

# Package ‘cola’

April 15, 2020

**Type** Package

**Title** A Framework for Consensus Partitioning

**Version** 1.2.1

**Date** 2019-12-31

**Author** Zuguang Gu

**Maintainer** Zuguang Gu <z.gu@dkfz.de>

**Depends** R (>= 3.6.0)

**Imports** grDevices, graphics, grid, stats, utils, ComplexHeatmap (>= 2.0.0), matrixStats, GetoptLong, circlize (>= 0.4.7), GlobalOptions (>= 0.1.0), clue, parallel, RColorBrewer, cluster, skmeans, png, mclust, crayon, methods, xml2, microbenchmark, httr, knitr, markdown, digest, impute, brew, Rcpp (>= 0.11.0), BiocGenerics, eulerr

**Suggests** genefilter, mvtnorm, testthat (>= 0.3), data.tree, dendextend, samr, pamr, kohonen, NMF, WGCNA, Rtsne, umap, clusterProfiler, ReactomePA, DOSE, AnnotationDbi, gplots, hu6800.db

**Description** Subgroup classification is a basic task in genomic data analysis, especially for gene expression and DNA methylation data analysis. It can also be used to test the agreement to known clinical annotations, or to test whether there exist significant batch effects. The cola package provides a general framework for subgroup classification by consensus partitioning. It has the following features: 1. It modularizes the consensus partitioning processes that various methods can be easily integrated. 2. It provides rich visualizations for interpreting the results. 3. It allows running multiple methods at the same time and provides functionalities to compare results straightforwardly. 4. It provides a new method to extract features which are more efficient to separate subgroups. 5. It generates detailed reports for the complete analysis.

---

adjust_matrix	<i>Remove rows with low variance and impute missing values</i>
---------------	--

---

### Description

Remove rows with low variance and impute missing values

### Usage

```
adjust_matrix(m, sd_quantile = 0.05, max_na = 0.25)
```

### Arguments

m	A numeric matrix.
sd_quantile	Cutoff of the quantile of standard deviation. Rows with standard deviation less than it are removed.
max_na	Maximum NA fraction in each row. Rows with NA fraction larger than it are removed.

### Details

The function uses [impute.knn](#) to impute missing values, then uses [adjust\\_outlier](#) to adjust outliers and removes rows with low standard deviations.

### Value

A numeric matrix.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
m = matrix(rnorm(200), 10)
rownames(m) = letters[1:10]
m[1, 1] = 1000
range(m)
m2 = adjust_matrix(m)
range(m2)
```

---

adjust_outlier	<i>Adjust outliers</i>
----------------	------------------------

---

**Description**

Adjust outliers

**Usage**

```
adjust_outlier(x, q = 0.05)
```

**Arguments**

x	A numeric vector.
q	Quantile to adjust.

**Details**

Values larger than quantile  $1 - q$  are adjusted to the  $1 - q$  quantile and values smaller than quantile  $q$  are adjusted to the  $q$  quantile.

**Value**

A numeric vector with same length as the original one.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
x = rnorm(10)
x[1] = 100
adjust_outlier(x)
```

---

all\_partition\_methods *All supported partition methods*

---

**Description**

All supported partition methods

**Usage**

```
all_partition_methods()
```

**Details**

New partition methods can be registered by [register\\_partition\\_methods](#).

**Value**

A vector of supported partition methods.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
all_partition_methods()
```

---

all\_top\_value\_methods *All supported top-value methods*

---

**Description**

All supported top-value methods

**Usage**

```
all_top_value_methods()
```

**Details**

New top-value methods can be registered by [register\\_top\\_value\\_methods](#).

**Value**

A vector of supported top-value methods.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
all_top_value_methods()
```

---

aPAC

*Adapted PAC scores*

---

### Description

Adapted PAC scores

### Usage

```
aPAC(consensus_mat)
```

### Arguments

consensus\_mat A consensus matrix.

### Details

For the consensus values  $x$ , it is transformed to  $1 - x$  if  $x < 0.5$ . After the transformation, for any pair of samples in the consensus matrix, If they are always in a same group or always in different groups, the value  $x$  is both to 1. Thus, if the consensus matrix shows stable partitions, values  $x$  will be all close to 1. Reflected in the CDF of  $x$ , the curve is shifted to the right and the area under CDF curve should be very small.

An aPAC value less than 0.05 is considered as the stable partition, which can be thought the proportion of ambiguous partitioning is less than 0.05.

### Value

A numeric value.

### Examples

```
data(co1a_r1)
aPAC(get_consensus(co1a_r1[1, 1], k = 2))
aPAC(get_consensus(co1a_r1[1, 1], k = 3))
aPAC(get_consensus(co1a_r1[1, 1], k = 4))
aPAC(get_consensus(co1a_r1[1, 1], k = 5))
aPAC(get_consensus(co1a_r1[1, 1], k = 6))
```

---

ATC

*Ability to correlate other rows in the matrix*

---

### Description

Ability to correlate other rows in the matrix

### Usage

```
ATC(mat, cor_fun = stat::cor, min_cor = 0, power = 1,
     mc.cores = 1, n_sampling = 1000, q_sd = 0, group = NULL, ...)
```

**Arguments**

<code>mat</code>	A numeric matrix. ATC score is calculated by rows.
<code>cor_fun</code>	A function which calculates correlations.
<code>min_cor</code>	Cutoff for the minimal absolute correlation.
<code>power</code>	Power on the correlation values.
<code>mc.cores</code>	Number of cores.
<code>n_sampling</code>	When there are too many rows in the matrix, to get the cumulative distribution of how one row correlates other rows, actually we don't need to use all the rows in the matrix, e.g. 1000 rows can already give a very nice estimation.
<code>q_sd</code>	Percentile of the standard deviation for the rows. Rows with values less than it are ignored.
<code>group</code>	A categorical variable. If it is specified, the correlation is only calculated for the features in the same group.
<code>...</code>	Pass to <code>cor_fun</code> .

**Details**

For a given row in a matrix, the ATC score is the area above the curve of the cumulative density distribution of the absolute correlation to all other rows. Formally, if  $F_i(X)$  is the cumulative distribution function of  $X$  where  $X$  is the absolute correlation for row  $i$  with power  $power$  (i.e.  $x = cor^{power}$ ),  $ATC_i = 1 - \int_{min\_cor}^1 F_i(X)$ .

By default the ATC scores are calculated by Pearson correlation, to use Spearman correlation, you can register the top-value method by:

```
register_top_value_methods(
  "ATC_spearman" = function(m) ATC(m, method = "spearman")
)
```

Similarly, to use a robust correlation method, e.g. `bicor` function, you can do like:

```
register_top_value_methods(
  "ATC_bicor" = function(m) ATC(m, cor_fun = WGCNA::bicor)
)
```

**Value**

A vector of numeric values with the same order as rows in the input matrix.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
set.seed(12345)
nr1 = 100
mat1 = matrix(rnorm(100*nr1), nrow = nr1)

nr2 = 10
require(mvtnorm)
```

```
sigma = matrix(0.8, nrow = nr2, ncol = nr2); diag(sigma) = 1
mat2 = t(rmvnorm(100, mean = rep(0, nr2), sigma = sigma))

nr3 = 50
sigma = matrix(0.5, nrow = nr3, ncol = nr3); diag(sigma) = 1
mat3 = t(rmvnorm(100, mean = rep(0, nr3), sigma = sigma))

mat = rbind(mat1, mat2, mat3)
ATC_score = ATC(mat)
plot(ATC_score, pch = 16, col = c(rep(1, nr1), rep(2, nr2), rep(3, nr3)))
```

---

cola

*A bottle of cola*

---

### Description

A bottle of cola

### Usage

```
cola()
```

### Details

Simply serve you a bottle of cola.

The ASCII art is from <http://ascii.co.uk/art/coke>.

### Value

No value is returned.

### Author(s)

Zuguang Gu <z.gu@dkfz.de>

### Examples

```
for(i in 1:10) cola()
```

---

cola\_opt

*Global Parameters*

---

### Description

Global Parameters

### Usage

```
cola_opt(..., RESET = FALSE, READ.ONLY = NULL, LOCAL = FALSE, ADD = FALSE)
```

**Arguments**

...	Arguments for the parameters, see "details" section
RESET	reset to default values
READ.ONLY	please ignore
LOCAL	please ignore
ADD	please ignore

**Details**

There are following global parameters:

group\_diff Used in [get\\_signatures, ConsensusPartition-method](#).

fdr\_cutoff Used in [get\\_signatures, ConsensusPartition-method](#).

color\_set\_2 Colors for the predicted classes.

**Examples**

```
cola_opt
cola_opt$group_diff = 0.2 # e.g. for methylation datasets
cola_opt$fdr_cutoff = 0.1 # e.g. for methylation datasets
cola_opt
cola_opt(RESET = TRUE)
```

---

cola\_report-ConsensusPartition-method

*Make HTML report from the ConsensusPartition object*

---

**Description**

Make HTML report from the ConsensusPartition object

**Usage**

```
## S4 method for signature 'ConsensusPartition'
cola_report(object, output_dir = getwd(),
  title = qq("cola Report for Consensus Partitioning (@{object@top_value_method}):@{object@partition}"),
  env = parent.frame())
```

**Arguments**

object	A <a href="#">ConsensusPartition-class</a> object.
output_dir	The output directory where the report is saved.
title	Title of the report.
env	Where the objects in the report are found, internally used.

**Details**

It generates report for a specific combination of top-value method and partition method.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**See Also**

[cola\\_report](#), [ConsensusPartitionList-method](#)

**Examples**

```
# There is no example
NULL
```

---

cola\_report-ConsensusPartitionList-method

*Make HTML report from the ConsensusPartitionList object*

---

**Description**

Make HTML report from the ConsensusPartitionList object

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'
cola_report(object, output_dir = getwd(), mc.cores = 1,
            title = "cola Report for Consensus Partitioning", env = parent.frame())
```

**Arguments**

object	A <a href="#">ConsensusPartitionList-class</a> object.
output_dir	The output directory where the report is saved.
mc.cores	Multiple cores to use.
title	Title of the report.
env	Where the objects in the report are found, internally used.

**Details**

The [ConsensusPartitionList-class](#) object contains results for all top-value methods and all partition methods. This function generates a HTML report which contains all plots and tables for every combination of top-value method and partition method.

The report generation may take a while because it generates A LOT of heatmaps.

Examples of reports can be found at [https://jokergoo.github.io/cola\\_examples/](https://jokergoo.github.io/cola_examples/)

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
## Not run:
data(cola_rl)
cola_report(cola_rl[c("sd", "MAD"), c("hclust", "skmeans")], output_dir = "~/test_cola_cl_report")

## End(Not run)
```

---

cola\_report-dispatch    *Method dispatch page for cola\_report*

---

**Description**

Method dispatch page for cola\_report.

**Dispatch**

cola\_report can be dispatched on following classes:

- [cola\\_report,ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [cola\\_report,ConsensusPartition-method, ConsensusPartition-class](#) class method

**Examples**

```
# no example
NULL
```

---

cola\_rl                    *Example ConsensusPartitionList object*

---

**Description**

Example ConsensusPartitionList object

**Usage**

```
data(cola_rl)
```

**Details**

Following code was used to generate cola\_rl:

```
set.seed(123)
m = cbind(rbind(matrix(rnorm(20*20, mean = 1, sd = 0.5), nr = 20),
                    matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20),
                    matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20)),
          rbind(matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20),
                    matrix(rnorm(20*20, mean = 1, sd = 0.5), nr = 20),
                    matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20)),
          rbind(matrix(rnorm(20*20, mean = 0.5, sd = 0.5), nr = 20),
                    matrix(rnorm(20*20, mean = 0.5, sd = 0.5), nr = 20),
                    matrix(rnorm(20*20, mean = 1, sd = 0.5), nr = 20))
          ) + matrix(rnorm(60*60, sd = 0.5), nr = 60)
cola_rl = run_all_consensus_partition_methods(data = m, top_n = c(20, 30, 40))
```

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(cola_rl)
cola_rl
```

---

collect\_classes-ConsensusPartition-method

*Collect classes from ConsensusPartition object*

---

**Description**

Collect classes from ConsensusPartition object

**Usage**

```
## S4 method for signature 'ConsensusPartition'
collect_classes(object, internal = FALSE, show_row_names = FALSE,
               anno = get_anno(object), anno_col = get_anno_col(object))
```

**Arguments**

object	A <a href="#">ConsensusPartition-class</a> object.
internal	Used internally.
show_row_names	Whether show row names in the heatmap (which is the column name in the original matrix).
anno	A data frame of annotations for the original matrix columns. By default it uses the annotations specified in <a href="#">consensus_partition</a> or <a href="#">run_all_consensus_partition_methods</a> .
anno_col	A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.

