;-/1pc/ **@{..},
"I";"D"**{} +/1pc/;-/1pc/ **@{..}
%
\endxy
```

A ?!... $\langle \text{place} \rangle$ could also have been used.

Answer to exercise 1.5 (p.40): To copy the p value to c , *i.e.*, equivalent to “p”.

Answer to exercise 1.6 (p.41): When using the kernel connections that are all straight there is no difference, *e.g.*, `**{}?<` and `**{}+E` denote exactly the same position. However, for other connections it is not necessarily the case that the point where the connection enters the current object, denoted by `?<`, and the point where the straight line from p enters the object, denoted by `+E`, coincide.

Answer to exercise 1.7 (p.41): The code typesets the picture

Answer to exercise 1.8 (p.42): This does the job, saving each point to make the previous point available for the next piece:

```
\xy
@={(0,-10),(10,3),(20,-5)},
s0="prev" @@{"prev";**@{-}="prev"}
\endxy
```

Notice how we close the line by first saving `s0`, the last point visited, such that the first point will be connected to it.

Answer to exercise 1.9 (p.44): The author used

```
\xy ={.{+DL(2)}.{+UR(2)}}"dbl",
*+<3pc,2pc>{+}* \frm{.}, "dbl"* \frm{--}
\endxy
```

to typeset the figure in the exercise.

Answer to exercise 1.10 (p.52): The first typesets “ a ” centered around 0 and then moves c to the lower right corner, the second typesets “ a ” above the 0 point and does not change c . With a “+” at 0 they look like this: $\#$ and \mathcal{A} .

Answer to exercise 1.11 (p.53): They have the outlines

because the first is enlarged by the positive offset to the upper right corner and the second by the negative offset to the lower left corner.

Answer to exercise 1.12 (p.64): The first has no effect since the direction is set to be that of a vector in the current direction, however, the second reverses the current direction.

Answer to exercise 1.13 (p.65): None in both cases.

Answer to exercise 1.14 (p.80): One way is

```
$$\xy
*{+}; p+(6,3)*{+} **{} ?(1)
*@{-} *!/-5pt/^ \dir{-}
*^ \dir{-} *!/^ -5pt/ \dir{-}
\endxy$$
```

Thus we first create the two +s as p and c and connect them with the dummy connection `**{}` to setup the direction parameters. Then we move ‘on top of c ’ with `?(1)` and position the four sides of the square using `^` and `_` for local direction changes and `/⟨dimen⟩/` for skewing the resulting object by moving its reference point in the opposite direction.

Answer to exercise 1.15 (p.89): One way is to add extra half circles skewed such that they create the illusion of a shade:

```

$$\xy
*\cir<5pt>{}
*!<-.2pt,.2pt>\cir<5pt>\dr^ul}
*!<-.4pt,.4pt>\cir<5pt>\dr^ul}
*!<-.6pt,.6pt>\cir<5pt>\dr^ul}
\endxy$$

```

Answer to exercise 2.1 (p.123): This is the code that was actually used:

```

\xy (0,20)*[o]+{A};(60,0)*[o]+{B}="B"
**\crv{} \POS?(.4)*_+!UR{0},"B"
**\crv{(30,30)} \POS?*^+!D{1},"B"
**\crv{(20,40)&(40,40)} \POS?*^+!D{2},"B"
**\crv{(10,20)&(30,20)&(50,-20)&(60,-10)}
\POS?*+^!UR{4} \endxy

```

Answer to exercise 2.2 (p.123): This is the code that was used to typeset the picture:

```

\xy (0,20)**{A};(60,0)**{B}
**\crv{(10,20)&(30,20)&(50,-20)&(60,-10)}
?<*\dir{<} ?>*\dir{>}
?(.65)*{\oplus} *!LD!/^-5pt/{x}
?(.65)/12pt/*{\oplus} *!LD!/^-5pt/{x'}
?(.28)*=0{\otimes}-/40pt/*{Q}="q"
+/100pt/*{P};"q" **\dir{-}
\endxy

```

Answer to exercise 2.3 (p.124): Here is the code that was used to typeset the picture:

```

\def\ssz#1{\hbox{$_{\hat{#1}}$}}
\xy (0,0)**{A};(30,-10)**{B}="B",**\dir{-},
"B"*\crv{(5,20)&(20,25)&(35,20)}
?<(0)*\dir{<}="a" ?>(1)*\dir{>}="h"
?(.1)*\dir{<}="b" ?(.9)*\dir{>}="i"
?(.2)*\dir{<}="c" ?(.8)*\dir{>}="j"
?(.3)*\dir{<}="d" ?(.7)*\dir{>}="k"
?(.4)*\dir{<}="e" ?(.6)*\dir{>}="l"
?(.5)*\dir{|}="f",
"a"!*!RC\txt{\ssz{(\lt)}};
"h"!*!LC\txt{\ssz{\;(\gt)}},**\dir{.},
"b"!*!RD{\ssz{.1}};
"i"!*!L{\ssz{\; .9}},**\dir{-},

```

```
"c"!RD{\ssz{.2}};
"j"!L{\ssz{\;.8}},**\dir{-},
"d"!RD{\ssz{.3}};
"k"!L{\ssz{\;.7}},**\dir{-},
"e"!RD{\ssz{.4}};
"l"!LD{\ssz{.6}},**\dir{-},
"f"!D!/^-3pt/{\ssz{.5}}
\endxy
```

Answer to exercise 2.4 (p.202): Here is how:

```
\xy
(0,0) *++={A} *\frm{o} ;
(10,7) *++={B} *\frm{o} **\frm{.}
\endxy
```

Answer to exercise 2.5 (p.206): The `\cir {}` operation changes c to be round whereas `\frm {o}` does not change c at all.

Answer to exercise 2.6 (p.209): Here is how:

```
\xy
(0,0) *+++{A} ;
(10,7) *+++{B} **\frm{.}
**\frm{^{\}} ; **\frm{_{\}}
\endxy
```

The trick in the last line is to ensure that the reference point of the merged object to be braced is the right one in each case.

Answer to exercise 2.7 (p.236): This is how the author specified the diagram:

```
\UseCrayolaColors
\xy\drop[*1.25]\xybox{\POS
(0,0)*{A};(100,40)*{B}**{ }
?<<*[@_] [red] [o]=<5pt>{\heartsuit};
?>>*[@_] [Plum] [o]=<3pt>{\clubsuit}
**[|*][|.5pt][thicker]\dir{-},
?(.1)*[left]!RD\txt{label 1}*[red]\frm{.}
?(.2)*[!gsave newpath
xyXpos xyYpos moveto 50 dup rlineto
20 setlinewidth 0 0 1 setrgbcolor stroke
grestore] [psxy]{.},
?(.2)*[@]\txt{label 2}*[red]\frm{.},
?(.2)*[BurntOrange]{*},
?(.3)*[halFSIZE]\txt{label 3}*[red]\frm{.}
?(.375)*[flip]\txt{label 4}*[red]\frm{.}
?(.5)*[dblSIZE]\txt{label 5}*[red]\frm{.}
?(.5)*[WildStrawberry]{*},
?(.7)*[hflip]\txt{label 6}*[red]\frm{.}
?(.8)*[vflip]\txt{label 7}*[red]\frm{.}
```

```
?(.9)*[right]!LD\txt{label 8}*[red]\frm{.}
?(.5)*[@][*.66667]!/~30pt/
\txt{special effect: aligned text}
*[red]\frm{.}
}\endxy
```

Answer to exercise 3.1 (p.313): Here is what the author did:

```
\xy *+{A}*\cir<10pt>{}="me"
\PATH 'ul^ur,"me" "me" |>*(1,-.25)\dir{>}
\endxy
```

The trick is getting the arrow head right: the `:` modifier to the explicit `\dir` (object) does that.

Answer to exercise 3.2 (p.315): The author did

```
\xy(0,0)
\ar @{->} (30,7) ^A="a"
\POS(10,12)*+\txt{label} \ar "a"
\endxy
```

Answer to exercise 3.3 (p.320): Here is the entire X_Y-picture of the exercise:

```
\xy ;<1pc,0pc>:
\POS(0,0)*+{A}
\ar +(-2,3)*+{A'}*\cir{}
\ar @2 +( 0,3)*+{A''}*\cir{}
\ar @3 +( 2,3)*+{A''' }*\cir{}
\POS(6,0)*+{B}
\ar @1{||.>>} +(-2,3)*+{B'}*\cir{}
\ar @2{||.>>} +( 0,3)*+{B''}*\cir{}
\ar @3{||.>>} +( 2,3)*+{B''' }*\cir{}
\endxy
```

The first batch use the default `{->}` specification.

Answer to exercise 3.4 (p.321): The author used

```
\newdir{ >}{*!/-5pt/\dir{>}}
```

Answer to exercise 3.5 (p.321): The author used

```
\xy
\ar @{>>*\composite{\dir{x}*\dir{+}}<<}
(20,7)
\endxy
```

Answer to exercise 3.6 (p.322): The author used

```
\xy *{\circ}="b" \ar@(ur,ul) c
\ar@{.>}@(dr,ul) (20,0)*{\bullet}
\endxy
```

Note that it is essential that the curving specification comes after the arrow style.

Answer to exercise 3.7 (p.334): Here is the code used to typeset the *pasting diagram* in figure 3.3.