**Details**

The percent membership matrix and the class IDs for each k are plotted in the heatmaps.

Same row in all heatmaps corresponds to the same column in the original matrix.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(cola_rl)
collect_classes(cola_rl["sd", "kmeans"])
```

---

collect\_classes-ConsensusPartitionList-method

*Collect classes from ConsensusPartitionList object*

---

**Description**

Collect classes from ConsensusPartitionList object

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'
collect_classes(object, k, show_column_names = FALSE,
               anno = get_anno(object), anno_col = get_anno_col(object), ...)
```

**Arguments**

object	A <a href="#">ConsensusPartitionList-class</a> object returned by <a href="#">run_all_consensus_partition_methods</a> .
k	Number of partitions.
show_column_names	Whether show column names in the heatmap (which is the column name in the original matrix).
anno	A data frame of annotations for the original matrix columns. By default it uses the annotations specified in <a href="#">run_all_consensus_partition_methods</a> .
anno_col	A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.
...	Pass to <a href="#">draw_HeatmapList-method</a> .

## Details

There are following panels in the plot:

- a heatmap showing partitions predicted from all methods where the top annotation is the consensus partition summarized from partitions from all methods, weighted by mean silhouette scores in every single method.
- a row barplot annotation showing the mean silhouette scores for different methods.

The row clustering is applied on the dissimilarity matrix calculated by `cl_dissimilarity` with the comembership method.

The brightness of the color corresponds to the silhouette scores for the consensus partition in each method.

## Value

No value is returned.

## Author(s)

Zuguang Gu <z.gu@dkfz.de>

## Examples

```
data(coala_r1)
collect_classes(coala_r1, k = 3)
```

---

collect\_classes-dispatch

*Method dispatch page for collect\_classes*

---

## Description

Method dispatch page for collect\_classes.

## Dispatch

collect\_classes can be dispatched on following classes:

- `collect_classes,ConsensusPartitionList-method,ConsensusPartitionList-class` class method
- `collect_classes,ConsensusPartition-method,ConsensusPartition-class` class method

## Examples

```
# no example
NULL
```

---

collect\_plots-ConsensusPartition-method  
*Collect plots from ConsensusPartition object*

---

## Description

Collect plots from ConsensusPartition object

## Usage

```
## S4 method for signature 'ConsensusPartition'  
collect_plots(object, verbose = TRUE)
```

## Arguments

object	A <a href="#">ConsensusPartition-class</a> object.
verbose	Whether print messages.

## Details

Plots by [plot\\_ecdf](#), [collect\\_classes](#), [ConsensusPartition-method](#), [consensus\\_heatmap](#), [membership\\_heatmap](#) and [get\\_signatures](#) are arranged in one single page, for all available k.

## Value

No value is returned.

## Author(s)

Zuguang Gu <z.gu@dkfz.de>

## See Also

[collect\\_plots](#), [ConsensusPartitionList-method](#) collects plots for the [ConsensusPartitionList-class](#) object.

## Examples

```
## Not run:  
data(coala_r1)  
collect_plots(coala_r1["sd", "kmeans"])  
  
## End(Not run)
```

---

collect\_plots-ConsensusPartitionList-method

*Collect plots from ConsensusPartitionList object*

---

### Description

Collect plots from ConsensusPartitionList object

### Usage

```
## S4 method for signature 'ConsensusPartitionList'  
collect_plots(object, k = 2, fun = consensus_heatmap,  
              top_value_method = object@top_value_method,  
              partition_method = object@partition_method,  
              verbose = TRUE, mc.cores = 1, ...)
```

### Arguments

object	A <a href="#">ConsensusPartitionList-class</a> object from <a href="#">run_all_consensus_partition_methods</a> .
k	Number of partitions.
fun	Function used to generate plots. Valid functions are <a href="#">consensus_heatmap</a> , <a href="#">plot_ecdf</a> , <a href="#">membership_heatmap</a> , <a href="#">get_signatures</a> and <a href="#">dimension_reduction</a> .
top_value_method	A vector of top-value methods.
partition_method	A vector of partition methods.
verbose	Whether to print message.
mc.cores	Number of cores. On OSX it is enforced to be 1.
...	other Arguments passed to corresponding fun.

### Details

Plots for all combinations of top-value methods and partition methods are arranged in one single page.

This function makes it easy to directly compare results from multiple methods.

### Value

No value is returned.

### Author(s)

Zuguang Gu <z.gu@dkfz.de>

### See Also

[collect\\_plots, ConsensusPartition-method](#) collects plots for a single [ConsensusPartition-class](#) object.

**Examples**

```

data(cola_r1)
collect_plots(cola_r1, k = 3)
## Not run:
collect_plots(cola_r1, k = 3, fun = membership_heatmap)
collect_plots(cola_r1, k = 3, fun = get_signatures)

## End(Not run)

```

---

collect\_plots-dispatch

*Method dispatch page for collect\_plots*

---

**Description**

Method dispatch page for collect\_plots.

**Dispatch**

collect\_plots can be dispatched on following classes:

- [collect\\_plots, ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [collect\\_plots, ConsensusPartition-method, ConsensusPartition-class](#) class method

**Examples**

```

# no example
NULL

```

---

collect\_stats-ConsensusPartition-method

*Draw and compare statistics for a single method*

---

**Description**

Draw and compare statistics for a single method

**Usage**

```

## S4 method for signature 'ConsensusPartition'
collect_stats(object, ...)

```

**Arguments**

object            A [ConsensusPartition-class](#) object.  
...                Other arguments.

## Details

It is identical to [select\\_partition\\_number, ConsensusPartition-method](#).

## Examples

```
# There is no example
NULL
```

---

collect\_stats-ConsensusPartitionList-method

*Draw and compare statistics for multiple methods*

---

## Description

Draw and compare statistics for multiple methods

## Usage

```
## S4 method for signature 'ConsensusPartitionList'
collect_stats(object, k, layout_nrow = 2, all_stats = FALSE, ...)
```

## Arguments

object	A <a href="#">ConsensusPartitionList-class</a> object.
k	Number of partitions
layout_nrow	Number of rows in the layout
all_stats	Whether to show all statistics that were calculated. Used internally.
...	Other arguments

## Details

It draws heatmaps for statistics for multiple methods in parallel, so that users can compare which combination of methods gives the best results with given the number of partitions.

## Examples

```
data(cola_r1)
collect_stats(cola_r1, k = 3)
```

collect\_stats-dispatch

*Method dispatch page for collect\_stats*

---

### Description

Method dispatch page for collect\_stats.

### Dispatch

collect\_stats can be dispatched on following classes:

- [collect\\_stats, ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [collect\\_stats, ConsensusPartition-method, ConsensusPartition-class](#) class method

### Examples

```
# no example  
NULL
```

---

colnames-ConsensusPartition-method

*Column names of the matrix*

---

### Description

Column names of the matrix

### Usage

```
## S4 method for signature 'ConsensusPartition'  
colnames(x)
```

### Arguments

x                    A [ConsensusPartition-class](#) object.

### Examples

```
# There is no example  
NULL
```

---

colnames-ConsensusPartitionList-method  
*Column names of the matrix*

---

**Description**

Column names of the matrix

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'  
colnames(x)
```

**Arguments**

x                    A [ConsensusPartitionList-class](#) object.

**Examples**

```
# There is no example  
NULL
```

---

colnames-dispatch      *Method dispatch page for colnames*

---

**Description**

Method dispatch page for colnames.

**Dispatch**

colnames can be dispatched on following classes:

- [colnames, ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [colnames, ConsensusPartition-method, ConsensusPartition-class](#) class method

**Examples**

```
# no example  
NULL
```

---

compare\_signatures-ConsensusPartition-method  
*Compare Signatures from Different k*

---

### Description

Compare Signatures from Different k

### Usage

```
## S4 method for signature 'ConsensusPartition'
compare_signatures(object, k = object@k, ...)
```

### Arguments

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of partitions. Value should be a vector.
...	Other arguments passed to <a href="#">get_signatures,ConsensusPartition-method</a> .

### Details

It plots an Euler diagram showing the overlap of signatures from different k.

### Examples

```
# There is no example
NULL
```

---

concordance                      *Concordance to the consensus partition*

---

### Description

Concordance to the consensus partition

### Usage

```
concordance(membership_each, class)
```

### Arguments

membership_each	A matrix which contains partitions in every single runs where columns correspond to runs.
class	Consensus class IDs.

## Details

Note class IDs in `membership_each` should already be adjusted to the consensus class IDs to let `sum(x_single == x_consensus)` reach maximum.

The concordance score is the mean proportion of samples having the same class ID as the consensus class ID among runs.

This function is used internally.

## Value

A numeric value.

## Author(s)

Zuguang Gu <z.gu@dkfz.de>

## Examples

```
data(coLa_r1)
membership_each = get_membership(coLa_r1["sd", "kmeans"], each = TRUE, k = 3)
consensus_classes = get_classes(coLa_r1["sd", "kmeans"], k = 3)$class
concordance(membership_each, consensus_classes)
```

---

ConsensusPartition-class

*The ConsensusPartition class*

---

## Description

The ConsensusPartition class

## Methods

The [ConsensusPartition-class](#) has following methods:

[consensus\\_partition](#), [ConsensusPartition-method](#): constructor method, run consensus partition with a specified top-value method and a partition method.

[select\\_partition\\_number](#), [ConsensusPartition-method](#): make a list of plots to select optimized number of partitions.

[consensus\\_heatmap](#), [ConsensusPartition-method](#): make heatmap of the consensus matrix.

[membership\\_heatmap](#), [ConsensusPartition-method](#): make heatmap of the membership in every random sampling.

[get\\_signatures](#), [ConsensusPartition-method](#): get the signature rows and make heatmap.

[dimension\\_reduction](#), [ConsensusPartition-method](#): make dimension reduction plots.

[collect\\_plots](#), [ConsensusPartition-method](#): make heatmaps for consensus matrix and membership matrix with different number of partitions.

[collect\\_classes](#), [ConsensusPartition-method](#): make heatmap of classes with different numbers of partitions.

[get\\_param](#), [ConsensusPartition-method](#): get parameters for the consensus clustering.

[get\\_matrix,ConsensusPartition-method](#): get the original matrix.  
[get\\_consensus,ConsensusPartition-method](#): get the consensus matrix.  
[get\\_membership,ConsensusPartition-method](#): get the membership in random samplings.  
[get\\_stats,ConsensusPartition-method](#): get metrics for the consensus clustering.  
[get\\_classes,ConsensusPartition-method](#): get the consensus class IDs and other columns.  
[suggest\\_best\\_k,ConsensusPartition-method](#): guess the best number of partitions.  
[test\\_to\\_known\\_factors,ConsensusPartition-method](#): test correlation between predicted classes and known factors, if available.  
[cola\\_report,ConsensusPartition-method](#): generate a HTML report for the whole analysis.  
[functional\\_enrichment,ConsensusPartition-method](#): perform functional enrichment analysis on significant genes if rows in the matrix can be corresponded to genes.

# There is no example
NULL
```

---

ConsensusPartitionList-class

*The ConsensusPartitionList class*

---

### Description

The ConsensusPartitionList class

### Details

The object contains results from all combinations of top-value methods and partition methods.

### Methods

The [ConsensusPartitionList-class](#) provides following methods:

[run\\_all\\_consensus\\_partition\\_methods](#): constructor method.  
[top\\_rows\\_overlap,ConsensusPartitionList-method](#): plot the overlaps of top rows under different top-value methods.  
[top\\_rows\\_heatmap,ConsensusPartitionList-method](#): plot the heatmap of top rows under different top-value methods.  
[get\\_classes,ConsensusPartitionList-method](#): get consensus class IDs merging from all methods.  
[get\\_matrix,ConsensusPartition-method](#): get the original matrix.  
[get\\_stats,ConsensusPartitionList-method](#): get metrics for a specified k.