```
\xymatrixrowsep{1.5pc}
\xymatrixcolsep{3pc}
\diagram
&&\relax\rtwocell<0>^{f_3^{\}}\;\;}\{\omit}
&\relax\ddtwocell<0>\{\omit}
\drtwocell<0>^{\;\;f_4^{\}}\{<3>}
\ddrrtwocell<\omit>\{<8>\}\
&&&\relax\drtwocell<0>^{\;\;f_5^{\}}\{\omit}\
A \uurrlowertwocell<-6>\{\omit}\relax
\uurrcompositemap<2>_{f_1^{\}}^{f_2^{\}}\{<.5>}
\drtwocell<0>_{g_1^{\}}\;\;}\{\omit}
&&&\relax\urtwocell<0>\{\omit}
&&\relax\rtwocell<0>^{f_6^{\}}\;\;}\{\omit}
&\relax\rllowertwocell<-3>_{g_4^{\}}\{<-1>}
\rcompositemap<6>_{f_7^{\}}^{f_8^{\}}\{\omit}
& B \
&\relax\urrtwocell<0>\{\omit}
\xcompositemap[-1,4]\{
<-4.5>_{g_2^{\}}^{g_3^{\}}\{\omit}\
\enddiagram
```

For the straight arrows, it would have been simpler to use `\.to` provided `xyarrow` has been loaded. Instead `\.twocell<0>...{\omit}` was used to illustrate the versatility of nudging and `\omit`; thus `xy2cell` can completely handle a wide range of diagrams, without requiring `xyarrow`. Note also the use of `\relax` at the start of each new cell, to avoid premature expansion of a complicated macro, which can upset the compiling mechanism.

Answer to exercise 3.8 (p.338): Here is the code used by the author to set the first diagram.

```
{\uppercurveobject{?}}
\lowercurveobject{\circ}}
\xymatrixcolsep{5pc}
\xymatrixrowsep{2pc}
\diagram
\relax\txt{ FUn }\rtwocell<8>\{!\&}
& \relax\txt{ gaMES }
\enddiagram}
```

Here is the code used for the second diagram.

```
\xymatrixcolsep{2.5pc}
\xymatrixrowsep{4pc}
\diagram
\relax\txt<1.5cm>\{\bf Ground State}
\rllowertwocell<12>^{+{~**!/-2.5pt/\dir{>}}
~_{++{~**!/5pt/\dir{<<}}
^{<1.5>\txt{\small continuous power}}
_{<1.5>\txt{\small pulsed emission}}\{!}}
```

```
& \relax\;\; N\!i\C\!d\;\; \Circled
& \relax\txt<1.50cm>{\bf Excited State}
\enddiagram
```

Answer to exercise 3.9 (p.366): The author did

```
\xymatrix @!=1pc {
**[1] A\times B
\ar[r]^{/A} \ar[d]_{/B}
& B \ar[d]^{\times A}
\\
A \ar[r]_{B\times}
& **[r] B\times A
}
```

Answer to exercise 3.10 (p.367): Modifiers are used to make all entries round with a frame – the general form is used to ensure that the sequence is well-defined. Finally the matrix is rotated to make it possible to enter it as a simple square:

```
\entrymodifiers={=<1pc>[o] [F-]}
\xymatrix @ur {
A \save[];[r] **\dir{-},
\[];[dr]**\dir{-},
\[];[d] **\dir{-}\restore
& B \\
C & D }
```

Answer to exercise 3.11 (p.369): Here is how:

```
\xymatrix @W=3pc @H=1pc @R=0pc @*[F-] {%
: \save+<-4pc,1pc>*\hbox{\it root}
\ar[]
\restore
\\
{\bullet}
\save*{}
\ar{r[dd]+/r4pc/' [dd] [dd]}
\restore
\\
{\bullet}
\save*{}
\ar{r[d]+/r3pc/' [d]+/d2pc/
' [uu]+/l3pc/' [uu] [uu]}
\restore
\\
1 }
```

Answer to exercise 3.12 (p.375): The first A was named to allow reference from the last:

```
\xygraph{
```

```

[]A="A1" :@/^/ [r]A
      :@/^/ [r]A
      :@/^/ "A1" }

```

Answer to exercise 3.13 (p.378): The author did

```

\SelectTips{cm}{f}
\objectmargin={1pt}
\xygraph{ !{0;(.77,-.77):0}
!~:@{-}|@>}}
w (: [r(.6)]{x_1}
, : [d]z: [r]y: [u(.6)]{x_2}: "x_1": "z"
: @ ( {"w"; "z"}, {"y"; "z"}) "z": "x_2" ) }

```

It also shows that one *can* use {}s inside delimited arguments *provided* one adds a space to avoid the {}s being shaved off!

Answer to exercise 3.14 (p.381): Here is the code actually used to typeset the `\xypolygon` s, within an `\xygraph` . It illustrates three different ways to place the numbers. Other ways are also possible.

```

\def\objectstyle{\scriptscriptstyle}
\xy \xygraph{!{/r2pc/:}
[] !P3"A" {\bullet}
"A1"!{+U*++!D{1}} "A2"!{+LD*++!RU{2}}
"A3"!{+RD*++!LU{3}} "A0"
[rrr]*{0}*\cir<5pt>{ }
!P6"B" {~<-\cir<5pt>{ }}
"B1"1 "B2"2 "B3"3 "B4"4 "B5"5 "B6"6 "B0"
[rrr]0 !P9"C" {~*{\xypolynode}}}\endxy

```

Appendix B

Backwards Compatibility

Backwards compatibility with X_Y-pic version 2 is ensured by the ‘v2’ option and its support files.

B.1 Version 2 Compatibility

Vers. 3.7 by Kristoffer H. Rose <krisrose@tug.org>

This section describes the special backwards compatibility with X_Y-pic version 2: diagrams written according to the “Typesetting diagrams with X_Y-pic: User’s Manual” [14] should typeset correctly with this loaded. The compatibility is available either as an X_Y-option or through the special files `xypic.sty` and `xypic.tex` described below.

There are a few exceptions to the compatibility: the features described in §B.1.1 below are not provided because they are not as useful as the author originally thought and thus virtually never used. And one extra command is provided to speed up typesetting of documents with X_Y-pic version 2 diagrams by allowing the new compilation functionality with old diagrams.

The remaining sections list all the obsolete commands and suggest ways to achieve the same things using X_Y-pic 3.8.5, *i.e.*, without the use of this option. They are grouped as to what part of X_Y-pic replaces them; the compilation command is described last.

Note: “version 2” is meant to cover all public releases of X_Y-pic in 1991 and 1992, *i.e.*, version 1.40 and versions 2.1 through 2.6. The published manual cited above (for version 2.6) is the reference in case of variations between these versions, and only things documented in that manual will be supported by this option!¹

```
65 \xylet@XY=\Xy
```

B.1.1 Unsupported incompatibilities

Here is a list of known incompatibilities with version 2 even when the v2 option is loaded.

- Automatic ‘shortening’ of arrow tails using `|<<` breaks was a bug and has been ‘fixed’ so it does not work any more. Put a `|<\hole` break before it.
- The version 2.6 `*` position operator is not available. The version 2.6 construction $t_0;t_1*(x,y)$ should be replaced by the rather long but equivalent construction

$$\{t_0;p+/r/:t_1="1";p+/u/,x;(0,0);: "1";p+/r/,y;(0,0);::(x,y)\}$$

In most cases $t_0;t_1**\{ \}?(x)$, possibly with a trailing `+/\^.../`, suffices instead.

- Using $t_0;t_1:(x,y)$ as the target of an arrow command does not work. Enclose it in braces, *i.e.*, write

$$\{t_0;t_1:(x,y)\}$$

- The older `\pit`, `\apit`, and `\bpit` commands are not defined. Use `\dir{>}` (or `\tip`) with variants and rotation.
- The even older notation where an argument in braces to `\rto` and the others was automatically taken to be a ‘tail’ is not supported. Use the supported `|<...|` notation.

If you do not use these features then your version 2 (and earlier) diagrams should typeset the same with this option loaded except that sometimes the spacing with version 3 is slightly different from that of version 2.6 which had some spacing bugs.

B.1.2 Obsolete kernel features

The following things are added to the kernel by this option and described here: idioms, obsolete positions, obsolete connections, and obsolete objects. For each we show the suggested way of doing the same thing without this option:

Removed $\mathcal{A}\mathcal{M}\mathcal{S}$ - TEX idioms

Some idioms from $\mathcal{A}\mathcal{M}\mathcal{S}$ - TEX are no longer used by XY -pic: the definition commands `\define` and `\redefine`, and the size commands `\dsize`, `\tsize`, `\ssize`, and `\sssize`. Please use the commands recommended for your format—for plain TEX these are `\def` for the first two and `\displaystyle`, `\textstyle`, `\scriptstyle`, and `\scriptscriptstyle` for the rest. The `v2` option ensures that they are available anyway.