[get\\_membership,ConsensusPartitionList-method](#): get consensus membership matrix summarized from all methods.

[suggest\\_best\\_k,ConsensusPartitionList-method](#): guess the best number of partitions for all methods.

[collect\\_plots,ConsensusPartitionList-method](#): collect plots from all combinations of top-value methods and partition methods with choosing a plotting function.

[collect\\_classes,ConsensusPartitionList-method](#): make a plot which contains predicted classes from all combinations of top-value methods and partition methods.

[test\\_to\\_known\\_factors,ConsensusPartitionList-method](#): test correlation between predicted classes and known annotations, if provided.

[cola\\_report,ConsensusPartitionList-method](#): generate a HTML report for the whole analysis.

[functional\\_enrichment,ConsensusPartitionList-method](#): perform functional enrichment analysis on significant genes if rows in the matrix can be corresponded to genes.

# There is no example
NULL
```

---

consensus\_heatmap-ConsensusPartition-method  
*Heatmap for the consensus matrix*

---

### Description

Heatmap for the consensus matrix

### Usage

```
## S4 method for signature 'ConsensusPartition'
consensus_heatmap(object, k, internal = FALSE,
  anno = get_anno(object), anno_col = get_anno_col(object),
  show_row_names = FALSE, ...)
```

**Arguments**

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of partitions.
internal	Used internally.
anno	A data frame of annotations for the original matrix columns. By default it uses the annotations specified in <a href="#">consensus_partition</a> or <a href="#">run_all_consensus_partition_methods</a> .
anno_col	A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.
show_row_names	Whether plot row names on the consensus heatmap (which are the column names in the original matrix)
...	other arguments

**Details**

For row  $i$  and column  $j$  in the consensus matrix, the value of corresponding  $x_{ij}$  is the probability of sample  $i$  and sample  $j$  being in a same group from all partitions.

There are following heatmaps from left to right:

- probability of the sample to stay in the corresponding group
- silhouette scores which measure the distance of an item to the second closest subgroups.
- predicted classes.
- consensus matrix.
- more annotations if provided as anno

One thing that is very important to note is that since we already know the consensus classes from consensus partition, in the heatmap, only rows or columns within the group is clustered.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(cola_rl)
consensus_heatmap(cola_rl["sd", "hclust"], k = 3)
```

---

consensus\_partition     *Consensus partition*

---

## Description

Consensus partition

## Usage

```
consensus_partition(data,
  top_value_method = "ATC",
  top_n = seq(min(1000, round(nrow(data)*0.1)),
    min(5000, round(nrow(data)*0.5)),
    length.out = 5),
  partition_method = "skmeans",
  max_k = 6,
  sample_by = "row",
  p_sampling = 0.8,
  partition_repeat = 50,
  partition_param = list(),
  anno = NULL,
  anno_col = NULL,
  scale_rows = NULL,
  verbose = TRUE,
  mc.cores = 1,
  .env = NULL)
```

## Arguments

data	A numeric matrix where subgroups are found by columns.
top_value_method	A single top-value method. Available methods are in <a href="#">all_top_value_methods</a> . Use <a href="#">register_top_value_methods</a> to add a new top-value method.
top_n	Number of rows with top values. The value can be a vector with length > 1. When n > 5000, the function only randomly sample 5000 rows from top n rows. If top_n is a vector, partition will be applied to every values in top_n and consensus partition is summarized from all partitions.
partition_method	A single partition method. Available methods are in <a href="#">all_partition_methods</a> . Use <a href="#">register_partition_methods</a> to add a new partition method.
max_k	Maximal number of partitions to try. The function will try 2:max_k partitions.
sample_by	Should randomly sample the matrix by rows or by columns?
p_sampling	Proportion of the submatrix which contains the top n rows to sample.
partition_repeat	Number of repeats for the random sampling.
partition_param	Parameters for the partition method which are passed to ... in a registered partition method. See <a href="#">register_partition_methods</a> for detail.

anno	A data frame with known annotation of samples. The annotations will be plotted in heatmaps and the correlation to predicted subgroups will be tested.
anno_col	A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.
scale_rows	Whether to scale rows. If it is TRUE, scaling method defined in <a href="#">register_partition_methods</a> is used.
verbose	Whether print messages.
mc.cores	Multiple cores to use.
.env	An environment, internally used.

### Details

The function performs analysis in following steps:

- calculate scores for rows by top-value method,
- for each top\_n value, take top n rows,
- randomly sample p\_sampling rows from the top\_n-row matrix and perform partitioning for partition\_repeats times,
- collect partitions from all partitions and calculate consensus partitions.

### Value

A [ConsensusPartition-class](#) object. Simply type object in the interactive R session to see which functions can be applied on it.

### Author(s)

Zuguang Gu <z.gu@dkfz.de>

### See Also

[run\\_all\\_consensus\\_partition\\_methods](#) runs consensus partition with multiple top-value methods and multiple partition methods.

### Examples

```
set.seed(123)
m = cbind(rbind(matrix(rnorm(20*20, mean = 1, sd = 0.5), nr = 20),
  matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20),
  matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20)),
  rbind(matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20),
  matrix(rnorm(20*20, mean = 1, sd = 0.5), nr = 20),
  matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20)),
  rbind(matrix(rnorm(20*20, mean = 0.5, sd = 0.5), nr = 20),
  matrix(rnorm(20*20, mean = 0.5, sd = 0.5), nr = 20),
  matrix(rnorm(20*20, mean = 1, sd = 0.5), nr = 20))
) + matrix(rnorm(60*60, sd = 0.5), nr = 60)
cp = consensus_partition(m, partition_repeat = 10, top_n = c(10, 20, 50))
cp
```

---

`correspond_between_rankings`*Correspond between a list of rankings*

---

**Description**

Correspond between a list of rankings

**Usage**

```
correspond_between_rankings(lt, top_n = length(lt[[1]]),  
  col = cola_opt$color_set_1[1:length(lt)], ...)
```

**Arguments**

<code>lt</code>	A list of scores under different metrics.
<code>top_n</code>	Top n elements to show correspondance.
<code>col</code>	A vector of colors for <code>lt</code> .
<code>...</code>	Pass to <a href="#">correspond_between_two_rankings</a> .

**Details**

It makes plots for every pairwise comparisons in `lt`.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
require(matrixStats)  
mat = matrix(runif(1000), ncol = 10)  
x1 = rowSds(mat)  
x2 = rowMads(mat)  
x3 = rowSds(mat)/rowMeans(mat)  
correspond_between_rankings(lt = list(sd = x1, mad = x2, vc = x3),  
  top_n = 20, col = c("red", "blue", "green"))
```

---

correspond\_between\_two\_rankings  
*Correspond two rankings*

---

## Description

Correspond two rankings

## Usage

```
correspond_between_two_rankings(x1, x2, name1, name2,  
  col1 = 2, col2 = 3, top_n = round(0.25*length(x1)), transparency = 0.9,  
  pt_size = unit(1, "mm"), newpage = TRUE, ratio = c(1, 1, 1))
```

## Arguments

x1	A vector of scores calculated by one metric.
x2	A vector of scores calculated by another metric.
name1	Name of the first metric.
name2	Name of the second metric.
col1	Color for the first metric.
col2	Color for the second metric.
top_n	Top n elements to show correspondance.
transparency	Transparency of the connection lines.
pt_size	Size of the points, must be a <a href="#">unit</a> object
newpage	Whether to plot in a new graphic page.
ratio	Ratio of width of the left barplot, connection lines and right barplot. The three values will be scaled to a sum of 1.

## Details

In x1 and x2, the  $i^{\text{th}}$  element is the same object (e.g. same row if they are calculated from a matrix) but with different scores under different metrics.

x1 and x2 are sorted in the left panel and right panel. The top n elements under corresponding metric are highlighted by vertical color lines in both panels. The left and right panels also show as barplots of the scores in the two metrics. Between the left and right panels, there are lines connecting the same element (e.g.  $i^{\text{th}}$  element in x1 and x2) in the two ordered vectors so that you can see how a same element has two different ranks in the two metrics.

Under the plot is a simple Venn diagram showing the overlaps of the top n elements by the two metrics.

## Value

No value is returned.

## Author(s)

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
require(matrixStats)
mat = matrix(runif(1000), ncol = 10)
x1 = rowSds(mat)
x2 = rowMads(mat)
correspond_between_two_rankings(x1, x2, name1 = "sd", name2 = "mad", top_n = 20)
```

---

dim.ConsensusPartition

*Dimension of the matrix*

---

**Description**

Dimension of the matrix

**Usage**

```
## S3 method for class 'ConsensusPartition'
dim(x)
```

**Arguments**

x                    A [ConsensusPartition-class](#) object.

**Examples**

```
# There is no example
NULL
```

---

dim.ConsensusPartitionList

*Dimension of the matrix*

---

**Description**

Dimension of the matrix

**Usage**

```
## S3 method for class 'ConsensusPartitionList'
dim(x)
```

**Arguments**

x                    A [ConsensusPartitionList-class](#) object.

**Examples**

```
# There is no example
NULL
```

---

 dimension\_reduction-ConsensusPartition-method

*Visualize column after dimension reduction*

---

## Description

Visualize samples (the matrix columns) after dimension reduction

## Usage

```
## S4 method for signature 'ConsensusPartition'
dimension_reduction(object, k, top_n = NULL,
  method = c("PCA", "MDS", "t-SNE", "UMAP"),
  control = list(),
  internal = FALSE, nr = 5000,
  silhouette_cutoff = 0.5, remove = FALSE,
  scale_rows = TRUE, verbose = TRUE, ...)
```

## Arguments

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of partitions.
top_n	Top n rows to use. By default it uses all rows in the original matrix.
method	Which method to reduce the dimension of the data. MDS uses <a href="#">cmdscales</a> , PCA uses <a href="#">prcomp</a> . t-SNE uses <a href="#">Rtsne</a> . UMAP uses <a href="#">umap</a> .
control	A list of parameters for <a href="#">Rtsne</a> or <a href="#">umap</a> .
internal	Internally used.
nr	If number of matrix rows is larger than this value, random nr rows are used.
silhouette_cutoff	Cutoff of silhouette score. Data points with values less than it will be mapped with cross symbols.
remove	Whether to remove columns which have less silhouette scores than the cutoff.
scale_rows	Whether perform scaling on matrix rows.
verbose	Whether print messages.
...	Other arguments.

## Value

No value is returned.

## Author(s)

Zuguang Gu <z.gu@dkfz.de>

data(coala_r1)
dimension_reduction(coala_r1["sd", "kmeans"], k = 3)
```

---

 dimension\_reduction-dispatch

*Method dispatch page for dimension\_reduction*

---

### Description

Method dispatch page for dimension\_reduction.

### Dispatch

dimension\_reduction can be dispatched on following classes:

- [dimension\\_reduction, matrix-method, matrix-class](#) class method
- [dimension\\_reduction, ConsensusPartition-method, ConsensusPartition-class](#) class method

### Examples

```
# no example
NULL
```

---

 dimension\_reduction-matrix-method

*Visualize columns after dimension reduction*

---

### Description

Visualize columns after dimension reduction

### Usage

```
## S4 method for signature 'matrix'
dimension_reduction(object,
  pch = 16, col = "black", cex = 1, main = "",
  method = c("PCA", "MDS", "t-SNE", "UMAP"),
  pc = NULL, control = list(),
  scale_rows = TRUE, nr = 5000,
  internal = FALSE, verbose = TRUE)
```

### Arguments

object	A numeric matrix.
method	Which method to reduce the dimension of the data. MDS uses <a href="#">cmdscales</a> , PCA uses <a href="#">prcomp</a> . t-SNE uses <a href="#">Rtsne</a> . UMAP uses <a href="#">umap</a> .
pc	Which two principle components to visualize
control	A list of parameters for <a href="#">Rtsne</a> or <a href="#">umap</a> .

pch	Shape of points.
col	Color of points.
cex	Size of points.
main	Title of the plot.
scale_rows	Whether perform scaling on matrix rows.
nr	If number of matrix rows is larger than this value, random nr rows are used.
internal	Internally used.
verbose	Whether print messages.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

# There is no example
NULL
```

---

FCC

*Flatness of the CDF curve*

---

**Description**

Flatness of the CDF curve

**Usage**

```
FCC(consensus_mat, diff = 0.1)
```

**Arguments**

consensus_mat	A consensus matrix.
diff	Difference of $F(b) - F(a)$ .