```

138 \ifx\redefine\undefined \let\redefine=\def \fi
139 \ifx\define\undefined \let\define=\xydef@ \fi

141 \ifx\dsize\undefined \let\dsize=\displaystyle \fi
142 \ifx\tsize\undefined \let\dsize=\textstyle \fi
143 \ifx\ssize\undefined \let\ssize=\scriptstyle \fi
144 \ifx\sssize\undefined \let\sssize=\scriptscriptstyle \fi

```

Version also 2 used the $\mathcal{A}\mathcal{M}\mathcal{S}$ - TEX `\text` and a (non-object) box construction `\Text` which are emulated—`\text` is only defined if not already defined, however, using the native one (of $\mathcal{A}\mathcal{M}\mathcal{S}$ - TEX or $\mathcal{A}\mathcal{M}\mathcal{S}$ - $\text{L}\text{A}\text{T}\text{E}\text{X}$ or whatever) if possible. Please use the `\txt` object construction described in §1.6.3 directly since it is more general and much more efficient!

```

155 \ifx\text\undefined
156 \def\text{\relax\textC}%
157 \xydef@\textC#1{\relax
158 \ifmmode\mathchoice
159 {\hbox{\the\textfont0\relax#1}}%

182 \fi\ignorespaces}
184 \xydef@\Text@ii{\hbox\bgroup \txt@i}

```

Obsolete state

Upto version 2.6 users could access the state variables `\cL`, `\cR`, `\cH`, and `\cD`, which are defined.

```

195 \xylet@\cL=\L@c
196 \xylet@\cR=\R@c
197 \xylet@\cD=\D@c
198 \xylet@\cH=\U@c

```

From v2.7 to 2.12 users could use the names of the state `\dimen` registers `\Xmin`, `\Xmax`, `\Ymin`, and `\Ymax`; `\Xp`, `\Yp`, `\Dp`, `\Up`, `\Lp`, and `\Rp`; `\Xc`, `\Yc`, `\Dc`, `\Uc`, `\Lc`, and `\Rc`; `\Xorigin`, `\Yorigin`, `\Xxbase`, `\Yxbase`, `\Xybase`, and `\Yybase`. Now the same effect can be achieved using `\corner`s but `v2` defines the aliases.

```

210 \xylet@\Xc=\X@c
211 \xylet@\Yc=\Y@c
212 \xylet@\Uc=\U@c
213 \xylet@\Dc=\D@c
214 \xylet@\Lc=\L@c
215 \xylet@\Rc=\R@c

217 \xylet@\Xp=\X@p
218 \xylet@\Yp=\Y@p
219 \xylet@\Up=\U@p
220 \xylet@\Dp=\D@p
221 \xylet@\Lp=\L@p
222 \xylet@\Rp=\R@p

224 \xylet@dX=\d@X
225 \xylet@dY=\d@Y

227 \xylet@\Xorigin=\X@origin
228 \xylet@\Yorigin=\Y@origin
229 \xylet@\Xxbase =\X@xbase
230 \xylet@\Yxbase =\Y@xbase
231 \xylet@\Xybase =\X@ybase
232 \xylet@\Yybase =\Y@ybase

234 \xylet@\Xmin=\X@min
235 \xylet@\Ymin=\Y@min
236 \xylet@\Xmax=\X@max
237 \xylet@\Ymax=\Y@max

```

Obsolete position manipulation

In version 2 many things were done using individual `\decor` control sequences that are now done using `\pos` operators.

Version 2 positioning Replacement	
<code>\go<pos></code>	<code>\POS;p,<pos></code>
<code>\aftergo{<decor>}<pos></code>	<code>\afterPOS{<decor>};p,<pos></code>
<code>\merge</code>	<code>\POS.p\relax</code>
<code>\swap</code>	<code>\POS;\relax</code>
<code>\Drop{<text>}</code>	<code>\drop+{<text>}</code>

The code is basically that of `xy.doc 2.6...`

```

263 \xydef@\go{\aftergo{}}
264 \xydef@\aftergo#1{\xy@\aftergo{\enter@\pfromthec@}\afterPOS{\xy@@\leave@#1}}
266 \xydef@\merge{\POS.p\relax}
268 \xydef@\swap{\xy@\swap\swap@}
270 \xydef@\Drop{\expandafter\drop\entrymodifiers@}

```

Obsolete connections

These connections are now implemented using directionals.

Version 2 connection	Replacement
<code>\none</code>	<code>\connect h\dir{}</code>
<code>\solid</code>	<code>\connect h\dir{-}</code>
<code>\Solid</code>	<code>\connect h\dir2{-}</code>
<code>\Ssolid</code>	<code>\connect h\dir3{-}</code>
<code>\dashed</code>	<code>\connect h\dir{--}</code>
<code>\Dashed</code>	<code>\connect h\dir2{--}</code>
<code>\Ddashed</code>	<code>\connect h\dir3{--}</code>
<code>\dotted</code>	<code>\connect h\dir{.}</code>
<code>\Dotted</code>	<code>\connect h\dir2{.}</code>
<code>\Ddotted</code>	<code>\connect h\dir3{.}</code>
<code>\dottedwith{(text)}</code>	<code>\connect h{(text)}</code>

Note how the ‘hidden’ specifier `h` should be used because version 2 connections did not affect the size of diagrams.

```

298 \xydef@\none{\xy@\none{}}\ignorespaces}
300 \xydef@\solid{\connect h\dir{-}}
301 \xydef@\Solid{\connect h\dir2{-}}
302 \xydef@\Ssolid{\connect h\dir3{-}}
304 \xydef@\dashed{\connect h\dir{--}}
305 \xydef@\Dashed{\connect h\dir2{--}}
306 \xydef@\Ddashed{\connect h\dir3{--}}
308 \xydef@\dotted{\connect h\dir{.}}
309 \xydef@\Dotted{\connect h\dir2{.}}
310 \xydef@\Ddotted{\connect h\dir3{.}}
312 \xydef@\dottedwith#1{\connect h{#1}}

```

Obsolete tips

These objects all have `\dir`-names now:

Version 2 tip	Replacement
<code>\notip</code>	<code>\dir{}</code>
<code>\stop</code>	<code>\dir{ }</code>
<code>\astop</code>	<code>\dir^{ }</code>
<code>\bstop</code>	<code>\dir_{ }</code>

```

\tip      \dir{>}
\atip     \dir^{>}
\btip     \dir_{>}
\Tip      \dir2{>}
\ATip     \object=<5pt>:(32,-1)\dir^{>}
\BTip     \object=<5pt>:(32,+1)\dir_{>}
\Ttip     \dir3{>}
\ahook    \dir^{(}
\bhook    \dir_{(}
\aturn    \dir^{'}
\bturn    \dir_{'}

```

```

344 \xydef@notip{\dir{}}
346 \xydef@stop{\dir{|}}
347 \xydef@astop{\dir^{|}}
348 \xydef@bstop{\dir_{|}}
350 \xydef@tip{\dir{>}}
351 \xydef@atip{\dir^{>}}
352 \xydef@btip{\dir_{>}}
354 \xydef@Tip{\dir2{>}}
356 \xywarnifdefined\ATip
357 \xywarnifdefined\BTip
358 {\xyuncatcodes
359 \gdef\ATip{\object=<5pt>:(32,-1)\dir^{>}}
360 \gdef\BTip{\object=<5pt>:(32,+1)\dir_{>}}}
362 \xydef@Ttip{\dir3{>}}
364 \xydef@ahook{\dir^{(}}
365 \xydef@bhook{\dir_{(}}
367 \xydef@aturn{\dir^{'}}
368 \xydef@btturn{\dir_{'}}

```

The older commands `\pit`, `\apit`, and `\bpit`, are not provided.

Obsolete object constructions

The following object construction macros are made obsolete by the enriched `<object>` format:

Version 2 object	Replacement
<code>\rotate(<factor>)<tip></code>	<code>\object:(<factor>,<factor>){<tip>}</code>
<code>\hole</code>	<code>\object+{}</code>
<code>\squash<tip></code>	<code>\object=0{<tip>}</code>
<code>\grow<tip></code>	<code>\object+{<tip>}</code>
<code>\grow<dimen><tip></code>	<code>\object+<dimen>{<tip>}</code>
<code>\squarify{<text>}</code>	<code>\object+={<text>}</code>
<code>\squarify<dimen>{<text>}</code>	<code>\object+=<dimen>{<text>}</code>

where rotation is done in a slightly different manner in version 3.8.5 (it was never accurate in version 2).

These are mostly just the unmodified version 2.6 code:

```

403 \xydef@rotate{\hbox\bgroup
404 \DN@{\ifx (\next %)
405 \DN@{####1}{\rotate@ii{####1}}}%
406 \else \DN@{\rotate@i}\fi\next@\xyFN@next@}
408 \xydef@rotate@i#1{\reverseDirection@ #1\OBJECT@x}
410 \xydef@rotate@ii#1#2{\dimen@=#1\p@
411 \ifdim \dimen@=-\p@ \aboveDirection@\xydashl@
412 \else\ifdim\dimen@= \p@ \belowDirection@\xydashl@
413 \else\ifdim\dimen@<-1.5\p@ \advance\dimen@-2\p@
414 \edef\next@{\expandafter\removePT@the\dimen@}\vDirection@(-1,\next@){1pc}%
415 \else\ifdim\dimen@<-.5\p@ \vDirection@(#1,-1){1pc}%
416 \else\ifdim\dimen@<.5\p@ \vDirection@( 1,#1){1pc}%
417 \else\ifdim\dimen@<1.5\p@ \vDirection@(#1, 1){1pc}%
418 \else \dimen@=-\dimen@ \advance\dimen@2\p@
419 \edef\next@{\expandafter\removePT@the\dimen@}\vDirection@(-1,\next@){1pc}%
420 \fi\fi\fi\fi\fi\fi
421 #2\OBJECT@x}
423 \xydef@squash#1{%
424 \ifmode\setboxz@h{\m@th$\mathstrut}#1{\mathstrut}$}\else\setboxz@h{#1}\fi
425 \setboxz@h{\kern-.5\wdz@ \dimen@=.5\ht\z@ \advance\dimen@-.5\dp\z@
426 \lower\dimen@\boxz@}%
427 \wdz@=\z@ \ht\z@=\z@ \dp\z@=\z@ \boxz@}
429 \xydef@grow{%
430 \DN@{\ifx <\next \DN@<####1>{\dimen@=####1\grow@empty}}%
431 \else \DN@{\dimen@=2\p@ \grow@empty}\fi\next@\xyFN@next@}
433 \xydef@grow@#1#{\grow@@{#1}}
434 \xydef@grow@@#1#2{\relax
435 \ifmode \setboxz@h{\kern\dimen@ \m@th$#2$\kern\dimen@}%

437 \dimen@ii=\ht\z@ \advance\dimen@ii\dimen@ \ht\z@=\dimen@ii
438 \dimen@ii=\dp\z@ \advance\dimen@ii\dimen@ \dp\z@=\dimen@ii \boxz@}
440 \xydef@squarify{\addEQ@{\addPLUS@object}}

```

We also reimplement the version 2 undocumented `\qc` quarter circle which is now called `\corn@` of the frame extension.

```

447 \xydef@qc{\corn@}

```

B.1.3 Obsolete extensions & features

Version 2 had commutative diagram functionality corresponding to the `frames` extension and parts of the `matrix` and `arrow` features. These are therefore loaded and some extra definitions added to emulate commands that have disappeared.

Frames

The version 2 frame commands are emulated using the frame extension (as well as the `\dotframed`, `\dashframed`, `\rounddashframed` commands communicated to some users by electronic mail):

Version 2 object	Replacement
<code>\framed</code>	<code>\drop\frm{-}</code>
<code>\framed<dimen></code>	<code>\drop\frm<dimen>{-}</code>
<code>\Framed</code>	<code>\drop\frm{=}</code>
<code>\Framed<dimen></code>	<code>\drop\frm<dimen>{=}</code>
<code>\dotframed</code>	<code>\drop\frm{.}</code>
<code>\dashframed</code>	<code>\drop\frm{--}</code>
<code>\rounddashframed</code>	<code>\drop\frm{o-}</code>
<code>\circled</code>	<code>\drop\frm{o}</code>
<code>\Circled</code>	<code>\drop\frm{oo}</code>

For each of the above commands (and a few hidden ones) we parse the above and convert to the proper format.

```

487 \xyrequire{frame}\xycatcodes
489 \xydef@\framed{\relax\convertframed{-}}
490 \xydef@\Framed{\relax\convertframed{=}}
492 \xydef@\circled{\relax\convertframed{o}}
493 \xydef@\Circled{\relax\convertframed{oo}}
495 \xydef@\convertframed#1{\DNii@##1@{\drop\frm##1{#1}}\xyFN@\convertframed@i}
497 \xydef@\convertframed@i{%
498   \addLT@\ifx \next
499   \addGT@{\addLT@\DN@##1}{\addGT@{\addLT@\nextii@##1}@}%
500   \else \DN@\nextii@ @\fi \next@}
502 \xydef@\dotframed{\relax\drop\frm{.}}
503 \xydef@\dashframed{\relax\drop\frm{--}}
504 \xydef@\rounddashframed{\relax\drop\frm{o-}}
506 \xydef@\filled{\DN@{%
507   \addLT@\ifx \next
508   \addGT@{\addLT@\DN@###1}{\xy@@{\frame@fill@{###1}}}%
509   \else \DN@\xy@@{\frame@fill@\z@}}%
510   \fi\next@}\xyFN@\next@}
512 \xydef@\Filled{\DN@{%
513   \addLT@\ifx \next
514   \addGT@{\addLT@\DN@###1}{\xy@@{\frame@emph@{###1}}}%
515   \else \DN@\xy@@{\frame@emph@\z@}}%
516   \fi\next@}\xyFN@\next@}

```

Matrices

The `\diagram <rows> \enddiagram` command is provided as an alias for `\xymatrix{ <rows> }` centered in math mode and `\LaTeXdiagrams` changes it to use `\begin ... \end` syntax. `v2` sets a special internal ‘old matrix’ flag such that trailing `\\` are ignored and entries starting with `*` are safe.

```

530 \xyrequire{matrix}\xycatcodes
534 \xydef@diagram#1\enddiagram{\relax\diagram@\diagram@@{#1}}
536 \xydef@diagram@{\relax
537 \ifmode \DN@##1##2{\vcenter{\oldxymatrix@true \xy##1{\xymatrix{##2}}\endxy}}%
538 \else\DN@##1##2{\oldxymatrix@true \xy/u.8ex/##1{\xymatrix{##2}}\endxy}}%
539 \fi \next@}
541 \xydef@LaTeXdiagrams{\def\diagram{\ltxdiagram@\diagram@@}%
542 \def\diagramnocompile{\ltxdiagram@\literal@}% Declared in Compiling
543 \def\diagramcompileto##1{\ltxdiagram@{\NoCompileMatrices\xycompileto{##1}}}}
545 \xydef@ltxdiagram@#1#2\end#3{\relax
546 \DN@{#3}\DNii@{diagram}\ifx\next@\nextii@\diagram@{#1}{#2}\end{diagram}%
547 \else\xyerr@{Put \string{\string} around \string\begin...\string\end\space
548 within diagrams}\fi}
550 \xylet@\diagram@@=\literal@
552 \xydef@NoisyDiagrams{}

```

`\NoisyDiagrams` is ignored because the matrix feature always outputs progress messages.

Finally the version 2 `\spreaddiagramrows`, `\spreaddiagramcolumns` spacing commands are emulated using `\xymatrixrowsep` and `\xymatrixcolsep`:

```

563 \xydef@\spreaddiagramrows#1{\addPLUS@\xymatrixrowsep{#1}}
564 \xydef@\spreaddiagramcolumns#1{\addPLUS@\xymatrixcolsep{#1}}

```

Arrows

The main arrow commands of version 2 were the `\morphism` and `\definemorphism` commands which now have been replaced by the `\ar` command.

v2 provides them as well as uses them to define the version 2 commands `\xto`, `\xline`, `\xdashed`, `\xdotted`, `\xdouble`, and all the derived commands `\dto`, `\urto`, ...; the `\arrow` commands of the β -releases of v3 is also provided.

Instead of commands like `\rrto` and `\uldouble` you should use the arrow feature replacements `\ar[rr]` and `\ar@{=}[ul]`.

The predefined turning solid arrows `\lltou`, ..., `\tord` are defined as well; these are now easy to do with `\turn`s.

```

596 \xyrequire{arrow}\xycatcodes
597 \xylet@\arrow=\ar
598 \morphism is a reduced version of the \ar command.
603 %\xyuncatcodes \catcode35=6
604 % \def\next#1#2#3{\relax \PATH ~={#1} ~>{\POS?>*{#2}\relax} ~<{\POS;?<*{#3};\relax}}
605 %\xycatcodes
606 %\xylet@\morphism=\next
607 {\xyuncatcodes
608 \gdef\morPHISM#1#2#3{\PATH~={\oldconnect{#1}}~<{|<*{#3}}~>{|>*{#2}}}}
609 \xydef@\morphism{\relax\morPHISM}
610 \xylet@\connect@iii=\connect
611 \xydef@\oldconnect#1{%

```

```

615 \let\PATHlabelabove@@=\PATHlabelabove@ %KLUDGE!
616 \let\PATHlabelbelow@@=\PATHlabelbelow@
617 \let\connect=\preconnect#1\let\connect=\connect@iii}

```

To Do: Unpack this to what \PATH does...

\definemorphism is essentially unchanged except we now use the privacy checking commands.