**Details**

For  $a$  in  $[0, 0.5]$  and for  $b$  in  $[0.5, 1]$ , the flatness measures the flatness of the CDF curve of the consensus matrix. It is calculated as the maximum width that fits  $F(b) - F(a) \leq \text{diff}$

**Value**

A numeric value.

**Examples**

```

data(cola_rl)
FCC(get_consensus(cola_rl[1, 1], k = 2))
FCC(get_consensus(cola_rl[1, 1], k = 3))
FCC(get_consensus(cola_rl[1, 1], k = 4))
FCC(get_consensus(cola_rl[1, 1], k = 5))
FCC(get_consensus(cola_rl[1, 1], k = 6))

```

---

find\_best\_km

*Find a best k for the k-means clustering*

---

**Description**

Find a best k for the k-means clustering

**Usage**

```
find_best_km(mat, max_km = 15)
```

**Arguments**

mat	A matrix where k-means clustering is executed by rows.
max_km	Maximal k to try.

**Details**

The best k is determined by looking for the knee/elbow of the WSS curve (within-cluster sum of square).

Note this function is only for a rough and quick determination of the best k.

**Examples**

```

# There is no example
NULL

```

---

functional\_enrichment-ANY-method

*Perform functional enrichment on signature genes*

---

**Description**

Perform functional enrichment on signature genes

**Usage**

```

## S4 method for signature 'ANY'
functional_enrichment(object,
  id_mapping = guess_id_mapping(object, org_db, verbose),
  org_db = "org.Hs.eg.db", ontology = "BP",
  min_set_size = 10, max_set_size = 1000,
  verbose = TRUE, prefix = "", ...)

```

**Arguments**

object	A vector of gene IDs.
id_mapping	If the gene IDs which are row names of the original matrix are not Entrez IDs, a named vector should be provided where the names are the gene IDs in the matrix and values are corresponding Entrez IDs. The value can also be a function that converts gene IDs.
org_db	Annotation database.
ontology	Following ontologies are allowed: BP, CC, MF, KEGG, Reactome. MSigDb with the gmt file set by gmt_file argument, or gmt for general gmt gene sets.
min_set_size	The minimal size of the gene sets.
max_set_size	The maximal size of the gene sets.
verbose	Whether to print messages.
prefix	Used internally.
...	Pass to <a href="#">enrichGO</a> , <a href="#">enrichKEGG</a> , <a href="#">enricher</a> , <a href="#">enrichDO</a> or <a href="#">enrichPathway</a> .

**Details**

The function enrichment is applied by clusterProfiler, DOSE or ReactomePA packages.

**Value**

A data frame.

**Examples**

```
# There is no example
NULL
```

---

functional\_enrichment-ConsensusPartition-method

*Perform functional enrichment on signature genes*

---

**Description**

Perform functional enrichment on signature genes

**Usage**

```
## S4 method for signature 'ConsensusPartition'
functional_enrichment(object, gene_fdr_cutoff = cola_opt$fdr_cutoff, k = suggest_best_k(object),
  row_km = NULL, id_mapping = guess_id_mapping(rownames(object), org_db, verbose),
  org_db = "org.Hs.eg.db", ontology = "BP",
  min_set_size = 10, max_set_size = 1000,
  verbose = TRUE, ...)
```

**Arguments**

object	a <a href="#">ConsensusPartition-class</a> object from <a href="#">run_all_consensus_partition_methods</a> .
gene_fdr_cutoff	Cutoff of FDR to define significant signature genes.
k	Number of subgroups.
row_km	Number of row clusterings by k-means to separate the matrix that only contains signatures.
id_mapping	If the gene IDs which are row names of the original matrix are not Entrez IDs, a named vector should be provided where the names are the gene IDs in the matrix and values are corresponding Entrez IDs. The value can also be a function that converts gene IDs.
org_db	Annotation database.
ontology	See corresponding argument in <a href="#">functional_enrichment, ANY-method</a> .
min_set_size	The minimal size of the gene sets.
max_set_size	The maximal size of the gene sets.
verbose	Whether to print messages.
...	Pass to <a href="#">functional_enrichment, ANY-method</a> .

**Details**

For how to control the parameters of functional enrichment, see help page of [functional\\_enrichment, ANY-method](#).

**Value**

A list of data frames which correspond to results for the functional ontologies:

**Examples**

```
# There is no example
NULL
```

---

functional\_enrichment-ConsensusPartitionList-method

*Perform functional enrichment on signature genes*

---

**Description**

Perform functional enrichment on signature genes

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'
functional_enrichment(object, gene_fdr_cutoff = cola_opt$fdr_cutoff,
  id_mapping = guess_id_mapping(rownames(object), org_db, FALSE),
  org_db = "org.Hs.eg.db", ontology = "BP",
  min_set_size = 10, max_set_size = 1000, ...)
```

**Arguments**

object	A <a href="#">ConsensusPartitionList-class</a> object from <a href="#">run_all_consensus_partition_methods</a> .
gene_fdr_cutoff	Cutoff of FDR to define significant signature genes.
id_mapping	If the gene IDs which are row names of the original matrix are not Entrez IDs, a named vector should be provided where the names are the gene IDs in the matrix and values are corresponding Entrez IDs. The value can also be a function that converts gene IDs.
org_db	Annotation database.
ontology	See corresponding argument in <a href="#">functional_enrichment, ANY-method</a> .
min_set_size	The minimal size of the gene sets.
max_set_size	The maximal size of the gene sets.
...	Pass to <a href="#">functional_enrichment, ANY-method</a> .

**Details**

For each method, the signature genes are extracted based on the best k.

It calls [functional\\_enrichment, ConsensusPartition-method](#) on the consensus partitioning results for each method.

For how to control the parameters of functional enrichment, see help page of [functional\\_enrichment, ANY-method](#).

**Value**

A list where each element in the list corresponds to enrichment results from a single method.

**Examples**

```
# There is no example
NULL
```

---

functional\_enrichment-dispatch

*Method dispatch page for functional\_enrichment*

---

**Description**

Method dispatch page for functional\_enrichment.

**Dispatch**

functional\_enrichment can be dispatched on following classes:

- [functional\\_enrichment, ANY-method, ANY-class](#) class method
- [functional\\_enrichment, ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [functional\\_enrichment, ConsensusPartition-method, ConsensusPartition-class](#) class method

**Examples**

```
# no example
NULL
```

---

get\_anno-ConsensusPartition-method  
*Get annotations*

---

**Description**

Get annotations

**Usage**

```
## S4 method for signature 'ConsensusPartition'
get_anno(object)
```

**Arguments**

object            A [ConsensusPartition-class](#) object

**Value**

A data frame if anno was specified in [run\\_all\\_consensus\\_partition\\_methods](#) or [consensus\\_partition](#), or else NULL.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
# There is no example
NULL
```

---

get\_anno-ConsensusPartitionList-method  
*Get annotations*

---

**Description**

Get annotations

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'
get_anno(object)
```

**Arguments**

object            A [ConsensusPartitionList-class](#) object

**Value**

A data frame if anno was specified in [run\\_all\\_consensus\\_partition\\_methods](#), or else NULL.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
# There is no example
NULL
```

---

get\_anno-dispatch            *Method dispatch page for get\_anno*

---

**Description**

Method dispatch page for get\_anno.

**Dispatch**

get\_anno can be dispatched on following classes:

- [get\\_anno, ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [get\\_anno, ConsensusPartition-method, ConsensusPartition-class](#) class method

**Examples**

```
# no example
NULL
```

---

get\_anno\_col-ConsensusPartition-method  
*Get annotation colors*

---

### Description

Get annotation colors

### Usage

```
## S4 method for signature 'ConsensusPartition'  
get_anno_col(object)
```

### Arguments

object            A [ConsensusPartition-class](#) object

### Value

A list of color vectors or else NULL.

### Author(s)

Zuguang Gu <z.gu@dkfz.de>

### Examples

```
# There is no example  
NULL
```

---

get\_anno\_col-ConsensusPartitionList-method  
*Get annotation colors*

---

### Description

Get annotation colors

### Usage

```
## S4 method for signature 'ConsensusPartitionList'  
get_anno_col(object)
```

### Arguments

object            A [ConsensusPartitionList-class](#) object

### Value

A list of color vectors or else NULL.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
# There is no example
NULL
```

---

get\_anno\_col-dispatch *Method dispatch page for get\_anno\_col*

---

**Description**

Method dispatch page for get\_anno\_col.

**Dispatch**

get\_anno\_col can be dispatched on following classes:

- [get\\_anno\\_col, ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [get\\_anno\\_col, ConsensusPartition-method, ConsensusPartition-class](#) class method

**Examples**

```
# no example
NULL
```

---

get\_classes-ConsensusPartition-method  
*Get class IDs from the ConsensusPartition object*

---

**Description**

Get class IDs from the ConsensusPartition object

**Usage**

```
## S4 method for signature 'ConsensusPartition'
get_classes(object, k = object@k)
```

**Arguments**

object            A [ConsensusPartition-class](#) object.  
k                 Number of partitions.

**Value**

A data frame with class IDs and other columns which are entropy of the percent membership matrix and the silhouette scores which measure the stability of a sample to stay in its group.

If *k* is not specified, it returns a data frame with class IDs from every *k*.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(cola_r1)
obj = cola_r1["sd", "kmeans"]
get_classes(obj, k = 2)
get_classes(obj)
```

---

get\_classes-ConsensusPartitionList-method

*Get class IDs from the ConsensusPartitionList object*

---

**Description**

Get class IDs from the ConsensusPartitionList object

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'
get_classes(object, k)
```

**Arguments**

object	A <a href="#">ConsensusPartitionList-class</a> object.
k	Number of partitions.

**Details**

The class IDs are inferred by merging partitions from all methods by weighting the mean silhouette scores in each method.

**Value**

A data frame with class IDs and other columns which are entropy of the percent membership matrix and the silhouette scores which measure the stability of a sample to stay in its group.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(cola_r1)
get_classes(cola_r1, k = 2)
```

---

get\_classes-dispatch *Method dispatch page for get\_classes*

---

### Description

Method dispatch page for get\_classes.

### Dispatch

get\_classes can be dispatched on following classes:

- [get\\_classes,ConsensusPartitionList-method](#), [ConsensusPartitionList-class](#) class method
- [get\\_classes,ConsensusPartition-method](#), [ConsensusPartition-class](#) class method

### Examples

```
# no example  
NULL
```

---

get\_consensus-ConsensusPartition-method  
*Get consensus matrix*

---

### Description

Get consensus matrix

### Usage

```
## S4 method for signature 'ConsensusPartition'  
get_consensus(object, k)
```

### Arguments

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of partitions.

### Details

For row  $i$  and column  $j$  in the consensus matrix, the value of corresponding  $x_{ij}$  is the probability of sample  $i$  and sample  $j$  being in the same group from all partitions.

### Value

A consensus matrix corresponding to the current  $k$ .

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(cola_r1)
obj = cola_r1["sd", "kmeans"]
get_consensus(obj, k = 2)
```

---

*get\_matrix-ConsensusPartition-method*  
*Get the original matrix*

---

**Description**

Get the original matrix

**Usage**

```
## S4 method for signature 'ConsensusPartition'
get_matrix(object)
```

**Arguments**

object            A [ConsensusPartition-class](#) object

**Value**

A numeric matrix.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(cola_r1)
obj = cola_r1["sd", "kmeans"]
get_matrix(obj)
```

get\_matrix-ConsensusPartitionList-method  
*Get the original matrix*

---

**Description**

Get the original matrix

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'  
get_matrix(object)
```

**Arguments**

object            A [ConsensusPartitionList-class](#) object

**Value**

A numeric matrix.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(coala_r1)  
get_matrix(coala_r1)
```

---

get\_matrix-dispatch    *Method dispatch page for get\_matrix*

---

**Description**

Method dispatch page for get\_matrix.