```

626 \xydef@definemorphism#1#2#3#4{%
627 \xydefcsname@{x#1}{\morphism{#2}{#3}{#4}}%
628 \xydefcsname@{u#1}{\morphism{#2}{#3}{#4}[u]}%
629 \xydefcsname@{d#1}{\morphism{#2}{#3}{#4}[d]}%
630 \xydefcsname@{l#1}{\morphism{#2}{#3}{#4}[l]}%
631 \xydefcsname@{r#1}{\morphism{#2}{#3}{#4}[r]}%
632 \xydefcsname@{uu#1}{\morphism{#2}{#3}{#4}[uu]}%
633 \xydefcsname@{dd#1}{\morphism{#2}{#3}{#4}[dd]}%
634 \xydefcsname@{ll#1}{\morphism{#2}{#3}{#4}[ll]}%
635 \xydefcsname@{rr#1}{\morphism{#2}{#3}{#4}[rr]}%
636 \xydefcsname@{ur#1}{\morphism{#2}{#3}{#4}[ur]}%
637 \xydefcsname@{ul#1}{\morphism{#2}{#3}{#4}[ul]}%
638 \xydefcsname@{dr#1}{\morphism{#2}{#3}{#4}[dr]}%
639 \xydefcsname@{dl#1}{\morphism{#2}{#3}{#4}[dl]}%
640 \xydefcsname@{uul#1}{\morphism{#2}{#3}{#4}[uul]}%
641 \xydefcsname@{uur#1}{\morphism{#2}{#3}{#4}[uur]}%
642 \xydefcsname@{ull#1}{\morphism{#2}{#3}{#4}[ull]}%
643 \xydefcsname@{urr#1}{\morphism{#2}{#3}{#4}[urr]}%
644 \xydefcsname@{ddl#1}{\morphism{#2}{#3}{#4}[ddl]}%
645 \xydefcsname@{ddr#1}{\morphism{#2}{#3}{#4}[ddr]}%
646 \xydefcsname@{dll#1}{\morphism{#2}{#3}{#4}[dll]}%
647 \xydefcsname@{drr#1}{\morphism{#2}{#3}{#4}[drr]}%
648 \xydefcsname@{uull#1}{\morphism{#2}{#3}{#4}[uull]}%
649 \xydefcsname@{uurr#1}{\morphism{#2}{#3}{#4}[uurr]}%
650 \xydefcsname@{ddll#1}{\morphism{#2}{#3}{#4}[ddll]}%
651 \xydefcsname@{ddrr#1}{\morphism{#2}{#3}{#4}[ddrr]}}
653 \definemorphism{to}\solid\tip\notip
654 \definemorphism{line}\solid\notip\notip
655 \definemorphism{dashed}\dashed\notip\notip
656 \definemorphism{dotted}\dotted\notip\notip
657 \definemorphism{double}\Solid\notip\notip

```

To Do: These could be *hugely* optimised by using the **arrow** feature directly...

Next the predefined bent morphisms of version 2. These required some hacking to work; I hope this doesn't mean that the ⟨path⟩ semantics has changed to much... ☹

```

668 \xywarnifdefined\xyviitoi

Finally the version 2 arrow radius default command that actually never worked but some people might have hoped...

```
715 \xydef@TurnRadius{\addEQ@turnradius}
```

B.1.4 Obsolete loading

The v2 User's Manual says that you can load Xy-pic with the command `\input xypic` and as a L^AT_EX 2.09 'style option' [xypic]. This is made synonymous with loading this option by the files `xypic.tex` and `xypic.sty` distributed with the v2 option.

xypic.doc

This file (version 3.5) just loads the v2 feature.

```

1  %% $Id: xypic.doc,v 3.5 2010/06/10 18:45:50 krisrose Exp $

```

B.1.5 Compiling v2-diagrams

In order to make it possible to use the new compilation features even on documents written with Xy-pic v2, the following command was added in v2.12:

```
\diagramcompileto{ <name> } ... \enddiagram
```

which is like the ordinary diagram command except the result is compiled (see note 1.5e). Note that compilation is not quite safe in all cases!

```

767 \xydef\diagramcompileto#1#2\enddiagram{\relax
768 \diagram@\NoCompileMatrices\xycompileto{#1}{#2}}

```

There is also the following command that switches on *automatic compilation* of all diagrams created with the v2 `\diagram ... \enddiagram` command:

```
\CompileAllDiagrams { <prefix> }
\NoCompileAllDiagrams
```

`\ReCompileAllDiagrams`

will apply `\xycompileto{<prefix>n}{...}` to each diagram with n a sequence number starting from 1. Use `\CompileMatrices` and `\CompilePrefix` instead!

If for some reason a diagram does not work when compiled then replace the `\diagram` command with `\diagramnocompile` (or in case you are using the L^AT_EX form, `\begin{diagramnocompile}`).

```
791 \xydef@diagramnocompile#1\enddiagram{\relax\diagram@literal@{#1}}
```

```
795 \xydef@CompileAllDiagrams#1{\CompilePrefix{#1}\CompileMatrices}
```

```
796 \xydef@NoCompileAllDiagrams{\NoCompileMatrices}
```

```
797 \xydef@ReCompileAllDiagrams{\CompileMatrices}
```

End & log

```

B.2 Obsolete fonts

These fonts are obsolete since v2.7 but remain part of the distribution to make it possible to print DVI files created with version 2.6 and earlier versions. We show the “misc” font in reduced size so it fits.

Appendix C

Licenses

C.1 GNU General Public License

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software—to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation’s software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author’s protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors’ reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone’s free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

Terms and conditions for copying, distribution and modification

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The “Program”, below, refers to any such program or work, and a “work based on the Program” means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term “modification”.) Each licensee is addressed as “you”.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program’s source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:
 - a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
 - b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
 - c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:
 - a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
 - b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
 - c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.
5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.
6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the

Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.
9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.
12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

Appendix: How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>
```

```
This program is free software; you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation; either version 2 of the License, or
(at your option) any later version.
```

```
This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.
```

```
You should have received a copy of the GNU General Public License along
with this program; if not, write to the Free Software Foundation, Inc.,
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA.
```

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) 19yy name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type 'show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type 'show c' for details.
```

The hypothetical commands ‘show w’ and ‘show c’ should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than ‘show w’ and ‘show c’; they could even be mouse-clicks or menu items—whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a “copyright disclaimer” for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the program
'Gnomovision' (which makes passes at compilers) written by James Hacker.
```

```
<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

C.2 Font General Public License Exceptions

Version 1, October 1998

Copyright (C) 1998 Kristoffer H. Rose <krisrose@tug.org>

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

Software for typesetting frequently includes fonts of characters. If this software is covered by the GNU General Public License, then a document, created as a result of running the software, which also contains the fonts (for example for presentation purposes), is a “derived” work. This license grants specific rights to separately distribute fonts in order to make it clear that documents containing the fonts (with the purpose of printing and viewing the characters and images depicted in the document) are permitted.

Exception Terms and Conditions

0. This License applies to any font or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of the GNU General Public License, either version 2 or a later version, below the “License”, with the explicit mention that the exceptions of this Font General Public License Exceptions, below the “Exceptions”, apply.

The “Font”, below, refers to just the single file that has the explicit mention that these Exceptions apply.

All other terms used are those of the License.

1. You may distribute any unmodified version of the Font without the requirement that the full remaining source of the Program is enclosed.

An intact copy of the Font file with the same name, insofar as the environment where the file is stored permits this, is considered as an unmodified version.

2. You may distribute files with the Font translated to another format provided that the following two conditions are met:
 - a) The name of the Font, if it appears, must remain the same or be as close to the original name as the format permits.
 - b) You accompany the file by a prominent notice about the lack of warranty for the Font as detailed in the GPL.
3. You may include fragments of the Font, or of the Font translated to another format, in documents or other work with the purpose of making it possible to view or print the document, provided that you accompany the document with a prominent notice about the lack of warranty of any kind for the Font, as detailed in the GPL.

End of Exception Terms and Conditions

Appendix: How to Apply These Terms to Your New Fonts

If you develop a new font or an icon as part of a program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms. However, in order to avoid encumbering the use of your font in printable and viewable formats, you may want to include this exception notice with it.

To do so, attach the following notices to the font source file. It is safest to attach them to the start of the source file to most effectively convey the exclusion of warranty; and each file should have at least the “copyright” line and a pointer to where the full notice is found.