**Dispatch**

get\_matrix can be dispatched on following classes:

- [get\\_matrix,ConsensusPartitionList-method,ConsensusPartitionList-class](#) class method
- [get\\_matrix,ConsensusPartition-method,ConsensusPartition-class](#) class method

**Examples**

```
# no example  
NULL
```

---

get\_membership-ConsensusPartition-method  
*Get membership matrix*

---

## Description

Get membership matrix

## Usage

```
## S4 method for signature 'ConsensusPartition'  
get_membership(object, k, each = FALSE)
```

## Arguments

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of partitions.
each	Whether return the percentage membership matrix which is summarized from all partitions or the individual membership in every random partition.

## Details

If each == FALSE, the value in the membership matrix is the probability to be in one class, while if each == TRUE, the membership matrix contains the class labels for every single partitions which are from randomly sampling subset of rows in the matrix.

The percent membership matrix is calculated by [cl\\_consensus](#).

## Value

If each == TRUE, it returns a membership matrix where rows correspond to the columns in the original matrix.

## Author(s)

Zuguang Gu <z.gu@dkfz.de>

## See Also

[get\\_membership](#), [ConsensusPartitionList-method](#) summarizes membership from partitions from all combinations of top-value methods and partition methods.

## Examples

```
data(cola_r1)  
obj = cola_r1["sd", "kmeans"]  
get_membership(obj, k = 2)  
get_membership(obj, k = 2, each = TRUE)
```

---

get\_membership-ConsensusPartitionList-method  
*Get membership matrix*

---

**Description**

Get membership matrix

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'  
get_membership(object, k)
```

**Arguments**

object	A <a href="#">ConsensusPartitionList-class</a> object.
k	Number of partitions.

**Details**

The membership matrix (the probability of each sample to be in one group, if assuming columns represent samples) is inferred from the consensus partition of every combination of methods, weighted by the mean silhouette score of the partition for each method. So methods which give instable partitions have lower weights when summarizing membership matrix from all methods.

**Value**

A membership matrix where rows correspond to the columns in the original matrix.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**See Also**

[get\\_membership, ConsensusPartition-method](#) returns membership matrix for a single top-value method and partition method.

**Examples**

```
data(coala_r1)  
get_membership(coala_r1, k = 2)
```

---

get\_membership-dispatch

*Method dispatch page for get\_membership*

---

### Description

Method dispatch page for get\_membership.

### Dispatch

get\_membership can be dispatched on following classes:

- [get\\_membership, ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [get\\_membership, ConsensusPartition-method, ConsensusPartition-class](#) class method

### Examples

```
# no example  
NULL
```

---

get\_param-ConsensusPartition-method

*Get parameters*

---

### Description

Get parameters

### Usage

```
## S4 method for signature 'ConsensusPartition'  
get_param(object, k = object@k, unique = TRUE)
```

### Arguments

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of partitions.
unique	Whether apply <a href="#">unique</a> to rows of the returned data frame.

### Details

It is mainly used internally.

### Value

A data frame of parameters corresponding to the current k. In the data frame, each row corresponds to a partition run.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(cola_r1)
obj = cola_r1["sd", "kmeans"]
get_param(obj)
get_param(obj, k = 2)
get_param(obj, unique = FALSE)
```

---

get\_signatures-ConsensusPartition-method  
*Get signature rows*

---

**Description**

Get signature rows

**Usage**

```
## S4 method for signature 'ConsensusPartition'
get_signatures(object, k,
  silhouette_cutoff = 0.5,
  fdr_cutoff = cola_opt$fdr_cutoff,
  group_diff = cola_opt$group_diff,
  scale_rows = object@scale_rows,
  row_km = NULL,
  diff_method = c("Ftest", "ttest", "samr", "pamr", "one_vs_others"),
  anno = get_anno(object),
  anno_col = get_anno_col(object),
  internal = FALSE,
  show_row_dend = FALSE,
  show_column_names = FALSE, use_raster = TRUE,
  plot = TRUE, verbose = TRUE, seed = 888,
  left_annotation = NULL, right_annotation = NULL,
  col = if(scale_rows) c("green", "white", "red") else c("blue", "white", "red"),
  simplify = FALSE,
  ...)
```

**Arguments**

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of partitions.
silhouette_cutoff	Cutoff for silhouette scores. Samples with values less than it are not used for finding signature rows. For selecting a proper silhouette cutoff, please refer to <a href="https://www.stat.berkeley.edu/~s133/Cluster2a.html#tth_tAb1">https://www.stat.berkeley.edu/~s133/Cluster2a.html#tth_tAb1</a> .
fdr_cutoff	Cutoff for FDR of the difference test between subgroups.
group_diff	Cutoff for the maximal difference between group means.

scale_rows	Whether apply row scaling when making the heatmap.
row_km	Number of groups for performing k-means clustering on rows. By default it is automatically selected.
diff_method	Methods to get rows which are significantly different between subgroups, see 'Details' section.
anno	A data frame of annotations for the original matrix columns. By default it uses the annotations specified in <a href="#">consensus_partition</a> or <a href="#">run_all_consensus_partition_methods</a> .
anno_col	A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.
internal	Used internally.
show_row_dend	Whether show row dendrogram.
show_column_names	Whether show column names in the heatmap.
use_raster	Internally used.
plot	Whether to make the plot.
verbose	Whether to print messages.
seed	Random seed.
left_annotation	Annotation put on the left of the heatmap. It should be a <a href="#">HeatmapAnnotation-class</a> object. The number of items should be the same as the number of the original matrix rows. The subsetting to the significant rows are automatically performed on the annotation object.
right_annotation	Annotation put on the right of the heatmap. Same format as left_annotation.
col	Colors.
simplify	Only use internally.
...	Other arguments.

## Details

Basically the function applies statistical test for the difference in subgroups for every row. There are following methods which test significance of the difference:

**tttest** First it looks for the subgroup with highest mean value, compare to each of the other subgroups with t-test and take the maximum p-value. Second it looks for the subgroup with lowest mean value, compare to each of the other subgroups again with t-test and take the maximum p-values. Later for these two list of p-values take the minimal p-value as the final p-value.

**samr/pamr** use SAM (from samr package)/PAM (from pamr package) method to find significantly different rows between subgroups.

**Ftest** use F-test to find significantly different rows between subgroups.

**one\_vs\_others** For each subgroup  $i$  in each row, it uses t-test to compare samples in current subgroup to all other samples, denoted as  $p_i$ . The p-value for current row is selected as  $\min(p_i)$ .

`diff_method` can also be a self-defined function. The function needs two arguments which are the matrix for the analysis and the predicted classes. The function should returns a vector of FDR from the difference test.

**Value**

A data frame with more than two columns:

**which\_row:** row index corresponding to the original matrix.

**fdr:** the FDR.

**km:** the k-means groups if row\_km is set.

**other\_columns:** the mean value (depending rows are scaled or not) in each subgroup.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
# There is no example
NULL
```

---

```
get_stats-ConsensusPartition-method
```

*Get statistics for the consensus partition*

---

**Description**

Get statistics for the consensus partition

**Usage**

```
## S4 method for signature 'ConsensusPartition'
get_stats(object, k = object@k, all_stats = FALSE)
```

**Arguments**

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of partitions. The value can be a vector.
all_stats	Whether to show all statistics that were calculated. Used internally.

**Details**

The statistics are:

**PAC** proportion of ambiguous clustering, calculated by [PAC](#).

**mean\_silhouette** the mean silhouette score. See [https://en.wikipedia.org/wiki/Silhouette\\_\(clustering\)](https://en.wikipedia.org/wiki/Silhouette_(clustering)).

**concordance** the mean probability that each partition fits the consensus partition, calculated by [concordance](#).

**area\_increased** the increased area under ECDF (the empirical cumulative distribution function curve) to the previous k.

**Rand** the Rand index which is the percent of pairs of samples that are both in a same cluster or both are not in a same cluster in the partition of  $k$  and  $k-1$ . See [https://en.wikipedia.org/wiki/Rand\\_index](https://en.wikipedia.org/wiki/Rand_index).

**Jaccard** the ratio of pairs of samples are both in a same cluster in the partition of  $k$  and  $k-1$  and the pairs of samples are both in a same cluster in the partition  $k$  or  $k-1$ .

### Value

A matrix of partition statistics.

### Author(s)

Zuguang Gu <z.gu@dkfz.de>

### Examples

```
data(coala_r1)
obj = coala_r1["sd", "kmeans"]
get_stats(obj)
get_stats(obj, k = 2)
```

---

get\_stats-ConsensusPartitionList-method

*Get statistics for consensus partitions from all methods*

---

### Description

Get statistics for consensus partitions from all methods

### Usage

```
## S4 method for signature 'ConsensusPartitionList'
get_stats(object, k, all_stats = FALSE)
```

### Arguments

object	A <a href="#">ConsensusPartitionList-class</a> object.
k	Number of partitions. The value can only be a single value.
all_stats	Whether to show all statistics that were calculated. Used internally.

### Value

A matrix of partition statistics for a selected  $k$ . Rows in the matrix correspond to combinations of top-value methods and partition methods.

### Author(s)

Zuguang Gu <z.gu@dkfz.de>

### Examples

```
data(coala_r1)
get_stats(coala_r1, k = 2)
```

---

get\_stats-dispatch     *Method dispatch page for get\_stats*

---

### Description

Method dispatch page for get\_stats.

### Dispatch

get\_stats can be dispatched on following classes:

- [get\\_stats, ConsensusPartitionList-method](#), [ConsensusPartitionList-class](#) class method
- [get\\_stats, ConsensusPartition-method](#), [ConsensusPartition-class](#) class method

### Examples

```
# no example
NULL
```

---

is\_best\_k-ConsensusPartition-method  
*Test whether the current k is the best/optional k*

---

### Description

Test whether the current k is the best/optional k

### Usage

```
## S4 method for signature 'ConsensusPartition'
is_best_k(object, k, ...)
```

### Arguments

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of subgroups.
...	Pass to <a href="#">suggest_best_k, ConsensusPartition-method</a>

### Value

Logical scalar.

### Examples

```
# There is no example
NULL
```

---

```
is_best_k-ConsensusPartitionList-method
    Test whether the current k is the best/optional k
```

---

**Description**

Test whether the current k is the best/optional k

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'
is_best_k(object, k, ...)
```

**Arguments**

object	A <a href="#">ConsensusPartitionList-class</a> object.
k	Number of subgroups.
...	Pass to <a href="#">suggest_best_k,ConsensusPartitionList-method</a>

**Value**

Logical vector

**Examples**

```
# There is no example
NULL
```

---

```
is_best_k-dispatch    Method dispatch page for is_best_k
```

---

**Description**

Method dispatch page for is\_best\_k.

**Dispatch**

is\_best\_k can be dispatched on following classes:

- [is\\_best\\_k,ConsensusPartitionList-method,ConsensusPartitionList-class](#) class method
- [is\\_best\\_k,ConsensusPartition-method,ConsensusPartition-class](#) class method

**Examples**

```
# no example
NULL
```

---

*is\_stable\_k-ConsensusPartition-method*

*Test whether the current k corresponds to a stable partition*

---

### Description

Test whether the current k corresponds to a stable partition

### Usage

```
## S4 method for signature 'ConsensusPartition'
is_stable_k(object, k, ...)
```

### Arguments

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of subgroups.
...	Pass to <a href="#">suggest_best_k,ConsensusPartition-method</a>

### Value

Logical scalar

### Examples

```
# There is no example
NULL
```

---

*is\_stable\_k-ConsensusPartitionList-method*

*Test whether the current k corresponds to a stable partition*

---

### Description

Test whether the current k corresponds to a stable partition

### Usage

```
## S4 method for signature 'ConsensusPartitionList'
is_stable_k(object, k, ...)
```

### Arguments

object	A <a href="#">ConsensusPartitionList-class</a> object.
k	Number of subgroups.
...	Pass to <a href="#">suggest_best_k,ConsensusPartitionList-method</a>

**Value**

Logical vector

**Examples**

```
# There is no example
NULL
```

---

is\_stable\_k-dispatch *Method dispatch page for is\_stable\_k*

---

**Description**

Method dispatch page for is\_stable\_k.