```
<one line to give the font's name and a brief idea of what it does.>
Copyright (C) yyyy <name of author>
```

```
This program is free software; you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation; either version 2 of the License, or
(at your option) any later version.
```

```
This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.
```

```
You should have received a copy of the GNU General Public License
along with this program; if not, see http://www.gnu.org/licenses/.
```

```
Special permission is granted to distribute this font separately
under the terms of the Font General License Exceptions enclosed
with this program.
```

Otherwise follow the instructions in the appendix of the GNU General Public License.

Appendix D

Distribution support files

This appendix presents the sources of various support files that are part of the X_Y-pic source distribution (except the file COPYING that contains the text reproduced in appendix A): the files with ‘hype’ for the package, the installation instructions, and the generation instructions (to make X_Y-pic from the sources).

D.1 Hype

These files explain what X_Y-pic is, including as a CTAN ‘L^AT_EX 2_ε bundle’ standard.

D.1.1 CATALOG

```
1 Name: xypic
2 Version: 3.8.5 <2011/02/11>
4 Description: Xy-pic is a package for typesetting graphs and diagrams.
5 It is structured as several modules, each defining a custom notation for
6 a particular kind of graphical object or structure. Example objects are
7 arrows, curves, frames, and colouring/rotation on drivers that support
8 it; these can be organised in matrix, directed graph, path, polygon, knot,
9 and 2-cell structure. Xy-pic works with most formats, including LaTeX,
10 AMS-LaTeX, AMS-TeX, and plain TeX, and has been used to typeset
11 complicated diagrams from many application areas including category
12 theory, automata theory, algebra, neural networks, and database theory.
14 Keywords: diagram, picture, graph, arrow, curve, commutative diagram,
15 knot, braid, two-cell, cartesian coordinates, tree.
17 Author: Kristoffer H. Rose
18 Problems-To: xy-pic@tug.org
19 Address: IBM T.J.Watson Research Center, PO Box 704, Yorktown Heights, NY 10598, USA
21 <URL: http://xy-pic.sourceforge.net>
```

D.1.2 README

```
1 -*-text-*- $Id: README,v 3.11 2010/05/06 17:46:29 krisrose Exp $
3 =====
4 THE Xy-pic PACKAGE FOR TYPESETTING GRAPHS AND DIAGRAMS
5 =====
```

7 Xy-pic is a package for typesetting graphs and diagrams with TeX.

9 It works with most formats, including LaTeX (both 2.09 and 2e),
10 AMS-LaTeX, AMS-TeX, and plain TeX.

12 It has been used to typeset complicated diagrams from many application
13 areas including category theory, automata theory, algebra, neural
14 networks, and database theory.

16 - o -

18 See below in this file for an overview of the structure and features!

19 See CATALOG for up to date version information!

20 See TRAILER for author and accessibility information!

21 See COPYING for the conditions for redistribution and modification!

22 See VERSIONS for the exact list of the versions of all source files!

23 See INSTALL for how to install Xy-pic on your system!

24 Go to <URL: <http://xy-pic.sourceforge.net>> for source and news!

26 - o -

28 Xy-pic is structured as a 'kernel' and several orthogonal modules called
29 'options', each defining a custom notation for a particular kind of
30 graphical object or structure.

32 These (combinable) structures are available:

34 * A graph combinator mode where diagrams are specified the way they are
35 composed as graphs.

37 * A matrix-like mode where the dimensions of the drawing are computed by
38 aligning diagram entries in rows and columns (this is the 'diagram'
39 mode Xy-pic version 2 users are used to).

41 * A polygon mode where diagrams shaped as regular polygons are entered
42 in a simple way.

44 * A mode for typesetting beautiful knots and links.

46 * A general object-oriented 'turtle graphic' drawing language for
47 specifying graphs with objects and connections between them in a
48 manner independent of orientation.

50 * An experimental facility for generating movies where diagrams wiggle
51 and bend into place...

53 The following objects may be used:

55 + Positions can be given in variety of formats (extendable) including
56 user defined coordinates (x,y) and relative to previous positions,
57 objects, object edges, and points on connections.

59 + Objects may be circular, elliptic, or rectangular (more shapes can be
60 added) and adjusted in several ways.

62 + Large library of objects with mnemonic names.

64 + Objects that orient themselves along a connection when placed relative
65 to it, e.g., '\dir{[-]}' is like \vdash but thus oriented; new such
66 objects can be defined in a convenient way.

68 + TeX 'boxes', i.e., text and mathematical formulae.

70 + Includes circle segments and optionally arbitrary elliptical,
 71 quadratic, and cubic arcs.

73 + Connections are aligned between the reference points of objects but
 74 start and end on the edges.

76 + Any object can be used to build a connection (using ‘diagonal
 77 filling’); library objects provide common line types.

79 + Flexible notation for drawing arrows and general paths with tail,
 80 stem, and head built from any object(s). Special support for arrows
 81 that cross each other, arrows that ‘go by’ other entries, paired
 82 arrows (including support for 2-cells), curved arrows, and arrows with
 83 bends.

85 + Library of frames and braces.

87 + Special notation for rotation, scaling, colour, and line thickness.
 88 The correct typesetting of these features requires a backend that
 89 supports it (i.e., PostScript) but even when this is not available
 90 Xy-pic tries to approximate what is requested such that at least the
 91 picture size is stable (and thus page breaks).

93 + Output can use PDF or PostScript for drawing (several \special
 94 formats are supported, including pdfTeX, dvips, and Textures).
 95 Notation for inclusion of literal PostScript is available.

97 * Other graphics can be imported and then ‘decorated’ using Xy-pic.
 99 All object forms may be used with all structures.

101 - o -

103 Finally, enjoy Xy-pic!

105 Sincerely,

106 Kristoffer H. Rose <krisrose@tug.org>
 107 Ross Moore <ross.moore@mq.edu.au>

D.1.3 TRAILER

1 **-*-text-*- \$Id: TRAILER,v 3.22 2011/02/11 04:16:21 krisrose Exp \$**

3 =====

4 ANNOUNCING the Xy-pic version 3.8 DIAGRAM TYPESETTING PACKAGE

5 =====

7 This is to announce a release of the diagram typesetting package Xy-pic.
 8 It has been more than a decade, so we found that a release was in order.

10 -----

11 GENERAL

12 -----

14 Xy-pic is a package for typesetting a variety of graphs and diagrams
 15 with TeX. Xy-pic works with most formats (including LaTeX, AMS-LaTeX,
 16 AMS-TeX, and plain TeX).

18 Further specifics of the package are in the distribution README file
 19 and other documentation.

21 -----
 22 NEWS
 23 -----

25 Release 3.8.5 fixes some problems with xypdf, notably when used
 26 together with the beamer package.

28 Release 3.8.4 fixes a scoping bug in xypdf that made color definitions
 29 "bleed" to surrounding text (thanks to John G. Bullock for the report).

31 Release 3.8.3 fixes the xycirc10 font to work around a limitation of
 32 the mf2pt1 tool (thanks to Daniel Müllner's fix).

34 Release 3.8.2 fixes the xypic.map file to load the bitmap fonts
 35 correctly (thanks to Alexander Perlis for the analysis).

37 Release 3.8.1 includes the missing ".enc" files in the distribution.

39 The primary purpose of release 3.8 is to incorporate support for
 40 proper PDF output by including Daniel Müllner's "xypdf" package using
 41 native PDF for drawing. The driver is integrated with most of
 42 Xy-pic's extensions, however, there may still be gray areas where
 43 support is sketchy, so please try your favorite diagrams with pdfTeX
 44 and tell us if it works for you. We're grateful to Daniel for having
 45 contributed such a key piece of infrastructure that Xy-pic has been
 46 lacking for many years.

48 This version also marks the first version where xymatrix entries are
 49 aligned by their math axis by default as suggested by Alexander Perlis
 50 (in TUGboat 22 (2001), 330-334); thanks to Alexander for the thorough
 51 analysis. Please check whether your matrices still work as you
 52 expect!

54 Also thanks to Jeremy Gibbons for contributing the new "lu" style of
 55 arrow tips suitable for use with Lucida, and to Scott Pakin and the
 56 FontForge team for the great programs now used to generate all Type1
 57 fonts directly from their METAFONT sources.

59 Release 3.8 furthermore fixes a few bugs in release 3.7; do tell if
 60 you believe that any of the "fixes" are really new bugs.

62 Finally, thanks to our loyal users; indeed if you enjoy Xy-pic then
 63 please rate us on <http://sourceforge.net/projects/xy-pic> where Xy-pic
 64 development is now completely in the open!

66 -----
 67 AVAILABILITY
 68 -----

70 Xy-pic can be retrieved through the World Wide Web Xy-pic 'home page':
 72 <http://xy-pic.sourceforge.net>

74 Make sure to check that you have reached a version 3.8 copy (some
 75 archives take a while to mirror the latest files)!

77 -----
 78 HISTORY & CREDITS
 79 -----

26 Copyright (c) 1994-2010 Ross Moore <ross.moore@mq.edu.au>

28 The Xy-pic package is free software; you can redistribute it and/or
 29 modify it under the terms of the GNU General Public License as
 30 published by the Free Software Foundation; either version 2 of the
 31 License, or (at your option) any later version.

33 The Xy-pic package is distributed in the hope that it will be
 34 useful, but WITHOUT ANY WARRANTY; without even the implied warranty
 35 of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU
 36 General Public License for more details.

38 You should have received a copy of the GNU General Public License
 39 along with this package; if not, see <http://www.gnu.org/licenses/>.

41 What this means is that if you install Xy-pic then you should (1) make
 42 sure that the file 'COPYING' is accessible to the users, and (2) be
 43 prepared to provide Xy-pic (including sources including of your
 44 modifications) to any of your users that request it (you may charge a
 45 fee for this if you are so inclined).

47 Note: Some option files may be copyrighted by other people and use a
 48 different (more relaxed) license but the conditions remain the same
 49 for the entirety of Xy-pic.

52 -----
 53 -2- OVERVIEW OF FILES AND WHERE THEY SHOULD BE INSTALLED
 54 -----

56 In this section we explain in 10 steps where the different groups of
 57 Xy-pic files in the 'run' and 'doc' distribution should be installed.
 58 For each file category we indicate the location recommended by TDS,
 59 the TeX Directory Standard (as formed by a TUG working group of that
 60 name).

63 IMPORTANT

64 -----

65 If you have an older system (more than 10 years) then these
 66 instructions may not be suitable. Go to the source directory
 67 <http://xy-pic.cvs.sourceforge.net/viewvc/xy-pic/src/Historic/>
 68 where we keep some older instructions, or ask on the mailing list.

71 Step 1. Availability & License

72 -----

73 These eight files contain general information and should be installed
 74 in a publicly readable place:

76	README	generic information on Xy-pic
77	CATALOG	version information and summary
78	TRAILER	announcement and availability
79	INSTALL	how to install (this file)
80	MANIFEST	list of all files
81	VERSIONS	the RCS version ids of all source files
82	COPYING	GNU General Public License
83	FONTCOPYING	Special license for fonts

84 Xy-pic.html HTML source of Xy-pic home page
85 Xy-logo.png Xy-pic logo (gotta have one of those)
87 TDS directory: texmf/doc/generic/xypic

90 Step 2. Macros
91 -----
92 Files 'texinputs/*' are TeX and LaTeX macro files that must be
93 installed in a place which TeX and LaTeX will search (e.g., with un*x
94 TeX, a directory users include in the TEXINPUTS environment variable).
96 TDS directory: texmf/tex/generic/xypic

99 Step 3. TeX Font Metric
100 -----
101 Files 'texfonts/*.tfm' should be installed in a directory that TeX
102 will search for fonts (e.g., with un*x TeX, a directory users include
103 in the TEXFONTS environment variable).
105 TDS directory: texmf/fonts/tfm/public/xypic

108 Step 4. METAFONT Sources
109 -----
110 Files 'mfinputs/*.mf' should be installed in some directory where the
111 METAFONT program will search for them (e.g., with un*x TeX, a
112 directory included in the MFINPUTS environment variable).
114 NOTE: The METAFONT source files are only useful on installations where
115 the printer driver and previewer can utilise them to generate the
116 required bitmap fonts 'on-line'. If this is possible on your
117 installation then please use it: it saves substantial amounts of space
118 and means that you will automatically use fonts optimised for each
119 printer (provided evrything is correctly set up, of course).
121 TDS directory: texmf/fonts/source/public/xypic

124 Step 5. PostScript Type1 Fonts
125 -----
126 Files 'type1/*.pfb' contain versions of the Xy-pic fonts in special
127 PostScript form that may be useful on some installations. They should
128 be installed where the applications using them look for such fonts (if
129 used with DVIPS then the 'ps/xypic.map' file from the next group
130 should also be installed).
132 NOTE: Some installations, notably teTeX 0.4, will PREFER using these
133 fonts over the METAFONT-generated equivalents (IMHO this is a bug in
134 the MakeTeXPK script). On those systems we recommend that you ALSO
135 install the PK fonts to circumvent the problem.
137 IMPORTANT: Make sure that you do not have any old Xy-pic PostScript
138 'xy*.pfa' fonts floating around in your system - search for and remove
139 all files named 'xy*.pfa' when you have installed the new fonts. One
140 common way old (and wrong) fonts is manifest is when some arrowheads
141 appear skewed or too thin.
143 TDS directory: texmf/fonts/type1/public/xypic

146 Step 6. PostScript Font Metric Files

147 -----

149 Files 'pfm/*.pfm' are special files for some font handling software.

150 Install them if you need them.

152 TDS directory (usually): texmf/fonts/pfm/public/xypic

155 Step 7. Adobe Font Metric Files

156 -----

157 Files 'afm/*.afm' are special files for the Adobe Type Manager.

158 Install them if you need them.

160 TDS directory (usually): texmf/fonts/afm/public/xypic

163 Step 8. PostScript Header Files

164 -----

165 Files 'ps/*' contain PostScript header files. If you plan to use
 166 the PostScript extension option then you should copy these files to a
 167 place where your PostScript DVI driver will find them.

169 TDS directory (usually): texmf/dvips/xypic

172 Step 9. PostScript Font Map Files

173 -----

174 Files 'map/*' contain PostScript and PDF font mappings that link each
 175 font to the used encoding.

177 TDS directory (usually): texmf/fonts/map/dvips/xypic

180 Step 10. PDF Font Encoding Files

181 -----

182 Files 'enc/*' contain PDF encoding files (that name each character in
 183 the special Xy-pic fonts). If you plan to use the PDF backend then
 184 you should copy these files to a place where PDFTeX will find them.

186 TDS directory: texmf/fonts/enc/dvips/xypic

189 Step 11. Documentation

190 -----

191 The documentation is provided in Adobe PDF files.

193 doc/xyguide.pdf User's Guide for everyone.

194 doc/xyrefer.pdf Reference Manual for experienced users

196 The source code documentation is also included.

198 doc/xysource.pdf TeXnical documentation for TeXsperts

199 doc/xypdf.pdf TeXnical details about PDF generation

200 doc/xy*src.tar.gz the actual source files

202 TDS directory: texmf/doc/generic/xypic

205 That's all.

208 -----

209 -3- BUGS & COMMENTS & WHERE TO GET HELP

210 -----

212 We will appreciate reports on any problems you may encounter and
 213 opinions you have on how the usefulness of Xy-pic can be improved.
 214 Please report using either

216 Electronic mail (Internet): xy-pic@tug.org [preferred]

218 Paper mail: Kristoffer H. Rose
 219 IBM T.J.Watson Research Center
 220 P.O.Box 704
 221 Yorktown Heights, NY 10598
 222 USA

224 W3 <URL: <http://sourceforge.net/projects/xy-pic/>>

226 -----
 228 This is the end of INSTALL. We hope you'll enjoy Xy-pic!

230 -- Ross Moore and Kristoffer Rose

232 -----

D.3 Generation

These files are relevant when Xy-pic is generated from sources on a un*x system.

D.3.1 MAKE

1 **-*-text-*- \$Id: MAKE,v 3.11 2010/06/10 18:45:49 krisrose Exp \$**

3
 4 **=====**
 4 **MAKE: Xy-pic diagram typesetting package SOURCES**
 5 **=====**

7 Welcome to the source distribution of the Xy-pic macros for typesetting
 8 diagrams! Below you will find the following sections:

- 10 -1- License information
- 11 -2- Making the package and manual from sources
- 12 -3- Bugs & comments
- 13 -4- Distribution log

15 Please see the file 'README' for a summary of features 'TRAILER' for how
 16 you can obtain the newest Xy-pic, and the various 'INSTALL' files if you
 17 have already retrieved pregenerated macros and fonts.

20 -----
 21 -1- LICENSE INFORMATION
 22 -----

24 The Xy-pic package is licensed under 'GNU CopyLeft':

26 Xy-pic: Typesetting graphs and diagrams with TeX.
 27 Copyright (c) 1991-2010 Kristoffer H. Rose <krisrose@tug.org>

29 The Xy-pic macro package is free software; you can redistribute it
 30 and/or modify it under the terms of the GNU General Public License as
 31 published by the Free Software Foundation; either version 2 of the
 32 License, or (at your option) any later version.

34 The Xy-pic macro package is distributed in the hope that it will be
 35 useful, but WITHOUT ANY WARRANTY; without even the implied warranty of
 36 MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU
 37 General Public License for more details.

39 You should have received a copy of the GNU General Public License
 40 along with this package; if not, see <http://www.gnu.org/licenses/>.

42 (Some options may be copyright by other people but the conditions remain
 43 the same).

45 The full text of the GNU General Public License is supplied with Xy-pic
 46 in the file 'COPYING' and reproduced in the source documentation.

48 As a special provision, the FONTS provided with Xy-pic are provided
 49 under a much more relaxed license to avoid any risk that documents
 50 where the fonts are embedded are themselves covered by this copyright.

53 -----
 54 -2- MAKING THE PACKAGE AND MANUAL FROM SOURCES
 55 -----

57 NOTE FOR OTHER NON-UN*X USERS: If you do not have a un*x system then
 58 you are best advised to install as described in 'INSTALL'.

60 With a "TeX Live" installation - the common kind these days - the
 61 Makefile should work without any modifications.*

63 Go through the Makefile and check that everything is to your liking,
 64 then you can do the usual 'make' and 'make install' to install the
 65 package.

67 That is all.

69 * The source documentation, however, does requires a more complete
 70 CTAN installation.

73 -----
 74 -3- BUGS & COMMENTS
 75 -----

77 I will appreciate reports on any problems you may encounter and
 78 opinions you have on how the usefulness of Xy-pic can be improved.
 79 Please report using either

92 -----
 93 -4- DISTRIBUTION LOG
 94 -----

96 The following versions have been distributed publicly:
97
98 \$Log: MAKE,v \$
99 Revision 3.11 2010/06/10 18:45:49 krisrose
100 Reference to GPL by URL.

102 Revision 3.10 2010/05/13 23:26:49 krisrose
103 TeXnical documentation not included in standard package.

105 Revision 3.9 2010/05/06 17:46:29 krisrose
106 Ross Moore's e-mail address updated.
107 Many obsolete files degraded to Historic.

109 Revision 3.8 2010/04/25 21:48:05 krisrose
110 First proper integration of xypdf into Xy-pic "make dist".

112 Revision 3.7 2010/04/21 23:30:18 krisrose
113 Stable release. Font license exception added.

115 Revision 3.6 2010/04/16 06:06:51 krisrose
116 Preparing for a new release...

118 Revision 3.5 1997/05/28 22:40:26 krisrose
119 Fixed missing breaks bug.

121 Revision 3.3 1996/12/19 03:31:56 krisrose
122 Maintenance release

124 Revision 3.1 1995/09/05 20:31:32 kris
125 Releasing!

127 Revision 3.0 1995/07/07 20:14:21 kris
128 Major release w/new User's Guide!

130 Renamed to MAKE for version 3 source description.

132 Revision 2.12 1994/10/25 11:34:25 kris
133 Interim release just before v3 [works with AMS-LaTeX 1.2]...

135 Revision 2.11 1994/07/05 10:37:32 kris
136 Third 3beta release [bug fixes].
137 Experimental graph feature included (for ECCT-94 presentation).

139 Revision 2.10 1994/06/15 12:59:44 kris
140 Second 3beta release [bug fixes].

142 Revision 2.8 1994/04/11 09:31:09 kris
143 Second (bug fix) 3alpha release [corrected].

145 Revision 2.7 1994/03/08 02:06:01 kris
146 Release 3alpha.

148 MAJOR REWRITE of distribution to prepare for Xy-pic 3 functionality.
149 Curve extension code contributed by Ross Moore <ross.moore@mq.edu.au>;
150 support funding from MURG, ARC, and equipment from DEC.

152 Revision 2.6 1992/06/24 01:23:34 kris
153 Added 'hook' tips using new font xyqc10.
154 Added new POSitions: * and !.
155 Added triple lines \Ssolid, \Ddashed, \Ddotted, and companion \Ttip.
156 Reorganised manual.