**Dispatch**

is\_stable\_k can be dispatched on following classes:

- [is\\_stable\\_k,ConsensusPartitionList-method](#), [ConsensusPartitionList-class](#) class method
- [is\\_stable\\_k,ConsensusPartition-method](#), [ConsensusPartition-class](#) class method

**Examples**

```
# no example
NULL
```

---

knitr\_add\_tab\_item *Add one JavaScript tab in the report*

---

**Description**

Add one JavaScript tab in the report

**Usage**

```
knitr_add_tab_item(code, header, prefix, desc = "", opt = NULL,
  message = NULL, hide_and_show = FALSE)
```

**Arguments**

code	R code to execute.
header	Header or the title for the tab.
prefix	Prefix of the chunk label.
desc	Decription in the tab.
opt	Options for the knitr chunk.
message	Message to print.
hide_and_show	Whether to hide the code output.

**Details**

Each tab contains the R source code and results generated from it (figure, tables, text, ...).

This function is only for internal use.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**See Also**

[knitr\\_insert\\_tabs](#) produces a complete HTML fragment.

**Examples**

```
# There is no example
NULL
```

---

knitr_insert_tabs	<i>Generate the HTML fragment for the JavaScript tabs.</i>
-------------------	--

---

**Description**

Generate the HTML fragment for the JavaScript tabs.

**Usage**

```
knitr_insert_tabs(uid)
```

**Arguments**

uid                    A unique identifier for the div.

**Details**

The jQuery UI is used to generate html tabs (<https://jqueryui.com/tabs/>).

knitr\_insert\_tabs should be used after several callings of [knitr\\_add\\_tab\\_item](#) to generate a complete HTML fragment for all tabs with all necessary Javascript and css code.

This function is only for internal use.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
# There is no example
NULL
```

---

```
map_to_entrez_id      Map to Entrez IDs
```

---

**Description**

Map to Entrez IDs

**Usage**

```
map_to_entrez_id(from, org_db = "org.Hs.eg.db")
```

**Arguments**

from                    The input gene ID type. Valid values should be in, e.g. `columns(org.Hs.eg.db::org.Hs.eg.db)`.  
org\_db                   The annotation database.

**Details**

If there are multiple mappings from the input ID type to an unique Entrez ID, randomly picked one.

**Value**

A named vectors where names are IDs with input ID type and values are the Entrez IDs.  
The returned object normally is used in [functional\\_enrichment](#).

**Examples**

```
## Not run:
  map_to_entrez_id("ENSEMBL")

## End(Not run)
```

---

```
membership_heatmap-ConsensusPartition-method
      Heatmap of membership in each partition
```

---

**Description**

Heatmap of membership in each partition

**Usage**

```
## S4 method for signature 'ConsensusPartition'
membership_heatmap(object, k, internal = FALSE,
  anno = get_anno(object), anno_col = get_anno_col(object),
  show_column_names = FALSE, ...)
```

**Arguments**

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of partitions.
internal	Used internally.
anno	A data frame of annotations for the original matrix columns. By default it uses the annotations specified in <a href="#">consensus_partition</a> or <a href="#">run_all_consensus_partition_methods</a> .
anno_col	A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.
show_column_names	Whether show column names in the heatmap (which is the column name in the original matrix).
...	Other arguments

**Details**

Each row in the heatmap is the membership in one single partition.

Heatmap is split on rows by top\_n.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(cole_r1)
membership_heatmap(cole_r1["sd", "hclust"], k = 3)
```

---

ncol-ConsensusPartition-method

*Number of columns in the matrix*

---

**Description**

Number of columns in the matrix

**Usage**

```
## S4 method for signature 'ConsensusPartition'
ncol(x)
```

**Arguments**

x	A <a href="#">ConsensusPartition-class</a> object.
---	--

**Examples**

```
# There is no example  
NULL
```

---

ncol-ConsensusPartitionList-method

*Number of columns in the matrix*

---

**Description**

Number of columns in the matrix

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'  
ncol(x)
```

**Arguments**

x                    A [ConsensusPartitionList-class](#) object.

**Examples**

```
# There is no example  
NULL
```

---

ncol-dispatch

*Method dispatch page for ncol*

---

**Description**

Method dispatch page for ncol.

**Dispatch**

ncol can be dispatched on following classes:

- [ncol,ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [ncol,ConsensusPartition-method, ConsensusPartition-class](#) class method

**Examples**

```
# no example  
NULL
```

nrow-ConsensusPartition-method

*Number of rows in the matrix*

---

### Description

Number of rows in the matrix

### Usage

```
## S4 method for signature 'ConsensusPartition'  
nrow(x)
```

### Arguments

x                    A [ConsensusPartition-class](#) object.

### Examples

```
# There is no example  
NULL
```

---

nrow-ConsensusPartitionList-method

*Number of rows in the matrix*

---

### Description

Number of rows in the matrix

### Usage

```
## S4 method for signature 'ConsensusPartitionList'  
nrow(x)
```

### Arguments

x                    A [ConsensusPartitionList-class](#) object.

### Examples

```
# There is no example  
NULL
```

---

nrow-dispatch	<i>Method dispatch page for nrow</i>
---------------	--------------------------------------

---

**Description**

Method dispatch page for nrow.

**Dispatch**

nrow can be dispatched on following classes:

- [nrow, ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [nrow, ConsensusPartition-method, ConsensusPartition-class](#) class method

**Examples**

```
# no example
NULL
```

---

PAC	<i>The proportion of ambiguous clustering (PAC score)</i>
-----	---

---

**Description**

The proportion of ambiguous clustering (PAC score)

**Usage**

```
PAC(consensus_mat, x1 = 0.1, x2 = 0.9, class = NULL)
```

**Arguments**

consensus_mat	A consensus matrix.
x1	Lower bound to define "ambiguous clustering".
x2	Upper bound to define "ambihuous clustering".
class	class IDs. If it is provided, samples with silhouette score less than 5th percential are removed.

**Details**

The PAC score is defined as  $F(x_2) - F(x_1)$  where  $F(x)$  is the CDF of the consensus matrix.

**Value**

A single numeric vaule.

**See**

See <https://www.nature.com/articles/srep06207> for explanation of PAC score.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(cola_rl)
PAC(get_consensus(cola_rl[1, 1], k = 2))
PAC(get_consensus(cola_rl[1, 1], k = 3))
PAC(get_consensus(cola_rl[1, 1], k = 4))
PAC(get_consensus(cola_rl[1, 1], k = 5))
PAC(get_consensus(cola_rl[1, 1], k = 6))
```

---

plot\_ecdf-ConsensusPartition-method

*Plot the empirical cumulative distribution curve (ECDF) of the consensus matrix*

---

**Description**

Plot the empirical cumulative distribution curve (ECDF) of the consensus matrix

**Usage**

```
## S4 method for signature 'ConsensusPartition'
plot_ecdf(object, ...)
```

**Arguments**

object	A <code>ConsensusPartition-class</code> object.
...	Other arguments.

**Details**

It plots ECDF curve for each k.

This function is mainly used in `collect_plots` and `select_partition_number` functions.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**See Also**

See `ecdf` for a detailed explanation of the empirical cumulative distribution function.

**Examples**

```
data(cola_rl)
plot_ecdf(cola_rl["sd", "hclust"])
```

---

recalc_stats	<i>Recalculate statistics in the ConsensusPartitionList object</i>
--------------	--

---

**Description**

Recalculate statistics in the ConsensusPartitionList object

**Usage**

```
recalc_stats(rl)
```

**Arguments**

rl                   A [ConsensusPartitionList-class](#) object.

**Details**

It updates the statistics slot in the ConsensusPartitionList object, used internally.

**Examples**

```
# There is no example
NULL
```

---

register_NMF	<i>Register NMF partition method</i>
--------------	--------------------------------------

---

**Description**

Register NMF partition method

**Usage**

```
register_NMF()
```

**Details**

NMF analysis is performed by [nmf](#).

**Examples**

```
# There is no example
NULL
```

---

 register\_partition\_methods

*Register user-defined partition functions*

---

### Description

Register user-defined partition functions

### Usage

```
register_partition_methods(..., scale_method = c("z-score", "min-max", "none"))
```

### Arguments

`...` A named list of functions.

`scale_method` Normally, data matrix is scaled by rows before sent to the partition function. The default scaling is applied by `scale`. However, some partition functions may not accept negative values which are produced by `scale`. Here `scale_method` can be set to `min-max` which scales rows by  $(x - \min) / (\max - \min)$ . Note here `scale_method` only means the method to scale rows. When `scale_rows` is set to `FALSE` in `consensus_partition` or `run_all_consensus_partition_methods`, there will be no row scaling when doing partitioning. The value for `scale_method` can be a vector if user specifies more than one partition function.

### Details

The user-defined function should accept at least two arguments. The first two arguments are the data matrix and the number of partitions. The third optional argument should always be `...` so that parameters for the partition function can be passed by `partition_param` from `consensus_partition`. If users forget to add `...`, it is added internally.

The function should return a vector of partitions (or class labels) or an object which can be recognized by `cl_membership`.

The partition function should be applied on columns (Users should be careful with this because some R functions apply on rows and some R functions apply on columns). E.g. following is how we register `kmeans` partition method:

```
register_partition_methods(
  kmeans = function(mat, k, ...) {
    # mat is transposed because kmeans() applies on rows
    kmeans(t(mat), centers = k, ...)$centers
  }
)
```

The registered partition methods will be used as defaults in `run_all_consensus_partition_methods`.

To remove a partition method, use `remove_partition_methods`.

There are following default partition methods:

**"hclust"** hierarchcial clustering with Euclidean distance, later columns are partitioned by `cutree`. If users want to use another distance metric or clustering method, consider to register a new partition method. E.g. `register_partition_methods(hclust_cor = function(mat, k) cutree(hclust(as.dist(cor(mat)))))`.

"kmeans" by [kmeans](#).

"skmeans" by [skmeans](#).

"pam" by [pam](#).

"mclust" by [Mclust](#). mclust is applied to the first three principle components from rows.

Users can register two other pre-defined partition methods by [register\\_NMF](#) and [register\\_SOM](#).

### Value

No value is returned.

### Author(s)

Zuguang Gu <[z.gu@dkfz.de](mailto:z.gu@dkfz.de)>

### See Also

[all\\_partition\\_methods](#) lists all registered partition methods.

### Examples

```
all_partition_methods()
register_partition_methods(
  random = function(mat, k) sample(k, ncol(mat), replace = TRUE)
)
all_partition_methods()
remove_partition_methods("random")
```

---

register\_SOM

*Register SOM partition method*

---

### Description

Register SOM partition method

### Usage

```
register_SOM()
```

### Details

The SOM analysis is performed by [som](#).

### Examples

```
# There is no example
NULL
```

---

`register_top_value_methods`*Register user-defined top-value methods*

---

### Description

Register user-defined top-value methods

### Usage

```
register_top_value_methods(...)
```

### Arguments

...                    A named list of functions.

### Details

The user-defined function should accept one argument which is the data matrix where the scores are calculated by rows. Rows with top scores are treated as "top rows" in cola analysis. Following is how we register "sd" (standard deviation) top-value method:

```
register_top_value_methods(sd = function(mat) apply(mat, 1, sd))
```

Of course, you can use [rowSds](#) to give a faster calculation of row sd:

```
register_top_value_methods(sd = rowSds)
```

The registered top-value method will be used as defaults in [run\\_all\\_consensus\\_partition\\_methods](#).

To remove a top-value method, use [remove\\_top\\_value\\_methods](#).

There are four default top-value methods:

"sd" standard deviation, by [rowSds](#).

"cv" coefficient variance, calculated as  $sd/(mean+s)$  where s is the 10<sup>th</sup> percentile of all row means.

"MAD" median absolute deviation, by [rowMads](#).

"ATC" the [ATC](#) method.

### Value

No value is returned.

### Author(s)

Zuguang Gu <z.gu@dkfz.de>

### See Also

[all\\_top\\_value\\_methods](#) lists all registered top-value methods.

**Examples**

```

all_top_value_methods()
register_top_value_methods(
  ATC_spearman = function(mat) ATC(mat, method = "spearman")
)
all_top_value_methods()
remove_top_value_methods("ATC_spearman")

```

---

relabel_class	<i>Relabel class labels according to the reference labels</i>
---------------	---

---

**Description**

Relabel class labels according to the reference labels

**Usage**

```
relabel_class(class, ref, full_set = union(class, ref), return_map = TRUE)
```

**Arguments**

class	A vector of class labels.
ref	A vector of reference labels.
full_set	The full set of labels.
return_map	Whether return the mapping or the adjusted labels.

**Details**

In partitions, the exact value of the class label is not of importance. E.g. for two partitions  $a, a, a, b, b, b, b$  and  $b, b, b, a, a, a, a$ , they are the same partitions although the labels of  $a$  and  $b$  are switched in the two partitions. Here `relabel_class` function switches the labels in `class` vector according to the labels in `ref` vector to maximize `sum(class == ref)`.

Mathematically, this is called linear sum assignment problem and it is solved by [solve\\_LSAP](#).

**Value**

A named vector where names correspond to the labels in `class` and values correspond to `ref`, which means `map = relabel_class(class, ref)`; `map[class]` returns the relabelled labels.

The returned object attaches a data frame with three columns:

- original labels. in `class`
- adjusted labels. according to `ref`
- reference labels. in `ref`

If `return_map` in the `relabel_class` is set to `FALSE`, the function simply returns a vector of adjusted class labels.

If the function returns the mapping vector (when `return_map = TRUE`), the mapping variable is always character, which means, if your `class` and `ref` are numeric, you need to convert them back to numeric explicitly. If `return_map = FALSE`, the returned relabelled vector has the same mode as `class`.

**Examples**

```
class = c(rep("a", 10), rep("b", 3))
ref = c(rep("b", 4), rep("a", 9))
relabel_class(class, ref)
relabel_class(class, ref, return_map = FALSE)
# if class and ref are from completely different sets
class = c(rep("A", 10), rep("B", 3))
relabel_class(class, ref)

# class labels are numeric
class = c(rep(1, 10), rep(2, 3))
ref = c(rep(2, 4), rep(1, 9))
relabel_class(class, ref)
relabel_class(class, ref, return_map = FALSE)
```

---

remove\_partition\_methods

*Remove partition methods*

---

**Description**

Remove partition methods

**Usage**

```
remove_partition_methods(method)
```

**Arguments**

method            Name of the partition methods to be removed.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
# There is no example

# There is no example  
NULL
```

---

rownames-dispatch

*Method dispatch page for rownames*

---

### Description

Method dispatch page for rownames.

### Dispatch

rownames can be dispatched on following classes:

- [rownames, ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [rownames, ConsensusPartition-method, ConsensusPartition-class](#) class method

### Examples

```
# no example  
NULL
```

---

run\_all\_consensus\_partition\_methods

*Consensus partition for all combinations of methods*

---

## Description

Consensus partition for all combinations of methods

## Usage

```
run_all_consensus_partition_methods(data,
  top_value_method = all_top_value_methods(),
  partition_method = all_partition_methods(),
  max_k = 6,
  top_n = seq(min(1000, round(nrow(data)*0.1)),
    min(5000, round(nrow(data)*0.5)),
    length.out = 5),
  mc.cores = 1, anno = NULL, anno_col = NULL,
  sample_by = "row", p_sampling = 0.8, partition_repeat = 50,
  scale_rows = NULL, verbose = TRUE)
```

## Arguments

data	A numeric matrix where subgroups are found by columns.
top_value_method	Method which are used to extract top n rows. Allowed methods are in <a href="#">all_top_value_methods</a> and can be self-added by <a href="#">register_top_value_methods</a> .
partition_method	Method which are used to do partition on samples. Allowed methods are in <a href="#">all_partition_methods</a> and can be self-added by <a href="#">register_partition_methods</a> .
max_k	Maximal number of partitions to try. The function will try 2:max_k partitions.
top_n	Number of rows with top values. The value can be a vector with length > 1. When n > 5000, the function only randomly sample 5000 rows from top n rows. If top_n is a vector, partition will be applied to every values in top_n and consensus partition is summarized from all partitions.
mc.cores	Number of cores to use.
anno	A data frame with known annotation of columns.
anno_col	A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.
sample_by	Should randomly sample the matrix by rows or by columns?
p_sampling	Proportion of the top n rows to sample.
partition_repeat	Number of repeats for the random sampling.
scale_rows	Whether to scale rows. If it is TRUE, scaling method defined in <a href="#">register_partition_methods</a> is used.
verbose	Whether to print messages.

**Details**

The function runs consensus partitioning by `consensus_partition` for all combinations of top-value methods and partition methods.

It also adjusts the class IDs for all methods and for all k to make them as consistent as possible.

**Value**

A `ConsensusPartitionList-class` object. Simply type object in the interactive R session to see which functions can be applied on it.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
## Not run:
set.seed(123)
m = cbind(rbind(matrix(rnorm(20*20, mean = 1), nr = 20),
                    matrix(rnorm(20*20, mean = -1), nr = 20)),
          rbind(matrix(rnorm(20*20, mean = -1), nr = 20),
                    matrix(rnorm(20*20, mean = 1), nr = 20))
          ) + matrix(rnorm(40*40), nr = 40)
r1 = run_all_consensus_partition_methods(data = m, top_n = c(20, 30, 40))

## End(Not run)
data(cola_r1)
cola_r1
```

---

select\_partition\_number-ConsensusPartition-method

*Several plots for determining the optimized number of partitions*

---

**Description**

Several plots for determining the optimized number of partitions

**Usage**

```
## S4 method for signature 'ConsensusPartition'
select_partition_number(object, all_stats = FALSE)
```

**Arguments**

<code>object</code>	A <code>ConsensusPartition-class</code> object.
<code>all_stats</code>	Whether to show all statistics that were calculated. Used internally.

**Details**

There are following plots made:

- ECDF of the consensus matrix under each k, made by `plot_ecdf, ConsensusPartition-method`,
- PAC score,
- mean silhouette score,
- the `concordance` for each partition to the consensus partition,
- area increase of the area under the ECDF of consensus matrix with increasing k,
- Rand index for current k compared to k - 1,
- Jaccard coefficient for current k compared to k - 1,

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
data(coLa_r1)
select_partition_number(coLa_r1["sd", "hclust"])
```

---

show-ConsensusPartition-method

*Print the ConsensusPartition object*

---

**Description**

Print the ConsensusPartition object

**Usage**

```
## S4 method for signature 'ConsensusPartition'
show(object)
```

**Arguments**

object            A `ConsensusPartition-class` object.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
# There is no example
NULL
```

---

show-ConsensusPartitionList-method

*Print the ConsensusPartitionList object*

---

**Description**

Print the ConsensusPartitionList object

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'
show(object)
```

**Arguments**

object            A [ConsensusPartitionList-class](#) object.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
# There is no example
NULL
```

---

show-dispatch

*Method dispatch page for show*

---

**Description**

Method dispatch page for show.

**Dispatch**

show can be dispatched on following classes:

- [show,ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [show,ConsensusPartition-method, ConsensusPartition-class](#) class method

**Examples**

```
# no example
NULL
```

---

submit_to_david	<i>Perform DAVID analysis</i>
-----------------	-------------------------------

---

**Description**

Perform DAVID analysis

**Usage**

```
submit_to_david(genes, email,
  catalog = c("GOTERM_CC_FAT", "GOTERM_BP_FAT", "GOTERM_MF_FAT", "KEGG_PATHWAY"),
  idtype = "ENSEMBL_GENE_ID", species = "Homo sapiens")
```

**Arguments**

genes	A vector of gene identifiers.
email	The email that user registered on DAVID web service ( <a href="https://david.ncifcrf.gov/content.jsp?file=WS.html">https://david.ncifcrf.gov/content.jsp?file=WS.html</a> ).
catalog	A vector of function catalogs. Valid values should be in <code>cola::DAVID_ALL_CATALOGS</code> .
idtype	ID types for the input gene list. Valid values should be in <code>cola::DAVID_ALL_ID_TYPES</code> .
species	Full species name if the ID type is not uniquely mapped to one single species.

**Details**

This function directly sends the HTTP request to DAVID web service (<https://david.ncifcrf.gov/content.jsp?file=WS.html>) and parses the returned XML. The reason of writing this function is I have problems with other R packages doing DAVID analysis (e.g. `RDAVIDWebService`, <https://bioconductor.org/packages/devel/bioc/html/RDAVIDWebService.html>) because the rJava package `RDAVIDWebService` depends on can not be installed on my machine.

Users are encouraged to use more advanced gene set enrichment tools such as `clusterProfiler` (<http://www.bioconductor.org/packages/release/bioc/html/clusterProfiler.html>), or `fgsea` (<http://www.bioconductor.org/packages/release/bioc/html/fgsea.html>).

If you want to run this function multiple times, please set time intervals between runs.

**Value**

A data frame with functional enrichment results.

**Author(s)**

Zuguang Gu <[z.gu@dkfz.de](mailto:z.gu@dkfz.de)>

**See Also**

<https://david.ncifcrf.gov>

## Examples

```
# There is no example
NULL
```

---

```
suggest_best_k-ConsensusPartition-method
Suggest the best number of partitions
```

---

## Description

Suggest the best number of partitions

## Usage

```
## S4 method for signature 'ConsensusPartition'
suggest_best_k(object, jaccard_index_cutoff = 0.95)
```

## Arguments

object            A [ConsensusPartition-class](#) object.  
jaccard\_index\_cutoff            The cutoff for Jaccard index compared to previous k.

## Details

The best k is selected according to following rules:

- All k with Jaccard index larger than 0.95 are removed because increasing k does not provide enough extra information. If all k are removed, it is marked as no subgroup is detected.
- For all k with 1-PAC score larger than 0.9, the maximal k is taken as the best k, and other k are marked as optional k.
- If it does not fit the second rule. The k with the maximal vote of the highest 1-PAC score, highest mean silhouette, and highest concordance is taken as the best k.

Additionally, if 1-PAC for the best k is larger than 0.9 (10 the partition), cola marks it as a stable partition. It should be noted that it is difficult to find the best k deterministically, we encourage users to compare results for all k and determine a proper one which best explain their studies.

## Value

The best k.

## Author(s)

Zuguang Gu <z.gu@dkfz.de>

## Examples

```
data(cola_r1)
obj = cola_r1["sd", "kmeans"]
suggest_best_k(obj)
```

---

suggest\_best\_k-ConsensusPartitionList-method

*Suggest the best number of partitions*

---

## Description

Suggest the best number of partitions

## Usage

```
## S4 method for signature 'ConsensusPartitionList'  
suggest_best_k(object, jaccard_index_cutoff = 0.95)
```

## Arguments

object            A [ConsensusPartitionList-class](#) object.  
jaccard\_index\_cutoff    The cutoff for Jaccard index compared to previous k.

## Details

It basically gives the best k for each combination of top-value method and partition method by calling [suggest\\_best\\_k, ConsensusPartition-method](#).

1-PAC score higher than 0.95 is treated as very stable partition and higher than 0.9 is treated as stable partition.

## Value

A data frame with the best k and other statistics for each combination of methods.

## Author(s)

Zuguang Gu <z.gu@dkfz.de>

## Examples

```
data(coala_r1)  
suggest_best_k(coala_r1)
```

---

suggest\_best\_k-dispatch

*Method dispatch page for suggest\_best\_k*

---

## Description

Method dispatch page for suggest\_best\_k.

**Dispatch**

suggest\_best\_k can be dispatched on following classes:

- [suggest\\_best\\_k, ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [suggest\\_best\\_k, ConsensusPartition-method, ConsensusPartition-class](#) class method

**Examples**

```
# no example
NULL
```

---

test\_between\_factors    *Test whether a list of factors are correlated*

---

**Description**

Test whether a list of factors are correlated

**Usage**

```
test_between_factors(x, y = NULL, all_factors = FALSE, verbose = FALSE)
```

**Arguments**

x	A data frame or a vector which contains discrete or continuous variables. if y is omit, pairwise testing for all columns in x is performed.
y	A data frame or a vector which contains discrete or continuous variables.
all_factors	Are all columns in x and y enforced to be factors?
verbose	Whether to print messages.