```

158 Revision 2.5 1992/02/24 03:30:54 kris
159 Fixed bugs in \Direction calculation logic...
160 Added (FACTOR) to \rotate to allow arbitrary rotation.
161 ' intermediate points now accept an optional /RADIUS argument.
162 Added \Tip with wide tip.

164 Revision 2.4 1992/01/22 02:15:10 kris
165 Fixed bugs [with thanks]:
166 \\ works with AMS-LaTeX: don't use \Let@ [Werner Struckmann/Darrel Hankerson]
167 No spurious arrow heads with LaTeX: \pit now undefined [Werner Struckmann]
168 \Solid works: sets \Density [Dave Bowen]
169 Short diagonal lines work...major rewrite of \connectv@ [Eric Domenjoud]

171 Revision 2.3 1992/01/10 21:38:27 kris
172 Several bugs fixed [with thanks]:
173 The \ddtoX and \uutoX arrows were interchanged [Nico Verwer].
174 Some diagonal lines were wrong [Eric Domenjoud].
175 AMS-LaTeX users had name clash problems [Werner Struckmann].
176 The installation instructions in the Makefile were buggy [Leen Torenvliet].

178 Revision 2.2 1992/01/09 04:05:40 kris
179 Patched to fix problem with \text and support AMS-LaTeX.

181 Revision 2.1 1992/01/02 14:54:07 kris
182 Release version.

184 Revision 1.40 1991/12/17 04:53:23 kris
185 Version distributed as 'final draft' on Usenet.

187 -----
189 This is the end of the source overview. I hope you will enjoy Xy-pic!

45
46 ##### CONFIGURATION SECTION #####
47
48 # Please configure as instructed below for each of the DIRECTORIES, FONTS,
49 # and PROGRAMS parts by editing the definitions to fit your system.
50
51 ##### DIRECTORIES.
52 #
53 # The following variables define the directories where the various parts of
54 # Xy-pic should be installed.
55 #
56 # You should *EITHER* set TDSROOT to the root of a TDS-compliant directory
57 # tree, usually named ../texmf (if you have a TDS [TeX Directory Structure]
58 # compliant system then that is in fact all you need to do):
59 #
60 #
61 USR = /usr/local
62 TDSROOT = $(USR)/share/texmf
63 #
64 # *OR* you should set each of the following variables right for you system
65 # (do this if your setup does not match TDS exactly):
66 #
67 TEXINPUTDIR = $(TDSROOT)/tex/generic/xy-pic
```

```

68 TEXFONTDIR = $(TDSROOT)/fonts/tfm/public/xypic
69 TEXDOCDIR = $(TDSROOT)/doc/generic/xypic
70 MFINPUTDIR = $(TDSROOT)/fonts/source/public/xypic
71 TYPE1DIR = $(TDSROOT)/fonts/type1/public/xypic
72 PFMDIR = $(TDSROOT)/fonts/pfm/public/xypic
73 AFMDIR = $(TDSROOT)/fonts/afm/public/xypic
74 PSHEADERDIR = $(TDSROOT)/ps/xypic
75 #
76 # FONDIR is the directory where bitmap fonts are stored and is special
77 # (If you do not plan to install bitmap fonts because they are automatically
78 # generated and remember to set the MAGS variable below to '.' then you may
79 # ignore this step.)
80 #
81 # Since the location of individual fonts sometimes depend on properties of
82 # the font, you can insert
83 #
84 #     $$\{dpi\}           for the font resolution in 'Dots Per Inch' (NOT the
85 #                         device resolution---that should be inserted directly)
86 #
87 #     $$\{mode\}         for the METAFONT 'mode' used to generate the font
88 #
89 # ---what these get set to depends on the next section.
90 #
91 # For example, if you set FONDIR=/usr/lib/tex/pk$$\{dpi\} and decide in the
92 # next section to generate PK fonts at 300 dpi using a generic mode
93 # (localfont) then you get files named /usr/lib/tex/pk300/xy*.300pk.
94 #
95 # If your installation still uses the (inefficient) principle of having all
96 # PK files in the same directory as the TFM files then you should just set
97 # FONDIR=$(TEXFONTDIR).
98 #
99 FONDIR = $(TDSROOT)/fonts/pk/$$\{mode\}/public/xypic/dpi$$\{dpi\}
101 ##### FONTS.
102 #
103 # The METAFONT program needs to know the 'mode' of your printer in order to
104 # be able to generate correct fonts for it. On most installations the mode
105 # 'localfont' is made synonymous with the mode required for the default
106 # printer; in that case you can just pick the 'MODES = localfont' line. If
107 # this is not the case -- or you need fonts for several output devices---then
108 # you will have to consult the local METAFONT guide/guru to inquire what
109 # modes are used at your site. A good place to look for the modes used is in
110 # the MakeTeXPK script found on some sites.
111 #
112 # Set MODES to the list of printers you wish to use:
113 #
114 MODES = localfont
115 #MODES = cx ljfour
116 #
117 # You should also decide which TeX \magsteps you wish the font to be

```

```
118 # generated at.
119 #
120 # The default is . (dot) which prevents installation of any bitmaps because
121 # most modern installations generate them automatically.
122 #
123 MAGS = .
124 #MAGS = 0
125 #MAGS = 0 0.5 1 2
127 ##### PROGRAMS.
128 #
129 # You don't have to edit the following lines unless you have a non-standard
130 # un*x system or un*x TeX installation...
131 #
132 SHELL = /bin/sh
133 #

190 # DOC2TEX <file>: output efficient .tex file from inefficient .doc <file> with
191 # inlined documentation [my favourite hack :-]. Removes all DOCMODE lines,
192 # leaving only things before the first and in DOCMODE(...DOCMODE) brackets;
193 # also removes all blank lines and comment lines.
194 #
195 # If it breaks your sed you can just set DOC2TEX to cat although that will
196 # make the installed macro files three times larger and the reading of them
197 # somewhat slower...so in that case you are probably better of getting the
198 # 'normal' distribution where this has already been done for you!
199 # If you are on a Windows system or otherwise adventurous then you can also
200 # try the included "doc2tex.com" script contributed by R.Gaertner.
201 #