**Details**

Pairwise test is applied to every two columns in the data frames. Methods are:

- two numeric variables: correlation test by [cor.test](#) is applied;
- two character or factor variables: [chisq.test](#) is applied;
- one numeric variable and one character/factor variable: oneway ANOVA test by [oneway.test](#) is applied.

This function can be used to test the correlation between the predicted classes and other known factors.

**Value**

A matrix of p-values. If there are NA values, basically it means there are no efficient data points to perform the test.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
df = data.frame(
  v1 = rnorm(100),
  v2 = sample(letters[1:3], 100, replace = TRUE),
  v3 = sample(LETTERS[5:6], 100, replace = TRUE)
)
test_between_factors(df)
x = runif(100)
test_between_factors(x, df)
```

---

test\_to\_known\_factors-ConsensusPartition-method

*Test correspondance between predicted classes and known factors*

---

**Description**

Test correspondance between predicted classes and known factors

**Usage**

```
## S4 method for signature 'ConsensusPartition'
test_to_known_factors(object, k, known = get_anno(object),
  silhouette_cutoff = 0.5, verbose = FALSE)
```

**Arguments**

object	A <a href="#">ConsensusPartition-class</a> object.
k	Number of partitions. It uses all k if it is not set.
known	A vector or a data frame with known factors. By default it is the annotation table set in <a href="#">consensus_partition</a> or <a href="#">run_all_consensus_partition_methods</a> .
silhouette_cutoff	Cutoff for silhouette scores. Samples with value less than it are omit.
verbose	Whether to print messages.

**Value**

A data frame with columns:

- number of samples used to test after filtered by silhouette\_cutoff
- p-values from the tests
- number of partitions

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**See Also**

---

test\_to\_known\_factors-ConsensusPartitionList-method

*Test correspondance between predicted classes and known factors*

---

**Description**

Test correspondance between predicted classes and known factors

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'
test_to_known_factors(object, k, known = get_anno(object),
  silhouette_cutoff = 0.5, verbose = FALSE)
```

**Arguments**

object	A <a href="#">ConsensusPartitionList-class</a> object.
k	Number of partitions. It uses all k if it is not set.
known	A vector or a data frame with known factors. By default it is the annotation table set in <a href="#">consensus_partition</a> or <a href="#">run_all_consensus_partition_methods</a> .
silhouette_cutoff	Cutoff for silhouette scores. Samples with value less than this are omit.
verbose	Whether to print messages.

**Details**

The function basically sends each [ConsensusPartition-class](#) object to [test\\_to\\_known\\_factors, ConsensusPartit](#) and merges results afterwards.

**Value**

A data frame with columns:

- number of samples used to test after filtered by `silhouette_cutoff`
- p-values from the tests
- number of partitions

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**See Also**

[test\\_between\\_factors](#), [test\\_to\\_known\\_factors](#), [ConsensusPartition-method](#)

**Examples**

```
data(coala_r1)
test_to_known_factors(coala_r1, known = 1:40)
```

---

test\_to\_known\_factors-dispatch

*Method dispatch page for test\_to\_known\_factors*

---

**Description**

Method dispatch page for test\_to\_known\_factors.

**Dispatch**

test\_to\_known\_factors can be dispatched on following classes:

- [test\\_to\\_known\\_factors, ConsensusPartitionList-method, ConsensusPartitionList-class](#) class method
- [test\\_to\\_known\\_factors, ConsensusPartition-method, ConsensusPartition-class](#) class method

**Examples**

```
# no example
NULL
```

---

top\_elements\_overlap *Overlap of top elements from different metrics*

---

**Description**

Overlap of top elements from different metrics

**Usage**

```
top_elements_overlap(object, top_n = round(0.25*length(object[[1]])),
  method = c("euler", "venn", "correspondance"), ...)
```

**Arguments**

object	A list which contains values from different metrics.
top_n	Number of top rows.
method	euler: plot Euler diagram by <a href="#">euler</a> ; venn: plot Venn diagram by <a href="#">venn</a> ; correspondance: use <a href="#">correspond_between_rankings</a> .
...	Additional arguments passed to <a href="#">plot.euler</a> or <a href="#">correspond_between_rankings</a> .

**Details**

The  $i^{\text{th}}$  value in every vectors in object should correspond to the same element from the original data.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
require(matrixStats)
set.seed(123)
mat = matrix(rnorm(1000), nrow = 100)
lt = list(sd = rowSds(mat), mad = rowMads(mat))
top_elements_overlap(lt, top_n = 25, method = "venn")
top_elements_overlap(lt, top_n = 25, method = "correspondance")
```

---

top\_rows\_heatmap-ConsensusPartitionList-method

*Heatmap of top rows from different top-value methods*

---

**Description**

Heatmap of top rows from different top-value methods

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'
top_rows_heatmap(object, top_n = min(object@list[[1]]@top_n),
  anno = get_anno(object), anno_col = get_anno_col(object),
  scale_rows = object@list[[1]]@scale_rows, ...)
```

**Arguments**

object	A <a href="#">ConsensusPartitionList-class</a> object.
top_n	Number of top rows.
anno	A data frame of annotations for the original matrix columns. By default it uses the annotations specified in <a href="#">run_all_consensus_partition_methods</a> .
anno_col	A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.
scale_rows	Whether scale rows.
...	Pass to <a href="#">top_rows_heatmap,matrix-method</a>

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**See Also**

[top\\_rows\\_heatmap](#), [matrix-method](#)

**Examples**

```
# There is no example
NULL
```

---

top\_rows\_heatmap-dispatch

*Method dispatch page for top\_rows\_heatmap*

---

**Description**

Method dispatch page for top\_rows\_heatmap.

**Dispatch**

top\_rows\_heatmap can be dispatched on following classes:

- [top\\_rows\\_heatmap](#), [matrix-method](#), [matrix-class](#) class method
- [top\\_rows\\_heatmap](#), [ConsensusPartitionList-method](#), [ConsensusPartitionList-class](#) class method

**Examples**

```
# no example
NULL
```

---

top\_rows\_heatmap-matrix-method

*Heatmap of top rows from different top-value methods*

---

**Description**

Heatmap of top rows from different top-value methods

**Usage**

```
## S4 method for signature 'matrix'
top_rows_heatmap(object, all_top_value_list = NULL,
  top_value_method = all_top_value_methods(),
  bottom_annotation = NULL,
  top_n = round(0.25*nrow(object)), scale_rows = TRUE)
```

**Arguments**

object	A numeric matrix.
all_top_value_list	Top-values that have already been calculated from the matrix. If it is NULL the values are calculated by methods in top_value_method argument.
top_value_method	Methods defined in <a href="#">all_top_value_methods</a> .
bottom_annotation	A <a href="#">HeatmapAnnotation-class</a> object.
top_n	Number of top rows to show in the heatmap.
scale_rows	Whether scale rows.

**Details**

The function makes heatmaps where the rows are scaled (or not scaled) for the top n rows from different top-value methods.

The top n rows are used for subgroup classification in cola analysis, so the heatmaps show which top-value method gives better candidate rows for the classification.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
set.seed(123)
mat = matrix(rnorm(1000), nrow = 100)
top_rows_heatmap(mat, top_n = 25)
```

---

top\_rows\_overlap-ConsensusPartitionList-method

*Overlap of top rows from different top-value methods*

---

**Description**

Overlap of top rows from different top-value methods

**Usage**

```
## S4 method for signature 'ConsensusPartitionList'
top_rows_overlap(object, top_n = min(object@list[[1]]@top_n),
  method = c("euler", "venn", "correspondance"), ...)
```

**Arguments**

object	A <a href="#">ConsensusPartitionList-class</a> object.
top_n	Number of top rows.
method	euler: plot Euler diagram by <a href="#">euler</a> ; venn: plot Venn diagram by <a href="#">venn</a> ; correspondance: use <a href="#">correspond_between_rankings</a> .
...	Additional arguments passed to <a href="#">plot.euler</a> or <a href="#">correspond_between_rankings</a> .

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <[z.gu@dkfz.de](mailto:z.gu@dkfz.de)>

**See Also**

[top\\_elements\\_overlap](#)

**Examples**

```
data(cola_r1)
top_rows_overlap(cola_r1, method = "venn")
top_rows_overlap(cola_r1, method = "correspondance")
```

---

top\_rows\_overlap-dispatch

*Method dispatch page for top\_rows\_overlap*

---

**Description**

Method dispatch page for top\_rows\_overlap.

**Dispatch**

top\_rows\_overlap can be dispatched on following classes:

- [top\\_rows\\_overlap,matrix-method,matrix-class](#) class method
- [top\\_rows\\_overlap,ConsensusPartitionList-method,ConsensusPartitionList-class](#) class method

**Examples**

```
# no example
NULL
```

---

top\_rows\_overlap-matrix-method

*Overlap of top rows from different top-value methods*

---

## Description

Overlap of top rows from different top-value methods

## Usage

```
## S4 method for signature 'matrix'  
top_rows_overlap(object, top_value_method = all_top_value_methods(),  
  top_n = round(0.25*nrow(object)),  
  method = c("euler", "venn", "correspondance"), ...)
```

## Arguments

object	A numeric matrix.
top_value_method	Methods defined in <a href="#">all_top_value_methods</a> .
top_n	Number of top rows.
method	euler: plot Euler diagram by <a href="#">euler</a> ; venn: plot Venn diagram by <a href="#">venn</a> ; correspondance: use <a href="#">correspond_between_rankings</a> .
...	Additional arguments passed to <a href="#">plot.euler</a> or <a href="#">correspond_between_rankings</a> .

## Details

It first calculates scores for every top-value method and make plot by [top\\_elements\\_overlap](#).

## Value

No value is returned.

## Author(s)

Zuguang Gu <z.gu@dkfz.de>

## See Also

[top\\_elements\\_overlap](#)

## Examples

```
set.seed(123)  
mat = matrix(rnorm(1000), nrow = 100)  
top_rows_overlap(mat, top_n = 25)
```

---

[.ConsensusPartitionList

*Subset a ConsensusPartitionList object*

---

## Description

Subset a ConsensusPartitionList object

## Usage

```
## S3 method for class 'ConsensusPartitionList'
x[i, j, drop = TRUE]
```

## Arguments

x	A <a href="#">ConsensusPartitionList-class</a> object.
i	Index for top-value methods, character or numeric.
j	Index for partition methods, character or numeric.
drop	Whether drop class

## Details

For a specific combination of top-value method and partition method, you can also subset by e.g. `x['sd:hclust']`.

## Value

A [ConsensusPartitionList-class](#) object or a [ConsensusPartition-class](#) object.

## Author(s)

Zuguang Gu <z.gu@dkfz.de>

## Examples

```
data(coLa_r1)
coLa_r1[c("sd", "MAD"), c("hclust", "kmeans")]
coLa_r1["sd", "kmeans"] # a ConsensusPartition object
coLa_r1["sd:kmeans"] # a ConsensusPartition object
coLa_r1[["sd:kmeans"]] # a ConsensusPartition object
coLa_r1["sd", "kmeans", drop = FALSE] # still a ConsensusPartitionList object
coLa_r1["sd:kmeans", drop = FALSE] # still a ConsensusPartitionList object
coLa_r1["sd", ]
coLa_r1[, "hclust"]
coLa_r1[1:2, 1:2]
```

```
[[.ConsensusPartitionList
```

*Subset a ConsensusPartitionList object*

---

### Description

Subset a ConsensusPartitionList object

### Usage

```
## S3 method for class 'ConsensusPartitionList'  
x[[i]]
```

### Arguments

x	A <a href="#">ConsensusPartitionList-class</a> object.
i	Character index for combination of top-value methods and partition method in a form of e.g. sd:MAD.

### Value

A [ConsensusPartition-class](#) object.

### Author(s)

Zuguang Gu <z.gu@dkfz.de>

### Examples

```
data(coala_r1)  
coala_r1[["sd:MAD"]]
```
